The Centennial.

FARMERS AND THE CENTENNIAL.

THE AGRICULTURAL BUILDING.

When Emerson wrote the commemorative poem on the battle of Lexington, no more noteworthy lines appeared than these:

"Here's where the embattled FARMERS stood,
And fired the shot heard around the world."

The Revolutionary contest one hundred years ago was largely conducted by farmers, with its illustrious leader, General Washington, better known in those days as the farmer and land surveyor of Virginia. Israel Putnam was an illustrious representative of the Ruralists of the North. Most of the battles of the Revolution were fought by men who left their plows in the furrow, and their business to care for itself, while they perilled all to secure our independence.

It is entirely fitting that in the Centennial Celebration of the results then achieved, the farmers of the United States should be represented in fair proportion to their numbers, wealth, and industrial importance. Besides, one hundred years of Agricultural Progress and Improvement represent advances equal in interest, and not inferior in value and importance to those achieved in thought, science, and mechanism. Many novel and wonderful inventions have been recorded within the last hundred years; but, after all, the improvements which affect the cheaper production of food form the basis on which all progress must ultimately rest. There may be doubt as to the value of almost any class of inventions to mankind, but it will always hold true that "he who makes two blades of grass grow where one grew before," is a public benefactor.

The Board of Centennial Commissioners have made ample provision for a full exhibition of Agricultural Progress. The Agricultural Building of the Exhibition, illustrated below, is a magnificent structure, giving ample room for the purpose, and will be not the least thronged portion of the Exhibition grounds. It stands on the east side of Belmont Avenue, in the immediate vicinity of buildings devoted to Horticulture, and the yards for the show of Horses, Cattle, Sheep, and other live stock. The building is to be entirely of iron and glass, and consists of a long nave, crossed by three transepts, both nave and transept being composed of Howe truss arches of a gothic form. The nave is 820 feet in length, by 125 feet in width, with a hight of 75 feet from the floor to the point of the arch. The central transept is of the same hight, and has a breadth of 100 feet, the two end transepts being 70 feet high and 80 feet wide.

The four courts inclosed between the nave and transepts, and also the four spaces at the corners of the building, having the nave and end transepts for two of their sides, will be roofed to form valuable spaces for exhibitors. Thus the ground plan of the building will be a parallelogram of 540 by 820 feet, and covering a space of more than ten acres of ground. Present indications are that this vast space will all be needed.

Besides this building devoted to American Agriculture, several countries have signified their intention to erect buildings representing their agricultural interests. Many of these will be attractive specimens of architecture, and will add much to the appearance of the grounds. It is proposed that these buildings shall be located in the vicinity of the Agricultural Building, so that those interested especially in farming can compare the ideas and methods of different countries with the least trouble. The information thus to be obtained will well repay the cost and trouble of a visit to Philadelphia, and we doubt not that hundreds of thousands of farmers in distant portions of our country will make the trip at some time during the coming season. A Centennial Exhibition of our Country's Independence is something that must be attended to now or never.

The Horseman.

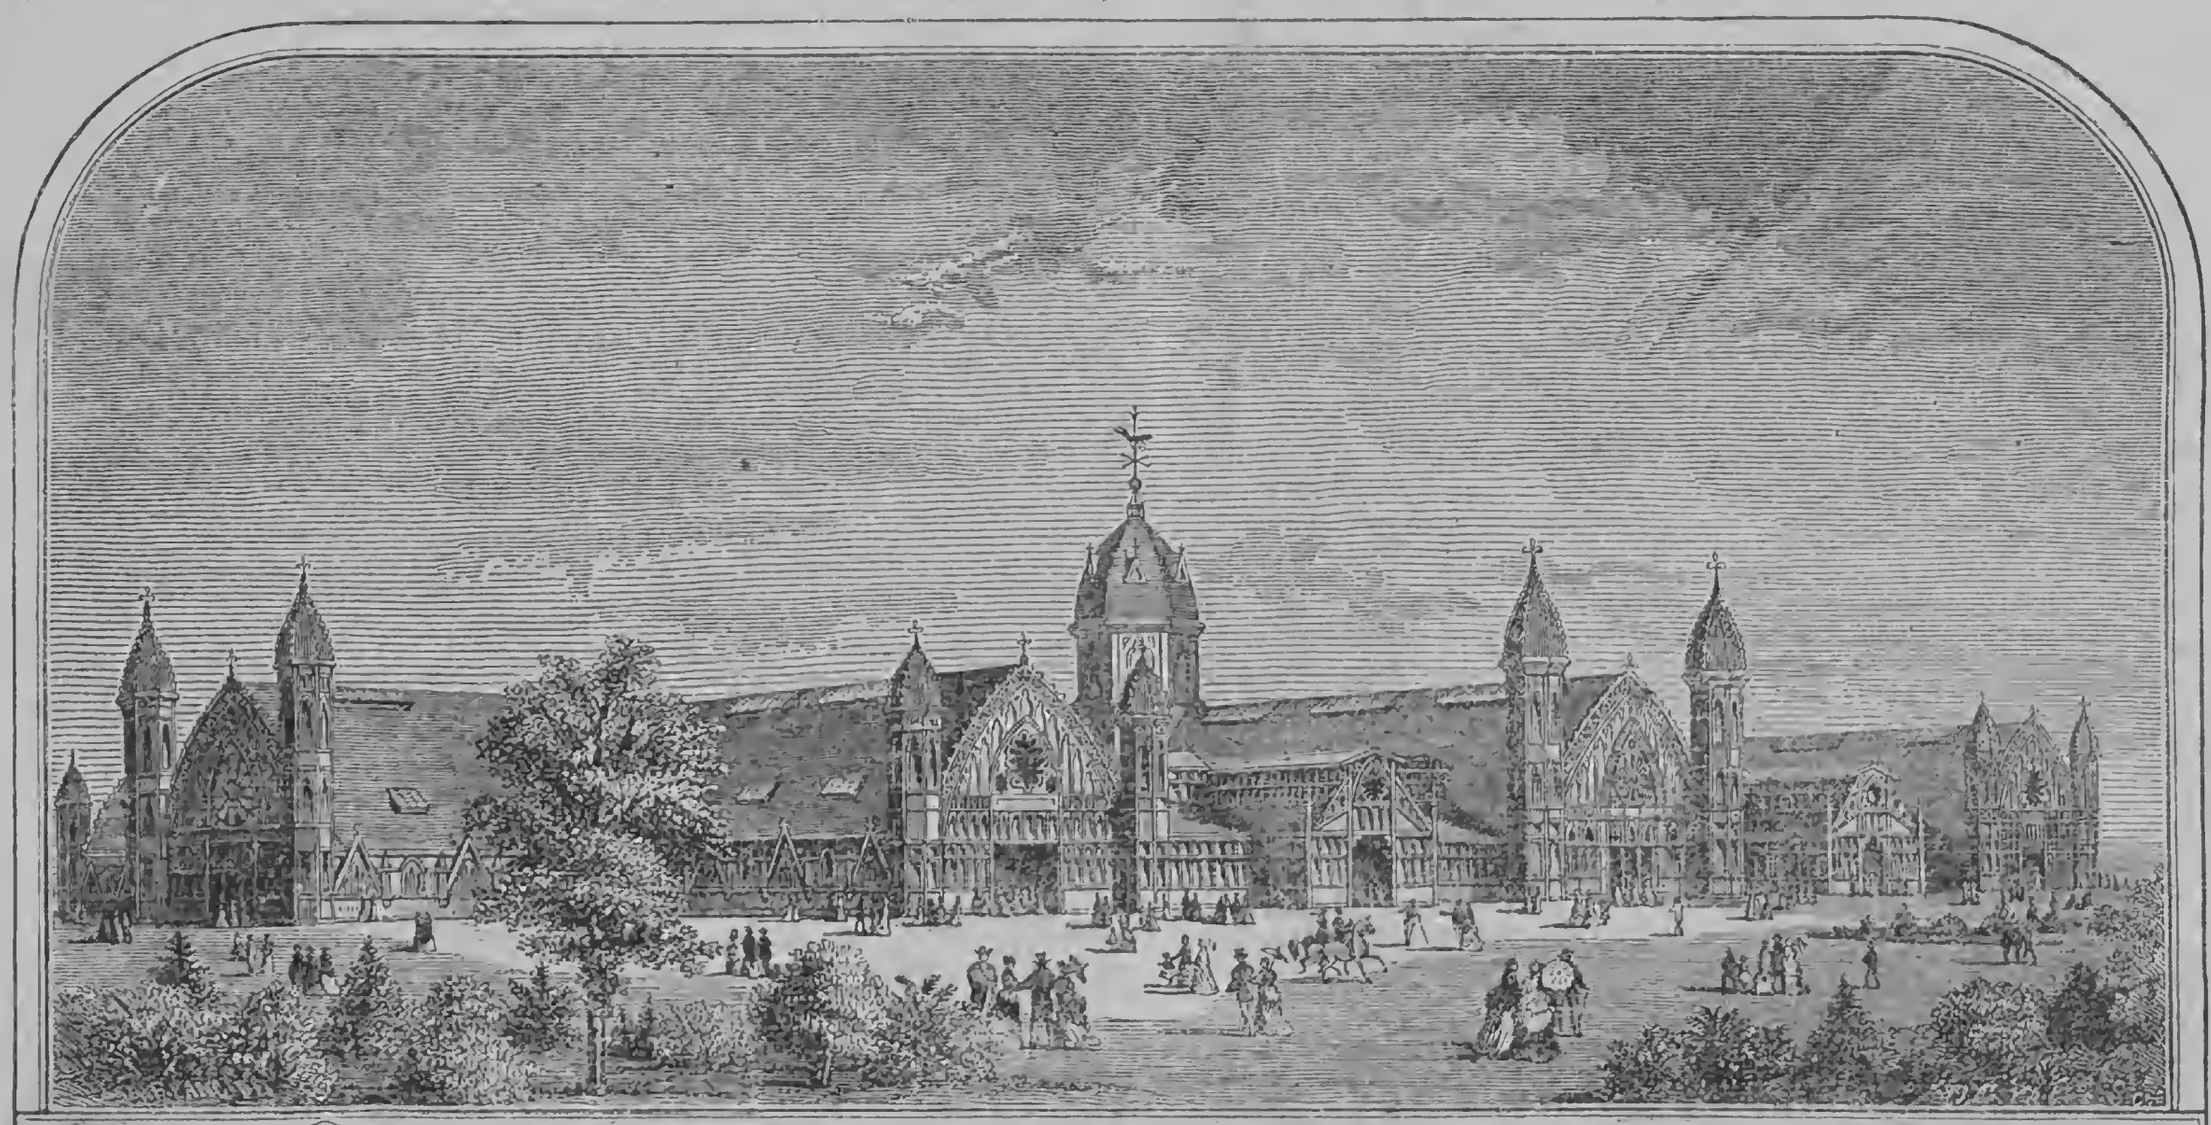
BREAKING COLTS.

An old saying is, "Live and learn," and to-day my son taught me something I had forgotten. I set him to break a colt rising three years old, which, being by a fast trotting horse, has been saved entire. He had never been touched by any one, being as wild as any animal could be. My son, with a man to help, put on a head-stall, with a long rope attached, which they did in a stable after he had been separated from the company he had been lying with all summer. He was then moved about till he discontinued hanging back, which he persisted in doing for nearly two hours, when, as his neck probably began to get tired of the strain and he found by sundry plunges that there was no getting away, he commenced to walk along quietly, and then a collar was first put on, and at intervals, as he cooled off and submitted to be handled all over, harness was put on, so that by dinner time he had drawn a log of wood three-quarters of a mile and back again. He was then put into the stable, where he ate the usual quart of oats he ever had and also a little hay, after which old "John"—a steady, heavy, fine cart horse—was hitched into a stone boat, with the colt at his side, and after one hour's hard walking around a paddock the two were put to a wagon, and they went a distance of two miles to some oat stacks which had been pulled by some steers having broken down the rails, and about half a load of loose oat straw was brought home, and his coltship seemed perfectly quiet and willing to move as guided, so that, instead of waiting to go day by day in training, it was done hour by hour, and judging from his lack of fear and apparent liking to be brushed and cleaned, it is probable he will do half a day's work to-morrow quite as tractably as if he had been in hand days instead of hours. I shall have him work about three days a week, so as to keep him growing and looking in good condition. We worked a filly in the above manner last winter and turned her to grass in the spring. She is now doing regular work and is a very fine animal; but in that instance we took days to do what has been done since morning. I recollect now that years since, when I farmed in England, that although it was a month's job to break a nag, there being regular colt breakers by profession, who got them quiet to ride and with good mouths, yet the cart horse breed of colts had a more summary way of breaking than the one just related, for as horses are worked a good deal there three or four in length, one before the other, the colt was haltered and forcibly pushed to the horses, and two before and one behind started to work, with a man on each side to keep him straight, which, as the horses kept regularly walking on, was not a difficult job. Of course there would be a deal more trouble with some than with others; but after finding there was no escaping, most of the colts would soon become docile, and often there would be one which would walk away from the first and give no trouble, the men walking on each side having, so that the regular driver would be all required to mind him.

Now. 18.—The colt has worked half a day, again going quietly and actually standing instead of a horse hauling corn stalks. He did not sweat, and he would have been shod only the blacksmith was too busy otherwise to do it to-day. Advocates for handling colts from the time they are weaned won't like to read of such dispatch.

A Working Farmer.

For a Cribbing Horse.—Feed with a nose-bag and give hay only from an iron rack. Coating the woodwork in a manger with crude petroleum is also recommended. The bad taste will soon cure the animal of all desire to bite his crib.



1776 AGRICULTURAL BUILDING. 1876

Field Crops.

POTATOES IN MICHIGAN.

B. HOLLOWAY writes from Cass County Michigan to the Country Gentleman about the Potato crop in that State in 1875, and giving his experience with several new varieties.

It is generally believed that there has been produced in this State a larger crop of potatoes than was ever known before. This may be true, and yet, now that the crop is gathered, I find that a large deduction has to be made from the estimate a few weeks ago. This is true with regard to my crop, which, though in the main magnificent, was not so large by one-third as I anticipated. Where the land was rich and lay high, and was thoroughly tended, so that all the warmth from the sun was economized, the yield was wonderful, while in the same field, where the ground was lower, or not so well enriched, or was shaded a part of the day, the crop was comparatively poor.

It seems a little sad that the highest success should appear to some to work ill fortune, as is the case in the production of our immense crop of potatoes. The price, so far, has not been such as to warrant the shipping to any great distance, and many farmers are discouraged with the prospect, and will feed, or have already fed out, the greater portion of their crop. For one, I believe the potatoes we have grown will all be needed before another crop is grown, and at prices that will pay for raising. Among the causes that will produce this result are these:

Farmers will not, as a rule, dig and house as carefully as when the crop is meager. Many will be fed to stock, many will be lost by freezing, and there will be a much greater consumption generally, resulting from their cheapness, and not the least, their unusual excellence. But whether we get pay for the crop we have grown this year or not, all men will not be deterred from growing potatoes, another year, and this leads me to the consideration of the value of some of the new sorts, and of my experience with them.

Compton's Surprise.—This season the Compton was my staple crop, very large; of the best quality, and cooking white and flowry to the center. I think this potato is destined to become a standard root, the more especially as it is one of the best, if not the best keeper we have, cooking flowry and nice until potatoes come again.

Brownell's Beauty.—Of this remarkable potato I raised 2,160 pounds from 20 pounds of seed. There are bushels of them that weigh each from one to two pounds and over, and some as much as three pounds. Even where they grew so large they are seldom otherwise than smooth and fair. This variety well merits the name of Beauty. As to quality, I think it must satisfy all who are content with the Peach Blow, being equal, if not superior to this old favorite, not to speak of its greater productiveness and finer form.

Brownell's Eureka.—As this new sort was sent out last spring at $5 a peck, I invested with some distrust. The result has, however, been most satisfactory. From 15 pounds of seed I grew something over 1,500 pounds of potatoes; and, though I did not count them, I am sure that there are not (counting the very least) as many tubers as there are pounds. Every one that saw them said—"Wonderful! But they will be watery," or "they will be hollow." I had five cooked for dinner, to which more than a dozen sat down, and there was abundance and to spare. No one said—"Give me a potato, please;" but "I will thank you for a piece of potato;" and the verdict was—that they were most excellent. They cooked flowry and dry to the center, without a sign of hollowness.

Carpenter's Seedling.—This has been before the public longer than the preceding, and finds many admirers. The quality, with me, is not quite equal to the Early Rose, as the Early Rose is this year. But the Carpenter is very smooth and handsome, and this year very productive. I raised from 15 pounds of seed 1,800 pounds of potatoes.

Ohio Beauty.—This new sort, sent out by George. W. Campbell of Ohio, I had on trial this season. It produced for me something over 1,500 pounds from the peck of seed. The tubers are of good shape, though not as uniform as Brownell's Beauty. It is as late as the Peach Blow, which may or may not be in its favor. I think it worthy of further trial.

Snowflake.—This, like the above, was sent out last spring at $5 a peck. If I was in the practice of classifying potatoes, as I do fruit, as "amateur," or "market." I should call this an amateur sort. The yield was only about 15 bushels to a peck of seed, or only half that of Carpenter's seedling; but the quality is all that was claimed, boiling or baking as white and fine as the Long Pinkeye in its best estate. And its good shape adds to its popularity.

Ice Cream, Red Jacket and Early Monsees.—The yield of the first of these was about the same as the preceding, and the quality nearly equal, but the shape is less uniform. The second was not so good, though yielding about the same, and the last in addition to lack of quality, is hard to dig. I shall not grow them again, which sufficiently indicates my opinion of their value.

If, as is claimed, these new varieties of the potato have resulted from the stimulus given to cultivators for the production of new sorts, by the failure of the old kinds, the disease, in its results in this country at least, can hardly be looked upon as a misfortune; for in some of these new varieties we have all the excellences of the old, together with certain characteristics of vigor and health that those did not possess. The question may be properly asked—will these new sorts supersede the Peachblow as a market potato? If the yield alone was the test, or yield and quality, there is no doubt but several of the new sorts would become popular as market potatoes at once. The Peachblow is prized not alone for its productiveness, nor yet for its quality, but quite as much, no doubt, because it will withstand rough handling better than most sorts.

I find the finer the quality, the more care is requisite in the storage or transportation. The Brownell's Beauty and Ohio Beauty, being in character something like the Peachblow, will bear transportation about as well. The Compton is more tender, but not so much so as to hinder its shipment by rail. The Eureka is however, more tender than either; and as it grew so large, I had to handle it with a good deal of care in order not to break and mar the tubers seriously. This, however, would not detract from its value for home use, or a near market, where quality would enter more into the estimate of value.

THE COST OF GROWING COTTON.

COL. HARDAWAY of Thomas Co., Georgia, gives the following estimate of the cost of cotton per pound, which we find in the Southern Farmer. He says:

"I give the cost for seven years to wit:—1866, 14.50; 1867, 12.50; 1868, 12.25; 1869, 10.90; 1870, 8.60; 1871, 13.61; 1872, 10.77. The average is 11.88. This includes interest on value of land, repairs, interest on team, taxes, fertilizers, labor of cultivating, picking and packing, but nothing added for personal supervision. The latter would be hard to estimate. This year's crop has not been marketed but will not exceed ten cents.

The Southern Farmer says these estimates do not include cost of superintending, or for borrowed money to make the crop. Adding these the cost of cotton usually exceeds the price received, making the business unprofitable. The Farmer adds:

"We advise all our friends, in the beginning of the new year, to prepare to raise their own meat and bread—to work no more hands or mules than they have the ready means to operate profitably—to work hard and live at home, and grow cotton only as their surplus money crop, and they can scarcely fail to come out far better off than by raising all cotton and buying all their supplies from the more prudent farmers of the Northwest.

LARGE YIELD OF RYE FROM ONE SEED.

DEAR SIR:—A farmer brought into my mill, the other day, a bunch of rye stubble in which I counted one hundred and nine (109) stalks. Did they all come from one kernel of rye? It grew on a piece of new land, sowed to wheat, and there was a little rye in the seed. The wheat killed out. Where the wheat did not kill out there was only now and then a bunch of rye. Some of my customers who have seen this think that there was a rye head from which these bunches came, but this could not be as they had never raised any rye on the farm before and never as a crop.—LUCAS SMITH, *Shortsville, N. Y.*

WE see no reason for doubting that the product was from one grain. It is a large yield, but on new ground well prepared for wheat, and leaving the rye plant standing alone is not beyond a reasonable probability. It shows how large a product can be got from thin seeding if every plant has a fair chance.—EDS.

WHEAT SOWING IN WET SEASONS.

T. C. SCHOLEY of Yorkshire, England, writes in the London Agricultural Gazette of Nov. 20, that much wheat remained unsown in England at that late date on account of the continued wet weather. His plan of sowing wheat is to make it follow potatoes, of which he grows 130 acres yearly. The ground is lightly plowed, the seed sown evenly on the furrows and lightly harrowed in keeping the sowing close up to the plowing. The light plowing enables the farmer to sow on land too wet for ordinary working, and by using a gang plow, the land is less tramped down than when a heavier plow is used.

The Herdsman.

MILCH COWS A LABORATORY.

PROF. WETHERELL writes in relation to this subject as follows:—Having decided on the breed of cows you will keep as one engaged in dairy husbandry, consider every cow a machine to convert forage such as your farm produces into milk. To illustrate. Call the cost of a cow $50, $75 or $100. Take the latter figure. This machine must be kept running day and night, summer and winter, on Sundays as other days. Suppose it takes fifteen pounds of hay a day to run this machine twenty pounds if she be not comfortably housed in cold weather; say from two and a half to three and a half tons of hay a year will serve to keep the machine running. If not thus furnished your machine will stop, or like your clock, it will run down if not wound up, so to speak. The machine cost $100, and will last seven or eight or ten years, more or less, if no accident happen to it. Suppose twenty pounds or its equivalent be required to keep the cow alive, then the owner gets nothing in the way of profit. Give her twenty-five pounds and she gives five pounds of milk, equal to one-half pound of cheese a day. He gives her thirty pounds and gets one pound of cheese a day, or 365 pounds in a year, or that average. Twenty pounds gave him nothing; twenty-five pounds, one-half pound of cheese; thirty pounds or sixty-six and two-thirds pounds of cheese from a ton of hay; thirty-five pounds give one and a-half pounds of cheese, or eighty-five and five-sevenths pounds to a ton of hay; forty pounds give two pounds, or one hundred pounds of cheese to a ton of hay; forty-five pounds give two and a-half pounds of cheese, or one hundred and eleven pounds of cheese from one ton of hay; fifty pounds give three pounds of cheese, or one hundred and twenty pounds to a ton of hay.

On this hypothesis, suggested by another, a ton of hay in excess of the amount necessary to keep up the animal heat and sustain vitality gives 200 pounds of cheese. Thus is it seen that it is desirable to get cows that will yield most over the cost of the keep or the running of the machine. If a cow eats but twenty-five pounds a day it takes a ton of hay to make forty pounds of cheese. Could she eat and assimilate fifty pounds a day a ton would produce 120 pounds of cheese. If a cow eats thirty-three pounds a day or its equivalent of grass it will require four acres, at one and a-half tons per acre, to keep a cow a year, which, according to the present hypothesis, would produce 401½ pounds of cheese a year. A farm of eighty acres would support 20 cows, yielding 8,000 pounds of cheese. Increase the productiveness of the farm one-half, and keep twenty cows that will eat one-half as much again food, and the farmer would then get 21,600 pounds of cheese. If the cheese be worth fifteen cents a pound, a farm of eighty acres, at one and a-half tons per acre, with twenty cows, would give a return of $1,201.50. Increase this by improvement to two and a quarter tons per acre, the twenty cows eating and digesting it, you would have a gross return of $3,240. Thus is it shown that a cow eating six tons of hay or its equivalent a year would produce 400 pounds of cheese per annum, worth $60, while a cow eating and digesting nine tons would produce 1,019 pounds, worth $163.50.

EARLY MATURITY OF A CALF.

THE following is an account of a Grade Durham Calf, which was dropped the first of April, 1875, and raised until it was 5 months and 9 days old, by Mrs. CHAMBERLAIN of Portage, Prairie St., Joseph Co., Ind. It was slaughtered and dressed by C. VINSON of South Bend, Ind., the 10th of September, 1875, and weighed as follows: The 4 quarters of meat weighed 368 pounds; hide 49 do.; rough tallow, 35 do.; making for beef hide and tallow 452 pounds, allowing for the head, feet and other offal 113 do.; would make the live weight, 565 pounds.

The calf ran with the cow for a few days, when it was turned into an orchard pasture containing many sweet apple trees, and the cow turned in with the calf, night and morning so that the calf took nearly and sometimes all of the cow's milk. This, with the sweet apples which fell from the trees, and the pasture in the orchard, constituted all the food the calf received. And yet at the age of 5 months and 9 days its live weight must have been about 565 pounds. The hind and fore quarters were large and fat, and the kidneys plump and handsome. Now had this calf been kept three weeks longer until it was 6 months old, at the same rate of increase, it would have weighed 625 pounds live weight, and have been almost equal to the steer, Uncle Abe, raised by C. S. MARVIN of Orange Co., State of New York, of which a full account is given on Page 250 of the Agricultural Report for 1871, the weight of which was as follows, viz., at birth, 134 pounds; at 6 months of age, 670 do.; at 12 months, 1,036; at 18 months, 1,354; at 24 months, 1,616; at 30 months, 1,830; at 36 months, 2,070., and should have been slaughtered when from 18 to 36 months of age. It was kept until it was 52 months old, when its live weight was 2,530 pounds. For the manner of feeding, and further particulars about its weight at different times, see the report above referred to, page 250.

Both of the above accounts clearly show, the great advantage of early fattening. The beef would be more tender, cost less to make it, and sell for a higher price in market. The stock grower could also turn his capital twice as often, thereby saving g large item of interest.

It would also seem as if sweet apples contained a large amount of fat-forming material, and if so, then why not feed, for fattening purposes, other sweet food, such as sugar beets, sweet corn meal, sweet corn stalks, and the like?

ISAAC ESMAY.

The Apiarian.

THOUGHTS ON WINTERING BEES.

L. F. ABBOTT is contributing a series of articles on bee keeping to the Maine Farmer, which introduce some sensible ideas. The great mortality among bees, of late years, from cold, is much greater than formerly, and Mr. A. suggests that it is caused by the different styles of hive—a subject certainly worthy of consideration by bee keepers. He says:

"A swarm of bees in the moveable comb hive is in an abnormal condition. The instinct of the bees leads them to so construct the combs when left to follow their instinct so that they are a safeguard against the rigors of winter. The bee keeper, for good reasons, says: 'If I let my bees follow their own inclination, and construct the combs to their liking, it frustrates my plans and deprives me of my profits. I will modify, somewhat, the plans nature has instructed them to carry out in this particular of comb-building, and make them subserve my interests *at the risk* of losing at some other point.'

"It is our belief that bees need different treatment in winter in frame hives, from what they do in the old box hive. With combs nearly straight from rear to front, with unfilled space at each end of the frames, the hives are necessarily much colder, and not only that, but the bees cannot cluster so compactly with combs in such shape, and if spread out between four or five straight sheets of comb—the changes in temperature of our winters affect them much more if no method for giving protection is adopted. We claim that bees will winter as well now as they did fifteen years ago, if placed in the same condition as then. Let us consider for a moment the manner in which bees, that are allowed to follow their own instinct, construct their combs. We have had occasion lately to dissect several old box hives, removing the comb and bees in order to obtain the latter for strengthening some of our own swarms. Two or three old swarms had occupied their hives some twelve or fifteen years. All the profit derived from them had been by the increase of swarms; but what is noticeable in such cases, is the curious manner of building the breeding apartment, or, as it may be called, the "living room" for the swarm. The combs in the upper part of the hive are placed in quite regularly, as this is the store-room; but when we come to the brood nest, we find it as dissimilar from straight combs in the modern frame hive as it is possible to conceive.

"Instead of the regular sheets built from side to side, or from corner to corner, as is often the case, we find more or less of them curved. For instance, a sheet commenced at some point (as the back of the hive) is carried parallel to the side till a point about the center of the hive is reached, when it is curved and brought to a right angle with the starting point, and perhaps is completed a little past the center of the hive; and another sheet passes at this point at an angle with the other sheet, and then at the points where these nearly intersect it will be seen there is much more space than if the combs were carried straight and parallel to each other. This arrangement allows the building of quite a number of small sheets of combs in many irregular forms, and the whole protected with the larger sheets, thus giving compactness to the cluster of bees in cold weather, which it is impossible for them to assume in perfectly straight combs. Nor is the ample space afforded by this arrangement all.

"Nearly all these inner combs are pierced with holes from the size to admit a bee to pass readily to an inch in diameter. And thus the interior of this "living apartment" is full of galleries and halls, and all, so to speak, are amply provided with large folding doors, so that neighbors can readily make friendly calls and not be too ceremonious, and have to ring the bell every time. Bees generate much warmth if they can cluster together in large numbers, but spread them out and frequent chilling destroys them."

[Concluded from page 411, last volume.]

THE PRICES FOR 1875.

At the interior markets we commenced selling cheese in April, 1875, at an average of 15c. On the tenth of May it had dropped to 14½c., and during the last of the month there was a further decline from 11½c. to 12c. During June, from 12c. to 13c. were paid, but in July it dropped again to 11½@12½c.; in August, 11¾@12¼c.; in September, 10½@11½c., except during the last week, when 13@14c. was reached on extra lots; in October, 13@14c. paid, and in November 12@13c., the market being very dull and depressed.

You need not be told that these prices have been very unsatisfactory to dairymen, and that on many farms no money has been made. You must have observed, also, that all over the country, and not confined exclusively to dairy sections, an unusual number are offered for sale, and many, I am sorry to say, are advertised under mortgage foreclosures. There are murmurings all through the State that farming has reached a close thing and that there is little or no money in it.

A BAD LOOK—GOOD FARMING THE REMEDY.

Now at first sight this may seem to have a bad look for the future, but if we probe to the bottom of the subject, the way out of the difficulty is not so dark and intricate as many suppose. Farmers have been getting high prices for some years and the effect has been to relax their energies, to pay less attention to the details of farming, to spend more time from home and to indulge in elegant equipages and other kinds of extravagance, expecting the farm to run itself and meet all obligations. Low prices, therefore, pinch sharply and hurt. No: the true way to counteract the influence of low prices is in better farming. Ten to one, those who sell the farm and abandon the business on account of low prices, are making a mistake which they will see more plainly when the remaining part of their surplus accumulations have taken wing and departed, as will be very likely to happen. Is it not better to stand manfully at the helm and try to get the ship back again into deep water?

THE MISTAKES OF DAIRY MANAGEMENT.

One great evil of dairy farming is that dairymen have allowed the annual product of their herds to run too low. The average factory returns will scarcely show an annual yield of 400 pounds of cheese to the cow. In a great many instances it will not go much above 300 pounds. It ought to be at least 550 or 600 pounds, and 600 pounds of cheese at 10c. per pound amounts to the same sum as 400 pounds at 15c. Farmers say that if they can get 15c. per pound for their cheese dairying pays well at 400 pounds to the cow. If this is so, 600 pounds to the cow at this year's rate, would have yielded a very handsome profit. I am not suggesting any imaginary or impracticable figures in the yield of herds. I have for years been able to go about 550 pounds of cheese in my own dairy, and not unfrequently have touched a point above 600 pounds, and this, too, with the common stock of the country; but most of them were bred on the farm and were descended from what is known as the Old Dutch Cow of the Mohawk Valley. These results, however, were obtained only when I gave personal inspection to details and farm management, and when I fell into tenant farming a remarkable shrinkage occurred. I can name dairymen in every County who were accustomed to get better returns from their cows than I did, and hence I feel warranted in giving you the figures I have named. And let me say to you, it makes a very great difference in the profits of dairying whether a cow yields a profit of 400 or 600 pounds, because the gain above a certain point (which must be placed to the account of expenses) can be credited to clean profit. The 200 pounds extra then represents actual savings, and is like so much money placed to your credit in bank.

BUYING FROM DROVES—RAISING STOCK RECOMMENDED.

Dairymen of late years have got into the habit of filling up their herds from droves, and a large share of the arrivals bought are "culls," being the poor milkers from different dairies scattered over the country. We must return again to the good old practice of raising our own cows on the farm. Let the calves be selected only from the best milkers, and in the choosing of males more attention must be paid to the milking habit of the family from which it is descended. There are many thoroughbred animals with long pedigrees that are of no value in the dairy. If they are from very poor milkers they are very likely to transmit that quality to their offspring, and hence they are not infrequently less useful than the scrub that has a good milking parentage from common cows. I have seen some Short-Horns that could not be made to yield sufficient milk for the maintenance of their calves. Such families are admirably adapted to the beef grower, but should not be introduced into the dairy, and the same rule applies to other thoroughbreds.

I am not opposed to the introduction of thoroughbred animals for the dairy, and believe that great improvement can be made in our milking stock through such blood; but we must select from good milking families and not from those which have been cultivated for another purpose.

Some people get the notion that a milking habit is built up and produced by extra feeding. If such were the case, the Short-Horns of all families ought to be the best milkers in the world, for there is no stock that has been pampered more by extra feeding than this breed. The old Ayrshire breeders say that you can injure the milking habit of any breed by the excessive feeding of the young animal, and they make a point that Ayrshire calves intended for good milking cows shall be kept only in a fairly thrifty condition and not made fat, as if intended for slaughter. Some of the best cows I ever owned were when calves, after the first three weeks, raised on whey and a little oil meal, with what grass they could pick from sweet, nutritious pasturage.

POOR COWS EAT UP THE PROFITS.

The number of poor cows scattered throughout the State is simply enormous. I know a dairyman in Herkimer County who turned off the past fall 33 cows at an average of about $15 per head, which in the spring had cost him $50 per head, and he will be obliged to fill up again next spring at perhaps $50 per head. Other dairymen winter over their poor cows on the principle that you might as well keep what you have as to run the risk of getting nothing better by selling and filling up again in the spring. I need not say that all these poor cows do not pay the expense of keep and are a heavy burden to carry year after year; and this is one source of useless expense which eats away the profits on many farms. Dairymen say they can buy cows cheaper than they can raise them; but they will tell you that it is almost impossible to buy a line of good cows. Let any one go about the country picking up good cows, and he will find that the number to be had is remarkably small.

A BARBAROUS PRACTICE—IT CAUSES DISEASE.

Again, the practice of carrying cows over long distances in spring, before they "come in milk," is a most cruel and barbarous practice, which ought not to be tolerated in civilized communities. Consider the fright alone from the cars, the shriek of the engine, the clatter of the wheels, and the shock to the nerves of the poor beasts as the trains dash past each other. But in addition, the animals are often over-crowded, often thrown violently against each other or against the car, starved for want of food, maddened by thirst, forced to stand for long periods upon their feet under the swaying motion of the cars—and some faint idea may be had of the sufferings which this traffic imposes. Is it any wonder that abortion and other diseases come as a penalty, and that all through the dairy region of Central New York the complaint grows more and more serious that our cattle are losing their vigor and are more subject to disease and accident than formerly.

I am firmly persuaded that the terrible scourge which has for some years past been so prevalent in Herkimer and the adjoining counties is due to the causes I have named. The losses have been fearfully heavy from this source on many farms, and if we are to get relief it must be by the old practice of raising stock and caring for it in a proper manner.

SOME OF THE OTHER LEAKS IN DAIRY FARMING.

Again, many of the dairymen have fallen into the habit of purchasing from abroad all the grain needed on the farm, and not unfrequently it is said that fruit and many kinds of vegetables can be purchased cheaper than they can be raised. Farmers will tell you, too, that it is cheaper to buy coal than to cut and draw fuel from the wood lot. Is it any wonder that the cost of living is increased tenfold when farmers purchase from abroad what should be raised on the farm?

Dairying, at present prices, cannot pay for all these outgoes on farms intrusted to hired help and when the proprietor neglects the details of farm management. But good farming and good management does pay, and is the only salvation for low prices and dull times.

Gentlemen, I am not discussing these questions from an imaginary standpoint. I have farmed when cheese was 6c. and butter a shilling a pound, and I bought my farm on credit and paid for it by farming. I know that to make farming pay there must be personal attention, economy and brains put into the business, and so I say the dairyman's horizon is not so dark as many suppose, and we can stem this current of low prices if we will.

DAIRYING DOES NOT RUN THE LAND LIKE GRAIN FARMING.

There is one advantage in dairy farming which is scarcely ever estimated at its true value—the better condition it leaves the land in for grain growing. Those who have had experience in renovating old, badly worn-out grain farms well know that it is an expensive and tedious operation.

There is no crop, perhaps, which exhausts the land so little as pasturage, and if meadows are cut in season and properly manured, with all the manure available on the farm, the land may be kept in good heart for a long number of years, and especially is this the case when the aftermath is allowed to rot on the ground.

In England I saw pastures 200 years old that were yielding full crops of rich and nutritious herbage where cattle would fatten rapidly, thus showing that the land had not deteriorated, at least to any great extent.

Nearly all the old dairy pastures can be improved by boning. In 1855 I boned an old pasture at the rate of about 500 pounds crushed bones to the acre, and the grass seemed to start with new vigor, covering the ground like a mat. Boning is rather expensive in the first outlay, but, as the effects will last for 15 or 20 years, the cost is not so very great after all.

Dairy farming then has this advantage, your land capital can be easily kept unimpaired, or be made to grow better, and all improvements of this kind may be credited like so much cash in bank.

CONDENSED MILK.

You will observe that during the past year a great deal has been said in New York City in regard to securing good milk for city consumption, and efforts have been made to establish a standard for pure milk by means of the lactometer test.

Now, I have not one word to say against the lactometer. It is a useful instrument for determining the specific gravity of fluids, but it is asking too much to require it to detect all the frauds of the milk peddlars.

Milk, as is well known, can be skimmed and watered, or it can be doctored with sugar and salt so that in a lactometer test the adulterated article will mark pure milk on the stem of the instrument. The better way, it seems to me, is for city people to get in the way of using plain condensed milk, and if this trade could be generally inaugurated, good, pure milk might be sent from the most distant part of the State and furnished to consumers at much cheaper rates than those which obtain for the poor, watered and often unhealthy article now sold. The plain condensed milk will keep several days in hot weather. About 75 per cent. of water is eliminated, and hence so much bulk is saved in transportation.

City people will never escape the frauds and abuses to which they are subjected in the milk trade until they get in the habit of using condensed milk and when they can add their own water instead of paying eight or ten cents a quart for it to the milkman.

THE DAIRY AT THE WEST.

I have a word also to say about the West and its adaptation to the dairy. The impression has obtained among dairymen of the East that dairying cannot be successfully carried beyond the Mississippi.

I have taken some pains to examine this question, having crossed the continent twice and have traveled extensively in the far West, and I am convinced that there are broad belts of land in this region where dairying may be made a success.

Many of the native or prairie grasses of the West are exceedingly nutritious and they make a good flavored milk.

One leading requisite for good milk is an abundance of clear, fresh water. In Minnesota and Eastern Nebraska the water and grasses are excellent, and these States expressly, it seems to me, afford a fine opening for the prosecution of Dairy Husbandry at a very small outlay of capital.

MARKETING DAIRY BOARDS OF TRADE.

The recent plan of marketing dairy boards of trade has proved eminently successful, and has been of the greatest advantage to dairymen. The inauguration of this system belongs to our State Dairymen's Association. We were the first to originate and perfect the system, and all the other dairy boards of trade, whether in New York or in other States, have been copied from our plan.

The articles of our Association and the rules governing the Board we had printed in circular form for distribution, so that it is quite easy for any section to establish a market on this system, and it would be well for every dairy county in the State to have its Dairy Board of Trade and sell goods at stated intervals and at one place.

In 1864 I began to report the Little Falls dairy market, and this was the first interior market report that had ever been made in this country. Before that time dairymen were obliged to get their market information from the city papers, and, as a consequence, were not well informed in regard to marketing their product. Now, from the reports of the interior as well as the city markets, dairymen have the means of keeping pretty well informed in regard to supply and demand, and the prices that obtain from time to time.

Gentlemen: We have a number of distinguished speakers who are to address you on a variety of topics. They have given these topics much thought, drawn from practical experience and observation, and it is expected that, after each address, time will be allowed to have the subject matter of the address thoroughly discussed. We want the result of your experience, whether it argees or disagrees with that of the speaker. We cannot all think alike, experiences differ, and conclusions are often drawn from the same experience that are wide apart. It is by comparing and sifting the evidence before us that we are able to arrive at the truth, and this is the duty which especially belongs to the Convention. I hope that no statement or opinion promulgating error will be allowed to pass at this Convention without challenge. Let every theory, or plausible explanation of a theory, be closely scrutinised. It is no offense to criticise here in open convention, if it be done in the proper manner and with the view of getting at facts and principles. Earnest discussion is solicited, but it is to be hoped that it may not become so heated as to degenerate into wrangling and personal recrimination. We do not want any one to leave this Convention with a feeling of bitterness or enmity in his heart caused by offensive or unguarded remarks, and I speak of this more especially, because there seems to be some feeling between those representing whole-milk cheese making and those representing the skimmed milk interest.

A great many bitter things have been said in the papers against the manufacture of oleomargarine cheese, and men have been misrepresented and denounced for simply giving the facts in regard to its manufacture. This course has a tendency to keep back and suppress dairy knowledge. What we want at these Conventions is to get all the information possible concerning every branch of the dairy. If any one has a new idea, has discovered a new principle, or has made an invention by which the business may be improved, let him be induced to come here and make the thing known. We want to know all about it, and to keep well up with the progress that is being made from time to time.

At the American Dairymen's Convention, valuable men have been alienated and driven entirely away from the meetings by allowing papers, filled with personalities, to be read and discussed. I hope we shall not fall into the same error. I know there is great difference of opinion in regard to the influence which skimmed cheese may have on the reputation of American cheese. It is said that the manufacture of skimmed cheese, if of any grade of cheese besides that made from whole milk, must lower the standard of our product abroad, and will, in the end, bring disaster upon our export trade. A larger exportation of inferior cheese may reduce the price in that quality, but, as has been shown in the statement made by my English correspondent, *fine* cheese remains uniform in price and is not affected. How, then, are the whole-milk factories to be injured; and will not fine cheese be the more eagerly sought after?

When I was in England, the leading cheesemongers told me they did not care to deal exclusively in fine cheese, a cheap cheese being needed for poor people who could not afford to purchase the more expensive kinds.

In 1866 the English imported about eighty million pounds of Dutch cheese, which is mostly made from skimmed milk, and they continue to import largely of Dutch cheese. If the creameries can put upon the market a cheaper cheese than the whole-milk factories, are they not doing a grand thing for humanity in affording poor people the means of subsistence within reach of their limited means. Is it wise to stop manufacturing cheese from skimmed milk, and thus make a wanton waste of so much good food, while there are millions of people who are pinched for the necessities of life and cannot afford to purchase dear foods.

There are other features to this question which I do not care to discuss. I am not here to advocate skim cheese making, or exclusive whole-milk cheese making, but I want our dairymen to do that which is the best, not only for themselves but for the interests of humanity.

HOW LONG TO MILK A COW.

There seems to be a prevalent idea that it is not profitable to milk a cow more than eight or nine months, and most dairymen dry off their cows early and let them go dry three to four months. Is this the best practice? We think not. A cow is kept for milk. She should be bred for holding out her milk as long as she can, with due regard for health. It has been proved in the case of thousands of cows that have lived to good old age, that they can be bred to give milk ten months in the year, bear a good, healthy and strong calf and be ready for as good a milking season the next year. We should seek such cows and discard those that persist in drying early, even if they do give a good mess for a short season.

Arboricultural.

LOCUSTS—ROBINIA DISSECTA.

The Locusts are greatly neglected as ornamental trees for lawns because their natural form is not attractive. A maximum of long branches and a minimum of foliage, always conspicuous in natural specimens, and the formidable thorns that invest many of the species seem to indicate hedges and obscure situations as their fitting place. Cutting back the main branches of young trees, however, will convert their nude branches and scanty foliage into a thick, spreading head that, covered in spring and summer with pendulous racemes of white, rose and yellow flowers, is in no way inferior to the habit and leafage of many rarer trees which are valued more highly.

Robinia pseud-acacia inermis is a beautiful thornless species, with narrow leaflets and a naturally round, thick head, well adapted to shrubberies of the larger class and quite pleasing and elegant as isolated specimens upon the lawn. A number of other species and varieties are mentioned in catalogues—e. g., *R Bessoniana, bella rosea, splendens* and *Gleditschia sinensis inermis*, to which we call the attention of those who are studying over selections for spring, as well worthy of consideration.

Robinia dissecta, a branch of which is represented in the engraving which we copy from the *Revue Horticole*, presents an instance of dimorphism as shown in the two distinct forms of leaves. "The origin of this remarkable variety of the common *Robinia* is unknown. It forms a shrub or low tree, the branches and twigs of which are small, short, and very numerous. Its appearance reminds one of trees, the leaves of which have been eaten by caterpillars and have thus been reduced almost to mid-ribs. In this, which may be said to be the normal state of the plant, no flowers are produced; but wherever any branches assume the characteristics which belong to the type—a circumstance which rarely happens—they produce blossoms in abundance, as shown in the illustration."

ROBINIA DISSECTA.

TOO MANY VARIETIES.

The following article from the N. Y. Weekly Sun expresses ideas which those intending to plant fruit of any kind should heed:

"Ninety persons out of every hundred who set out trees for home use or for market indulge in too many varieties. This one fatal error has ruined more fruit growers than all other causes combined. Nurserymen propagate their hundreds and thousands of sorts simply because a majority of their customers do not know what they want and will not take the advice of those who do. The prevailing passion with the novice in fruit culture is to try as many varieties as possible; and we have known men who had "just begun," and with very little capital, to go into a nursery and undertake to make a short purse go a long way by purchasing a tree or two of each variety, instead of acting the wiser part, selecting from a number of trees a few of the very best.

"We have also seen the same thing done in purchasing flowering plants, and our florists try to accommodate their customers; hence the immense number of varieties kept for sale. It is well enough for nurserymen to try all the new sorts, to find out which are the best, as it is part of their business; but the man who cultivates fruit for profit had better confine himself to only a few, and those known to be adapted to his soil and climate. Our pomological, horticultural and agricultural societies are perhaps somewhat at fault in this matter, for they invariably offer the largest premium for the greatest number of varieties, and it is not strange that there should be some strife for the highest prize. The man who only exhibits a dozen varieties of pears by the side of another who spreads out a collection of 200 or 300 appears to be rather 'small potatoes,' although he may be in reality the more extensive cultivator of the two, and deserves more credit for possessing wisdom enough to avoid such indiscriminate planting of second-rate sorts. The great number of varieties certainly make a good show on the exhibition tables, and sound well in print, but this is all that can be said in their favor.

"We have been all through this variety fever, from a thousand pear trees down to a thousand sorts of strawberries; therefore we can speak from experience. If our own was not enough to convince us of the folly of planting too great a number of varieties, that of hundreds of others who have had a similar experience would stand out as a warning against it.

"Now, the novice in fruit culture need not be misled if he will only seek advice from those competent to give it, and none offer a better article in this line than the very men who have cultivated the greatest number of sorts. After a man has become bewildered over the immense number of varieties of fruits frequently exhibited by such pomologists as Ellwanger & Barry, the Hon. Marshall P. Wilder, Hovey & Co., Moody & Son, and others noted for their extensive collections, let him attend one session of the American Pomological Society, and he will learn that these very men are careful to warn him to let about nine out of ten of all the sorts they have exhibited severely alone. In other words, as scientific pomologists, they place themselves 'straight on the record;' but in business they are compelled to pamper to the foolish whims of their customers."

BARKING TREES BY RABBITS.

A correspondent of the Weekly Granger says:—"I have a recipe to prevent the foraging of rabbits on young fruit trees. I have practiced it for eighteen years, and I know it to be a specific. I intended to have given it to the public every winter since I proved it by experiment, but somehow I have hitherto failed. I was recently reminded of it by reading a lengthy, troublesome and expensive remedy. Mine is simple and easy. First, catch a rabbit and kill it. I'll guarantee that it will quit its depredations, but its influence is not done yet. Cut it open and take out the bowels, lungs, liver, etc., and rub them on the young trees as high as a rabbit can reach; when you get through with that, cut a piece of the flesh, a quarter for instance, and rub till you get through. One rabbit is sufficient for five hundred trees, and it will last all through the winter. I have rubbed them so in November, and a rabbit will not touch it all through the winter, provided you had no tar or grease previously on them."

Farm Economy.

RECRUITING A RUN-DOWN FARM.

Ansel W. Putnam in New England Farmer gives the following history of a successful attempt to reclaim a worn-out farm:

Twenty-five years ago I was living in the town of Lexington, Mass., and making milk for Boston market. Near me was a large run-down farm. It was afterwards bought by an acquaintance, a Boston man, who had made money by manufacturing chemicals. He bought the farm for the purpose of making milk. He filled his barns full of milk machines, such as are for sale at Brighton, and then bought raw material for the machines to make milk from; he used the refuse to grow more material. About five years ago a mutual acquaintance told me the results as they were given to him by the owner. At that time the farm, stock and tools had cost him $20,000; he sold the previous year $7,500 worth of milk; his expenses were $5,500, leaving $2,000 profit, or ten per cent. interest upon his investment.

I was well acquainted with the farm twenty-five years ago, having bought standing grass sold at auction when the farm was in the care of an administrator. I think its estimated capacity at that time was seven cows, a yoke of oxen and one horse. Four years ago, at the time of the Concord cattle show, I spent a few days in Lexington, and visited the farm. The owner was not there, but I had a good opportunity to see the wonderful changes that had been made—large barns full of first and second crop hay—enough to winter between seventy-five and one-hundred head of stock. I saw a herd of fifty milch cows whose task it was to make fifty cans of milk daily, in as good fall feed as I ever saw, gathering the best of material from which to make it. The men were at work plowing, manuring and re-seeding an old pasture.

Mr. Putnam also tells his own experience on a 20 acre farm bought in the spring of 1874 and badly run.

My agricultural creed is this:—I believe growth and decay of vegetable matter to be nature's method of fertilization; I believe the manure from a ton of hay used in making milk, without any assistance from the grain dealer or druggist, will, if carefully saved and properly applied to the land on which the hay was raised, grow another ton of hay annually and constantly as long as land lasts and grass grows. I believe the manure from two tons of hay or grain not grown upon a farm, but bought and fed on the farm, will, at the end of six years from the time the manure is applied, increase the productive capacity of the farm one ton of hay annually, and by proper care that productiveness can be made to maintain itself to the end of time. I say six years, because it is six years or more before the crops get all there is of good barn manure. I believe the greener the manure the longer it lasts, and the better it is for grass growing. It takes two tons of hay grown off from the farm to equal one grown on it, because, as far as fertilization is concerned, the roots and stubble are about equal to the tops. Having faith in this creed and in my ability to save and apply the manure, I was confident that if for two years I fed upon the farm, in hay and grain, each year, as much more as the farm produced, at the end of six years the productive capacity of the farm would be doubled by those two years of extra feeding; therefore I determined to use the credit of the farm, and feed double. I went to the miller and asked him if he wished to sell me meal on a credit of forty-five days, thereby giving me a chance to make the milk pay for the meal from which it was partly made; he said yes. A stock dealer came to me and said he would like to sell me milch cows. I said, if I buy, it will not be convenient for me to pay for them until I sell some that I am fatting. He replied, "if you buy cows from me, you can pay for them when it is convenient for you to do so." A man came to me and said, "if you want to buy hay, I should like to supply you." I said, if I buy hay, I can't promise to pay for it until I get the money for the milk I make from the grass I grow with the manure I make from your hay. He said, "all right." I engaged ten or twelve tons, and paid him before he cut his next crop of hay.

From the first of April, 1874, to the first of April, 1875, I produced forty thousand quarts of milk. I bought both hay and grain, but I think this twenty acre farm can be made to produce forty thousand quarts of milk annually, feed the horses that do the work and not buy either hay, grain or manure. I am confident that if I continue to make that amount of milk, save and apply the manure, as I am now doing, that in five or six years, or as soon as I begin to get the full benefit of the extra manure I have already made, the farm will give me all I need to make my allowance of milk. That is the point I am working for, the top of the hill I am climbing. I am satisfied that, as I am situated, I can make manure for less than one-half of what I can buy stable manure for.

The Swine-Yard.

PORK AS AN ARTICLE OF FOOD.

If we examine the case from an impartial and unbiased standpoint, and divest all that has been said against pork and porkers from everything that is imaginary or not true, and take the fanaticism, the idiosyncracies and the ignorance of those lecturers and writers, for simply that which they deserve, we shall find, first, that pork is not a contemptible, useless, unwholesome and unsubstantial article of food; and a man who has to do a hard day's work, and has to eat his bread in the sweat of his face, does by no means despise it, but prefers it very often to the choicest beef or mutton. This is but natural, for pork furnishes more almost than anything else, not only of the elements required to support the respiratory process, but also those which are principally needed by the organism of a laboring man to repair the continual organic waste of material, as modified and increased by hard labor. It is true, pork can be too fat, or be too badly served or prepared by the cook to be tasty, even to the palate of a laboring man; but so can beef and mutton, and everything else, as can be found out very easily in certain boarding houses. Neither is pork so very unsubstantial an article of food as some of those writers and lecturers are anxious to make us believe. While the body of almost every other domesticated mammal contains between sixty-six and seventy-five per cent. of water, the body of a fat pig contained, according to analysis made in the Royal Agricultural College at Eldena, in Prussia, only 45.3 per cent., and the remainder, the water-free substance, contained 20.1 per cent. of protein substances, 77.1 per cent. of fat and 3 per cent. of mineral substances. It is true that pork is not so rich in nitrogen as beef for instance, but it is not nitrogen alone that is required in the food.

Pork, of course, is not always of the same quality. Its firmness or softness, and oiliness, respectively, depend, first, upon the breed of the animal, and secondly, upon the kind of food with which the same have been fattened. As a general rule, the small breeds of hogs, but especially the small Chinese and East Indian pigs, and the pigs of Naples and their descendants, have a much softer pork than the larger breeds of England and of Central Europe and their descendants. The so-called improved breeds produce a firm pork, containing a good deal of muscle. The food also causes considerable difference in the quality of the pork. Barley produces the firmest and most solid pork, and oats produce the softest—even softer and more oily than that produced by feeding corn. The fat of hogs fattened with barley becomes fluid at 105.8 deg. F., and the fat of hogs fattened with oats, at 100.4 deg. F. The former, when fluid, stiffens in one hour at a temperature of 89.6 deg. F., and the latter in six hours at a temperature of 75.2 deg. F. Consequently, one who prefers very solid pork must choose a pig of a large breed and must fatten it with barley, and one who desires his pork soft may select a small breed and fatten the same with corn or with oats.

It may be well to remark here that the feeding of much salt (chloride of sodium) is injurious to pigs, and interferes with their growth and with the process of fattening. Investigating further, we shall find, secondly, that pigs are much better than their reputation, and have done, and are doing, much more for mankind than mankind has done or is doing for them. First, there is no domesticated animal that is, as a general rule, so much neglected by its owner, and left to its resources, before it is fattened for the shambles, as a pig, and still there is no other animal that converts its food so soon into food for human beings. Secondly, a pig is an omnivorous animal; that is, can live and thrive on both animal and vegetable substances; is not very particular, and consumes with some relish almost any offal from the table, from the dairy and from the kitchen and garden, which can scarcely be utilized in any other way, with which it eats the grain of the field, the grass and clover of the pasture and the acorns of the forest. Therefore, almost any family can raise and fatten one or two pigs with scarcely any expense whatever. Thirdly, pigs are accused of being dirty and filthy, and fond of wallowing in the mud. This is a calumny, for scarcely any of our domestic animals keeps its stall and its bedding as clean as a pig, provided the latter is not compelled by the carelessness or by the ignorance of its owner to sleep and to deposit its excrements at the same place, but is provided with a good, dry, warm, well-littered and well-ventilated pen to sleep in, and with a yard which it can walk into at its own pleasure. Further, there is no animal that is more fond of being brushed, rubbed, washed and petted, or that enjoys a good bath in clean, fresh and cool water as much as does a pig, especially in the summer, when a daily bath is so essential to the health of the animal. A pig takes a bath in a mud pond only when no other opportunity is left.—*Chicago Tribune.*

Scientific and Useful.

CORNELL UNIVERSITY MACHINE SHOP.

Ed. Rural New-Yorker:—I am aware that an Agricultural Journal does not appear at first sight to be just the place in which to set forth the merits of a Machine Shop; but as quite one-half of our recruits are made up of farmers' sons, and a large percentage of our best mechanics have received their first and many times their best lessons in handicraft while helping to build and repair the farm buildings and implements, I believe a simple explanation of what we are trying to do to advance the standing and standard of the mechanics of the country will find many an interested reader among the farmers' sons and village subscribers of the Rural.

While there may be some question whether the Agricultural Colleges have proved a success or not, there can be no question about their not meeting the expectations of their advocates; and so far have they fallen short of it that many earnest educators have questioned if it were possible to do any better in attempting to teach practical mechanics than it has been in teaching practical agriculture. The general belief was, and still is, with a large majority, that the best method is to teach science or theories in colleges, and the practice in the best establishments of engineering or machine shops. There are some difficulties in carrying out this scheme, and also some objections to it when carried out. The simple operations performed in a machine shop are the measuring of distances, making surfaces flat, edges straight and corners square or at other fixed angles, and the making of holes and cylinders round and in the main parallel or conical, and a joining of parts by a combination of the

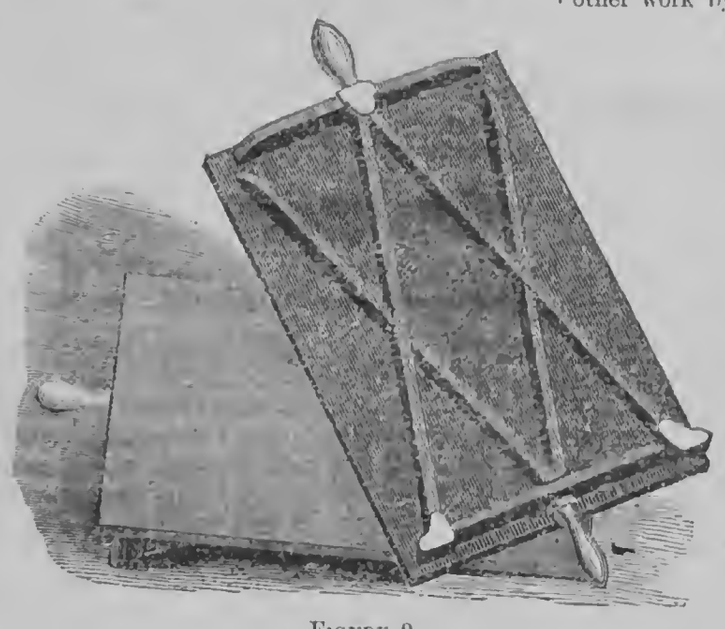

Figure 2

other operations. You can count upon your fingers all the establishments in the country that make a pretense of perfection in any of these operations, then divide that number by two and you will still outnumber those that approach all of them.

In starting this Machine Shop, three years ago, which had been endowed by the Hon. Hiram Sibley, President White strongly opposed the adding of another to the thousand ordinary machine shops already in the country. To avoid this, and to make the shop what I thought it ought to be, viz.,—a place which should have a similar relation to the ordinary shop that the University does to the common school, we have endeavored to give the students experience in the performance of these fundamental operations—using what we suppose to be the best methods and carrying them to as high state of perfection as known at the present time, and in applying them to a limited extent in the construction of original machinery rather than in duplicating ordinary machine tools which can be done more cheaply elsewhere. By the adoption of this plan we have gained in many ways. We have the good will of the best engineering establishments in the country, and they have helped us by donations of photographs of specimens of their manufacture, and in many other respects, while our students become familiar with the ways and machinery of the different makers, and our friendly relations gain for them a passport and often employment in these establishments; whereas a man taught in one of these workshops is liable to be one-sided in his thoughts and looked upon with suspicion if he wishes to gain admission into another.

This statement that there are so few places where they know what straight, flat and round implies, may seem a bold one; but it is the execution of these simple operations that in the main constitutes the difference between the best and the common work, and a knowledge of how the work is accomplished, to any mechanic, even if he has no occasion to use it—and if he knows how, he is much more likely to find a demand for its use than if he does not.

The accompanying figures show some of the tools we have made for our own use and a number of which have been sold to other shops. Fig. 1, a Straight Edge, is made in the form shown, that it may be light and so strong as not to spring by its own weight—for a piece of cast-iron will spring by its own weight the same (and about as much) as a piece of wood. They are planed as true as possible on an iron planer, and afterward scraped with a steel scraper until either two of three will fit together. It is necessary to make

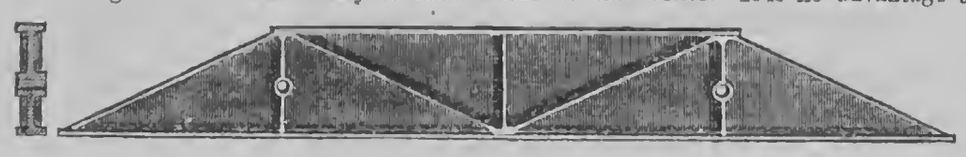

Figure 1.

three, because two might be fitted together perfectly and yet not be straight, one being concave and the other convex; but when either two of three fit in all positions they must all be straight. So perfect do the students make these that when two are placed together before a light not a ray passed between them, while a human hair placed between makes an apparently large opening, and the upper straight edge will swing around upon the hair as easily as a "whirligig" swings upon its post.

The Surface Plates (Fig. 2) are made by the same process, also three are essential to prove their accuracy. So perfect are they made that one glides upon another as freely as ice glides upon ice. The explanation of this is that a film of air remains between the two plates; the upper one floats upon that film of air. If the air is forced out from between the plates, one will lift the other up with it and hold it for a considerable length of time.

The Squares and Angle Plates, shown in the other figures (3 and 4) are made equally perfect. All these tools are used to test the accuracy of other work by covering their faces with a thin film of red paint and rubbing them on the work being tested.

The Measuring Machine, shown in the last figure (5) measures from 0 to 12 inches by the 1-10000 of an inch, and will be readily understood. The screw has a thread 16 to the inch, and the wheel is graduated into 625 parts. It is plain that by turning this wheel one of the divisions that the measuring points must be brought the 1-10000 of an inch nearer together. To give an idea how small a distance the 1-10000 of an inch is, it is only necessary to consider that a hair is from 15 to 30 times that amount. The machine is used principally for making standard gauges, one of which is shown in the machine. It is simply a tool, the lower part ground to a given standard size to gauge or caliper the size of a hole, and the open end ground out to the same size to measure or caliper shafts and any other work. They are made in sizes varying by 1-16th of an inch, from ¼ to 6 inches. With these tools time is saved, a uniform standard of measurements is secured, and the work of one shop will interchange with the work of another.

Ithaca, N. Y., Dec., 1875. John E. Sweet.

AERATING SOILS BY DRAINAGE.

It has always been our practice in making underdrains, especially in heavy soil, to have vent holes at the crossings of permanent fences between fields through which surface water could run more freely into the drain. This however is by no means necessary, and we are not sure that it is advisable. Great care has to be taken in placing stones carefully in these vent-holes and filling up with them to the surface so as to catch and hold straws, weeds and dirt, which might otherwise be washed into and obstruct the drain. Besides, we have always found it hard to tell what is a permanent and what is a temporary fence. As rails and fencing material become scarce, fields are enlarged, division fences pulled down and the land all plowed together. Probably in time most farming land suitable for tillage in the Eastern States will be unfenced. The tendency that way is very decided now, and as a well-laid under drain is something for all time, it is well to provide against all contingencies. So we would not advise filling a drain up with stone to the surface under a fence—not even a roadside or line fence. It is no advantage to the drain any way, and may some time become very inconvenient.

In extremely cold weather there is always a warm current of air rising from these drain chimneys. Heavy banks of snow drifting into the fence will be thawed away over the stone heap through which the warm air rises and the deeper the drain the more continued the current of air rising as warmed by the internal heat of the earth. At other times of the year than winter the action is reversed. As water is drawn off through the drain pipes when the land is flooded in spring and fall, its place is naturally filled by the warmer surface atmosphere. This air gradually cools as it sinks, but it cools only as it imparts its warmth to the earth with which it comes in contact, but never becoming colder than the air. In a thoroughly drained soil the warm summer rains carry down an appreciable amount of heat, but this is slight as compared with the warmth imparted to the soil by heated air. In undrained soils, on the contrary, the tendency is reversed, and the land loses instead of gaining heat. Water evaporating slowly from the surface takes not only its own heat but steals heat from the soil which it touches, making it cold, sour and unproductive. Every farmer knows the difference in quality of the herbage on a drained and undrained soil. Coarse, poor and thin grass will become sweet and nutritious by drainage. We think this effect goes farther than is generally supposed, as any one may believe by seeing how closely grass will be cropped over an underdrain, while a few rods distant on land not reached by the drain but not called wet, the grass will be left untsted. Part of this result is doubtless due to the fertilizing effect of aeration of the soil. The surface atmosphere following the water down to and into the drain parts with most of its fertilizing properties to the earth with which it comes in contact. Hence a good underdrain not only makes available the fertility in the soil, but actually increases the amount. Every drop of water percolating through the soil either from rain or snow, parts with its ammonia on its downward passage, and the air which follows contributes an additional quota. Land that is well drained is constantly being manured—the force of nature operates in behalf of the good farmer who drains his fields. As the undrained soil is constantly losing fertility by exaporation, so the drained is gaining by absorption. It is thought to be a shrewd move if one is able to get without stealing something from your neighbor. The farmer who drains his land and keeps the surface open and dry, is constantly absorbing fertility which his less sensible neighbor allows to go to waste.

The increased warmth of soil secured by underdraining is specially important for gardens, and also for fruits which, like the grape, require the greatest amount of heat to secure their maturity. It is now generally conceded that to dig a deep hole and fill it with rich earth, is the very worst preparation for planting a grape vine. Why? Only because this deep hole is a reservoir for water which, by slow evaporation, chills the earth with which the roots come in contact, while the rich, deep soil tempts grape roots to strike deeper than the heat of our short Northern summers can reach. Some of our most experienced vineyardists now advise shallow planting and keeping the rich soil near the surface, to discourage the roots from striking into the subsoil. The better plan is on all soils not naturally dry to drain thoroughly and leave the roots to go where they choose. We are satisfied that thorough drainage will hasten the ripening of grapes a week or ten days on all heavy soils and insure the ripening of Catawbas and Isabellas when they otherwise prove a failure. The best vineyards are planted on "drift" soil composed of fine particles of earth and rock porous enough to allow free drainage to a great depth. It is only necessary to bring heavy soils artificially to the condition which these hold naturally, to make them equally adapted to vineyard culture.

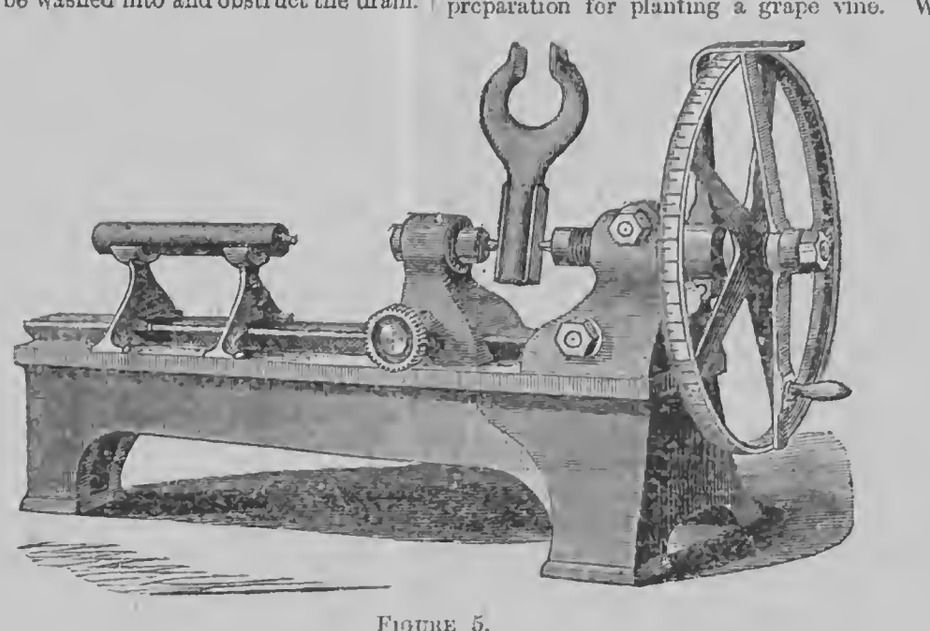

Figure 5.

Industrial Topics.

FARM LETTING IN ENGLAND.

Most of the large farms in England are worked by tenants, and the prices at which lands are let are a good indication of the improvement of farming and the condition of the farming interest. In one case the yearly rental

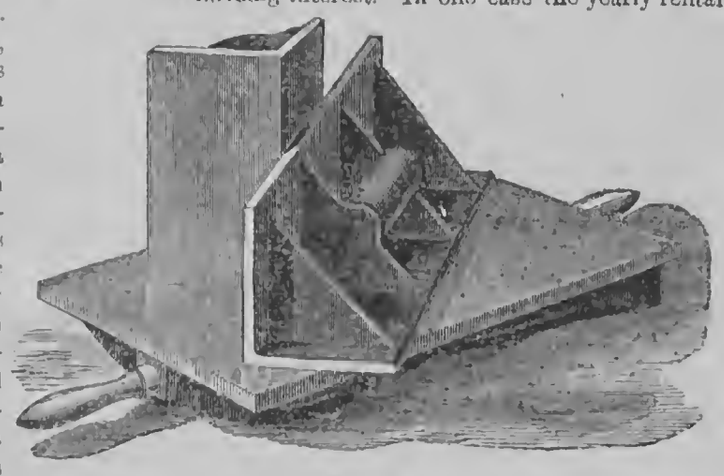

Figure 3.

of a farm of 850 acres was increased from £1,050 to £1,700, or about 70 per cent. The low rent was fixed in 1843, and the tenant spent over £18,000 in draining and improving the farm, on a 21 years' lease. Most of this large sum was of course spent in the earlier years of the lease, and it was reckoned that the improvements had more than paid for themselves, besides enormously increasing the value of the estate to the landlord. What do American farmers who own the land they till think of this? Will it not pay here to underdrain, manure and

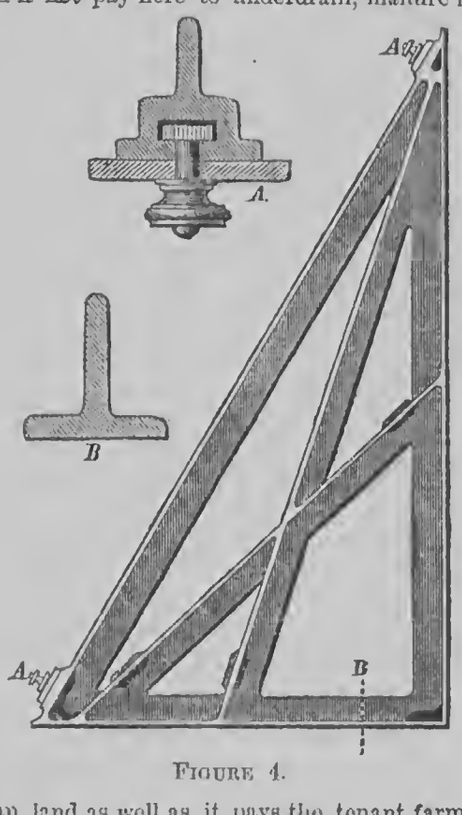

Figure 4.

clean land as well as it pays the tenant farmers of England? Very few improvements would be made here if the farmers were not also owners of the soil. In England a 21 years' lease is deemed sufficient margin for making almost as many improvements as on land held in fee. One of these large tenants who leased a large farm at low rates before an extraordinary rise in prices cleared £100,000 sterling, or half a million dollars, in twenty years. Still longer leases are made, and some of ninety-nine years are yearly falling due. It is also said that some leases for nine hundred and ninety-nine years, made in the time of Alfred the Great, have nearly expired, and the heirs to the property are carefully tracing their genealogies back to claim possession when the lease has closed.

England sends more flour to the West Indies and South America than we, though England is an importer while we are an exporter of wheat. England's policy of free trade encourages the West Indies to export to that country, and of course they buy what they need in return. Fair exchange is no robbery.

Diary of a Ruralist.

DAILY RURAL LIFE.

From the Diary of a Gentleman near New York City.

DRIED GRASSES FOR HOUSE ORNAMENTS.

Dec. 15.—The many species of Everlastings, or as the French term them, "Immortelles," serve an admirable purpose for household decorations among those who have not the conveniences for cultivating winter-blooming plants. They look rather stiff and formal, it is true, still it is better to have the niche filled with such than that it should remain unoccupied.

The addition of the plumes of some of the lately-introduced ornamental grasses has afforded an opportunity of making the winter bouquet really better than formerly. Of course the ordinary dried grasses imported by dealers in such articles are colored to suit the fancy of purchasers; but the greater part of this dyed stock is rather overdone in the way of brilliant hues, and we would fain find such peculiar shades of green in nature. But it was not of this well-known commercial stock that I wished to speak, but of the growing demand for the larger-plumed species, such as the Pampas Grass, *Erianthus Ravennæ*, and last, although not least, the common *Phragmites communis* of our salt water marshes. The latter, though seldom seen in cultivation, is a really superb species, the stems growing eight to ten feet high, crowned in autumn with a large, grayish, spreading plume, reminding one more of a bunch of ostrich feathers than of a spike of grass.

The *Erianthus* is of a similar color, but the plumes are one and a half to two feet long and four to five in diameter, forming a long, cylindrical, tapering spike. Those of the Pampas Grass are in size and form like the last, but of a clear, silvery, white color, fairly glistening in the sun or in a brilliantly-lighted room. The *Erianthus* and *Phragmites* are quite hardy in our Northern States, or at most require only slight protection: but the Pampas Grass is not at home in our cool climate: the roots, however, may be preserved in the cellar over winter, or by a very liberal covering when left in the open ground. But our seasons are not quite long enough at the North to insure full development of the flower spikes unless the plants are started under glass in spring, and then planted out as the weather gets warm. Further south this species succeeds remarkably well, giving plumes of great size and brilliancy. It also succeeds in California, and I have seen some plumes produced there which for size and purity of color far exceed anything of the kind ever produced in our climate here.

Now, the suggestion which I wish to make is this:—Why do not some of our Southern gardeners make a specialty of cultivating these ornamental grasses for supplying the constantly-increasing demand for such articles in all of our Northern cities? The dealers in New York City tell me that they cannot obtain a supply of the plumes of these ornamental grasses without importing from abroad, which necessarily enhances the prices considerably above what they might be produced for at home. Of course there are a large number of desirable species of ornamental grasses which one would desire to cultivate in making a specialty of such articles; but there is a good opportunity for some one to engage extensively in the three named. The South is the spot to begin in this kind of grass culture, and the bottom lands along the rivers would probably be preferable to the high and dry.

Speaking of the culture of ornamental grasses at the South reminds me of the fact that

SOUTHERN-GROWN TUBEROSES

are likely to drive others from the market. It is well known to florists that to bring tuberose bulbs to perfection a long and rather hot season is required. In the more Northern States the summer is scarcely long enough to mature the small offsets planted for the purpose of producing blooming bulbs; and even in localities where they do come near enough to enable the propagator to keep them over without decay, it requires two or three seasons to produce a large, blooming bulb from the small offsets with which we usually commence as a starting point. Then again, the bulbs grown in a cool climate are seldom as firm and solid or bloom as freely as those from a warm one; hence the oft-repeated announcement in florists' catalogues of "Genuine Imported Italian Tuberoses." Tuberoses of excellent quality are, however, produced in New Jersey and throughout the Middle States; but even in those States it generally requires two years to produce blooming bulbs, which, of course, necessitates a great deal of labor in handling and room for storing in winter. But in the climate of South Carolina and adjacent regions it is said that large, mature, blooming bulbs are readily produced from the small offsets in one season, and judging from specimens that I have seen which were grown in Georgia, the South has a good prospect of "carrying the market" in the line of tuberoses. They can certainly be produced much cheaper than in the North, and the quality of the bulbs would probably be of superior quality. I do not believe that the Southern people fully realize the advantage they possess in the way of climate, at least for producing many articles which would find a ready market in the Northern States and Europe.

SUGAR BEETS FOR MILCH COWS.

Dec. 16.—I have been experimenting in feeding sugar beets to a favorite milch cow. Before the end of the first week Jonx reported that he was obtaining less milk than before commencing to give the beets, and I advised giving a larger allowance. But all to no good, for at the end of three weeks the shrinkage amounted to at least 50 per cent. We then ceased feeding the beets and gave the cow an equal quantity of yellow-stone turnips. The flow of milk commenced to increase the second day, and now at the end of two weeks is fully up to the original standard when we commenced feeding beets.

I confess to be somewhat puzzled over this sugar beet experiment, for I thought they would prove to be superior to turnips as a milk-producer.

Perhaps some of the readers of the RURAL have had more experience in this beet business than myself and can throw a little light on the question. "Are beets good feed for milch cows?"

Pomological.

THE NORTHERN SPY AS A "KEEPING" APPLE.

THE Northern Spy apple has not obtained that popularity with New England fruit growers to which it is entitled. Many who have essayed to raise it have become disgusted because the trees came into bearing so late, and either cut them down or grafted them to other varieties. But the farmers who have had the patience to allow their trees to come into full bearing have been amply rewarded, and few persons who have once had a supply of the Northern Spy would willingly do without it. It is equally popular as an eating apple and for cooking, and not the least valuable among its many good points are its keeping qualities, in which it fairly rivals the Russet, which, it is popularly supposed, can be kept longer than any other apple. This year the writer of this was fortunate enough to eat, on Monday, July 19, the last apple of several barrels of Northern Spys put into the cellar of a gentleman of South Deerfield, the product of his orchard, and which have had only ordinary care. It would not be true to say that this specimen was as good as it would have been three or four months ago, but it was the best apple by all odds that we ever ate so late in the season. It was not preserved by withering and partly drying up, as is the case with Russets preserved till summer, but was fresh, crisp, juicy, aromatic—a real apple, and not an apology for one. With more Northern Spy trees in our orchards, and a little more attention paid to keeping them, it would be possible to have apples in New England the entire year round. In the cellar above alluded to there are still some Russets, but they have kept longer than the Spys only because they are not so palatable.—*Springfield (Mass.) Union.*

KEEPING APPLES.

A REPORT in the N. Y. Times says: "We have tried many ways for the safe keeping of apples, but we find none better than to put into clean barrels and head them up tightly, so as to exclude all the air and light possible, and store them in cool, dark, dry cellars. The nearer apples can be kept to the freezing point (32 deg. Fahrenheit), the longer and better they will keep. If the mercury in the cellar sinks a few degrees below this point apples well headed up in the barrels will not suffer, as wood is a non-conductor of heat, and the life of the apple aids in resisting cold just as the life of the tree resists the rigors of winter. As the apple is the fruit of this country, and is so conducive to health and comfort, it is worth while to put up a few barrels with special reference to next summer's use. For this purpose select the late-keeping varieties, such as Newtown Pippins Roxbury Russets, or even Northern Spys, and after the barrels are filled shake down among them some plaster (gypsum) till all the interstices are filled. This keeps out the air so effectually that they are virtually canned, and come out the next summer almost as fresh as when picked. We have known Roxbury Russets keep perfectly fresh for two years packed in this manner.

As you eat apples by the winter fireside decide which varieties are best, and prepare to graft wilding trees in the spring. Now is the time to cut grafts. Cover them with sand in the cellar till spring.

Around the Republic.

"DOWN SOUTH."

Diary and Notes of an Ex-Editor Seeking Health.

Jacksonville, Fla., Nov. 26.—The fog and dampness continue. Ex-Gov. REED asserts the irregularity of this sort of weather, but he talks hopefully for Florida. Notwithstanding the misrule, the vicious use made of Federal courts by the most reckless of politicians, and notwithstanding all that has been said and done to demoralize the colored population, he regards the future of Florida as likely to be brilliant and satisfactory. If only those whose interests are here would unite, regardless of partisan objects, to promote its material interests and use its resources for the common good of the whole people, there is no State in the Union which would yield surer compensation.

TALKING of the Eastern and Western counties of this State and of their comparative agricultural and horticultural merits, and of their respective attractions to Northern men, I find that Western Florida suffers in reputation from too much color. Those Western counties are represented as being excellent agricultural lands, but the colored population in some of them is equal to the whites numerically, and from that to four times as great. The system of ethics which has been taught these colored citizens by politicians renders it dangerous for white folks to have a cow, pig or fowl loose or astray. They are regarded contraband and unceremoniously confiscated by the colored brethren. This state of things has led to the settlement of the new lands of the Eastern counties, along the St. Johns and Indian rivers, where there is but little colored population. Here is where Northern people are locating, planting orange orchards and developing this land of fogs and flowers.

Nov. 29.—No sunshine yet. Mists and rain. Atmosphere so damp as to render clothing unwearable in the morning until it has been dried by the fire. Couldn't get my boots on this morning until I had dried them, although they had been in a closet out of a room in which there has been a fire daily. The clothes which cover the bed are damp and the air is chill until a pitch pine fire has dried them. Why write these facts? Because they are of importance to invalids and their advisers. This weather may be exceptional, but these exceptions deserve record that they may be taken into account. Had I supposed I should have to endure a fortnight of such discomfort as I have experienced since my arrival here I should have stopped in Northern Georgia and as inland as I could get.

Wednesday, Dec. 1st.—CRANDELL can abide this damp, depressing weather no longer, and, by the advice of a sensible physician here, has to-day sailed for New York. He ought never to have been advised to come hither. I see no reason to believe that this is the place for building up a depleted system. True, it is too soon for me to judge, but I should go to some other country to find "tonic in the air."

Col. CONCUSSION HARDEE said to-day, "I have lived here 30 years, and have seen no such continuous weather as this here at this season of the year."

Well, it is, perhaps, compensation to have made one's advent into this land, coincident with such atmospherical phenomena as the "oldest inhabitant" had never before seen.

Sunday, Dec. 5th.—I note a break in the clouds, and the first appearance of the sun. Imagine the delight of NOAH when the evidence that the flood was subsiding reached him! Imagine our delight that we are no longer to chew and swallow fog: for the wind is blowing from the South and West, and this, the weather-wise Floridian says, is significant of good weather.

Monday, Dec. 6.—We begin to find tonic in the air. The southwest breeze and the sunlight have dispelled the curtains of cloud and mist, and lifted out of a depressed physical and mental condition many an invalid here. It is only just to Florida to say that from what we hear of your experiences North during our cloudy and depressing weather, we ought to be content here. It is with no spirit of fault-finding that I have written what I have, but that your Northern readers may learn that the "Land of Flowers" is not constantly invested with a golden haze, relieved by royal, evergreen foliage, fragrant with ever-blooming flowers and vocal with the songs of birds—an Arcadia which yields unalloyed delights.

Judging by letters received from some of my Northern friends, such is their dream of Florida. Doubtless many come hither expecting to realize such a dream. If they do, they must be sorely disappointed. Nowhere is the law of compensation more rigidly administered. Much will be missed that was enjoyed at home, and something will be gained that was wanting there.

Let no young man come down here without money or a willingness to work at low wages, and work hard. I speak of healthy young men, some of whom have been here since my arrival and have returned whence they came. A company of four to six young mechanics came with us part of the way, bound inland to take up homesteads. With cash enough to live on until they can find work at paying wages, or until they can clear and improve lands and render them productive, there are certainly inducements for settlement here. But let no young man hope to get along here without cash or its equivalent, labor.

Let no young man, in poor health, come hither without money. If his coming is a last resort—if his case is hopeless at home, let him stay there and die there with his friends. If, however, he will come, let him not come alone—without some one to care for him. It is a "cold, cold world:" and while the people here are as sympathetic as anywhere, perhaps, yet no stranger's touch and tenderness are like those of home friends.

Too many come here too late. Every few days I hear of the death of those who would have lived as long, or longer, perhaps, had they staid at home. They come here to die among strangers, away from home friends, and to be carried home in coffins or to be buried here. True, it is not always easy to tell what is the wisest thing to do; but it is too frequently the case that too much is expected of the climate. This is a misfortune to those who cling to it as a last hope. Time is required to work changes that if successful must be radical: but the patient and his friends refuse the required large dose of "the tincture of time," or they have not the income necessary to secure it, and the work is only partially accomplished ere it is overthrown by their impatience or inability to wait. C. D. B.

The Poultry Yard.

WHICH BREED OF POULTRY EATS MOST.

My text will be found on page 348 of the RURAL NEW-YORKER for Nov. 27 in an article with the above heading, in which the writer, instead of answering the question he propounds, tells what "an Ohio poultry *dealer*" did. And then from the result of that gent's experiment, goes on to show that the Houdans are the most profitable fowls and the Leghorns next.

Now this experiment is of but little value, as we are not told at what time of the year it took place, or how long it continued, in fact all we are told is the amount fed and the amount of eggs laid, and the weight of each lot at the close. This trial is also unfair in selection of Brahmas and Cochins, as it is a notorious fact that the Dark Brahmas and Buff Cochins are the poorest layers of their respective kinds. Then again the Brahmas lay much larger eggs than either Houdans or Leghorns.

Besides this, his Brahma pullets were altogether too large and fat for the best results, seven pounds apiece for pullets! Heavy enough for fine cockerels. But the great injustice is in putting all the eggs at the same valuation, for it is well known that the Brahmas lay in the winter, and the others do not, and, with us at least, eggs bring two or three times as much in winter as they do in summer. Here, in the months of Dec., Jan., Feb. and March, eggs range from 25 to 50 cents, averaging, perhaps, 35 cents, while from April to Nov. they hardly average 12½ cents. Now as Leghorns and Houdans lay the bulk of their eggs between these two last named months, if you put their eggs at 15 cents per doz., it is all they will stand; on the other hand, the Brahma's eggs come in thick when "eggs are eggs," and will easily average 25 cents per doz. Saying nothing of the superior size of the Brahmas, we will see how the account stands:

Breed.	cost of feed.	val. of eggs.	val. of meat.	total value.	total profit.
Brahmas.	$9.20	$12.00	$14.00	$26.00	$17.40
Cochins.	10.15	12.33	14.16	26.49	16.34
Houdans.	4.35	9.50	9.10	18.64	14.29
Leghorns.	5.77	10.05	7.30	17.35	12 53

This gives the Brahmas fair play, and all will see how it stands.

But to answer the question at the head of this article. The breed which eats most is the most profitable, as a fowl is only a machine for turning grain into eggs, and the machine which changes the most makes the most profit. A correspondent of the Poultry World (I believe I. K. FELCH) gives the following: "One bushel of corn, or its equivalent in other food, will make nine pounds of live, or seven and one-tenth pounds of dressed poultry, or twelve and one-half pounds of eggs." My experience is in favor of this rule, that it makes no difference what breed you have, if you keep them properly you will get so much, in eggs or meat, for so much corn.

Liberal feeding means liberal profits; scanty feeding scanty profits, neglect means a loss of what you do feed them. As a rule, feed well or kill the flock. This should be the rule, for the results are as sure to follow, as day is to follow sunrise. In this country (North Wis.) the Light Brahma is the fowl, though the White Cochin is a favorite with many. A. M. VAN ARKEN.

Fort Howard, Wis.

Patrons of Husbandry.

MEETINGS OF STATE GRANGES.

DECEMBER is the month when most of the State Granges have their annual sessions, and their meetings rival in interest and importance those of the State Legislatures in January. This is particularly true of some of the Western States, where Granges number hundreds, if not thousands, and represent fully one-half of the adult population of the State. In our brief space, we can only make mention of these sessions with the more important facts developed.

Minnesota.—The State Grange met Dec. 14. About 300 delegates were present, and Master S. E. ADAMS presided. The number of Granges in the State is 546, with 18,000 members. It was voted to co-operate with the Minnesota Centennial Commission in seeing that the State is represented at the Philadelphia Exposition next summer. The new Executive Committee consists of E. R. Perkins, Minnetonka City; E. S. Dart, Owatonna; S. G. Canfield, Canfield; M. R. Sullivan, Rosemount.

Michigan.—State Grange met Dec. 14, Master J. J. WOODMAN presiding, with 200 delegates representing 611 Granges and 34,275 members. The Grange proposes to work some plaster beds and furnish to members at a slight advance over cost price, thus breaking up a monopoly which has been established in this important and necessary fertilizer. The following were elected as Executive Committee: Samuel Long, Kent; E. H. Jeffrey, Ingham; C. G. Luce, Branch.

Illinois.—State Grange met at Champaign, Dec. 14, Master GOLDEN presiding. The constitutional amendments were adopted. The following officers were elected: Master, A. Forsyth, of Isbel, Edgar County; Overseer, John Downen, of Industry, McDonough County; Lecturer, A. Golder, of Rock Falls, Whiteside County. Executive Committee, A. J. Aloxander, Gilman; R. N. Foster, Sterling; R. M. Guy, LeRoy; C. N. Anderson, Champaign.

Louisiana.—State Grange met Dec. 14. Fifty-nine delegates, representing 325 Granges and 17,000 members. The following officers were elected: Master, R. H. Ryland, of West Feliciana Parish; Overseer, E. T. Sellers; Lecturer, R. D. Bridger. Executive Committee: Thos. Rhinehart (holding over), E. H. Fay, long term; A. G. Carter, long term; Hardy Richardson, short term.

Indiana.—State Grange met in Indianapolis, Dec. 14, Master HENLEY JAMES presiding. During the past year the State Agency has handled over $300,000 worth of goods at an expense of 1½ per cent., and to the great advantage of Patrons or purchasers. The Grange Treasurer has now $25,000 surplus. The following officers were elected: Master, Henley James, of Marion; Overseer, Archibald Johnson, of Crawfordsville; Lecturer, B. F. Ham, of Pendleton; Chaplain, Mrs. Paulino Paddock, of Union Co. Executive Committee, Aaron Jones, St. Joseph Co.; W. D. Ward, Howard Co.; Nelson, Pegg, Randolph Co.; R. Mitchell, Gibson Co.; R. C. McWilliams, Parke Co.; A. B. Line, Franklin Co.

Pennsylvania.—State Grange met in Lancaster, Dec. 14, D. B. MANGER, presiding, and 800 delegates representing 630 Granges and 25,000 members. The State business Agent has saved members $20,000, at an expense of $2,700. Grounds have been procured for an Encampment for Patrons of Husbandry at the Centennial Exposition, and more than half the stock has been subscribed. Executive Committee: W. L. Archer, Washington Co.; W. W. Parker, Chester Co.; J. Beaty Henry, Mifflin Co.; Ezra Loomis, Bradford Co.

Iowa.—State Grange met Dec. 14, Master SMEDLEY presiding and delivering the annual address. Officers elected: Master, O. H. P. Buchanan, Henry Co.; Overseer, S. H. Bonham, Clark Co.; Lecturer, Julia A. Garretson, Henry Co.; Secretary, W. L. Carpenter, Blackhawk Co.

The Ohio Patrons have decided to make Lima, Allen Co., a distributing point, and have organized a Joint Stock Co., with $50,000 capital, for buildings and purchase of stores. Another Joint Stock Co. has been formed to establish a supply house in Cleveland, with the following incorporators: D. W. Westcott, Ashtabula; E. F. Ensign, Lake; D. R. Baldwin, Geauga; Joel Foot, Cuyahoga; W. Williamson, Portage; L. L. Sears, Lorain; Herbert Nettleton, Medina; O. P. Laird, Trumbull; M. D. Call Summit; R. P. Wolcott, Trumbull; W. W. Stevens, Ashtabula.

Delaware.—State Grange met at Milford, Dec. 14, JOHN J. ROSE presiding. The annual address will be printed in the Delaware Farmer, edited by Sister DILWORTH of Grange No. 9. The reports of Masters of Granges show the Order to be gaining ground in Delaware, notwithstanding much opposition. The next meeting of the State Grange is to be held at Newark, Del., the home of that good brother and earnest Patron, WM. DEAN.

New Jersey.—State Grange met at Camden, Dec. 14, Master WHITEHEAD presiding. The Secretary's report showed an increase of 840 in the last nine months, making the membership now 4,687. Fourteen Subordinate Granges have been organized in the counties, and there are 96 local organizations.

POSITION AND PROSPECTS OF THE P. OF H.

DESPITE numerous predictions of failure, the records show that the Patrons of Husbandry organization was never in so prosperous a condition as now. It certainly never exerted wider influence, and there are no signs that its success is to decrease. The producing classes of the country, and especially farmers and their wives, have been emancipated from the necessity for constant and laborious toil by the progress of practical agricultural science, and by the introduction of labor-saving machinery on the farm and in the household. For the first time in the one hundred years during which we have been an independent people, the farmers, planters, and farm laborers of the country have felt themselves prepared to enforce their ideas with regard to important public measures. The Grange, as the chief organized representative of the Farmer, will naturally take the lead in expressing his wishes; and it will do this not by favoring one or the other of the political parties, but by supporting measures and policies which appeal to the good sense of both. Education, temperance, economy in public affairs, the rebuke of extravagance and corruption, and the establishment of strict accountability of all officials to the People, are ideas in which the chief semi-official representative of the American People may naturally be supposed to feel a deep interest.

The Grange not only represents the largest body of men and women in the country, but is itself the most numerous and influential of American organizations, comprising about 27,000 separate Granges, while the Odd Fellows and Masons combined, number only 19,981 Lodges, or a little less than 20,000 in the world. In the number of its members the superiority of the Order of P. of H. is probably still greater than in its organizations. No doubt the older bodies possess more wealth, and it is probable that in this respect the superiority of Masons and Odd Fellows will always be manifest. The Grange is of modest and humble origin, which we trust its leading members will ever remember. Its glory lies in the fact that it represents the plain, working and producing classes of the country, and its strength is in the increasing necessity which the scattered rural population have felt for more intimate social relations and organizations for mutual instruction, interest and advantage.

The chief design of the Grange is to provide a means, and the only practical means yet discovered, for establishing live, interesting and social Farmers' Clubs in every town and neighborhood. That they have done this successfully where other appliances failed, demonstrates the advantage of giving these local clubs increased vitality and importance by combining them in State and National organizations. The subordinate Granges, controlled directly by the people in their respective neighborhoods, are the pivotal points on which Grange usefulness rests. State Granges subserve additional uses in arranging Agencies for sale and purchase of stock, implements and other articles, which subordinate Granges would not so well do. The frequent sessions of the National Grange are also important to devise plans for the good of the Order, and promoting its usefulness and prosperity. With this safe conservative limitations of its powers, continued growth of the Order will only mean the increase of social intercourse, refinement and intelligence among the rural population and need occasion no alarm, though the Order should speedily be made to include the entire producing interest of the country.

The farmers and planters of the United States have heretofore been too isolated for mutual improvement, or for the influence which so large a body of honest, industrious and increasingly intelligent men and women ought rightfully to exert. As the numerous advantages of the Grange system are made manifest, the prejudices, which have limited its progress will disappear. During the Centennial Year, on which we are now entering, there is every season to believe that its growth and importance will surpass anything it has heretofore attained.

GRANGE NOTES.

THEY have a Grange grist mill in successful operation at Camden, Ark.

WHITEBECK GRANGE, in Indiana, has purchased an acre and a half of land on which to build a Grange hall.

THE annual Convention of the N. H. State Grange, held at Manchester last week, was the largest ever held in that State. Nearly all of the 72 subordinate lodges were represented.

THE Maryland Patrons petition the Legislature to do away with the present system and substitute therefor private inspections of tobacco.

Domestic Economy.

A PLEA FOR PATCHWORK.

LONG years ago I became disgusted with the idea of spending so much time in making patchwork as had been done by some persons—myself, for instance—in times past. I thought it better to make comforts of new calico, without piecing, for winter, and have white spreads for outside, which would look better and cost less than the patchwork quilts upon which so much precious time had been wasted. I wish it to be understood that I had enough love of the beautiful to admire the many handsome quilt patterns, such as "Oak Leaf," "Flower Pot," "Peony," and others; but I thought that women could better employ their time in reading, or in making handsome rugs for the floor, or even the inevitable rag carpet. But a little change came over the spirit of my dreams, as I lay sick one day, when JULIA took up a patchwork quilt as it lay ready to be added to the cover, if necessary, and began looking over the pieces of worsted dresses which had been worn by ourselves and friends in days gone by.

"Here is a piece, mother, of Aunt HATTIE'S dress, and here is one of little MAY'S, which she wore only a few weeks before she died. And there, mother, is a piece of grandma's dress. How like her it looks! And here, mother, is a piece of one of yours, which you had as long ago as I can remember." And as she looked over the quilt, presenting piece after piece to my notice, and gave me so much pleasure, I thought, by all means, let the pieces be preserved which accumulate as we make dresses, and when one of the family takes the patchwork "fever" let it have its "run," and some day the patchwork quilt may bring as great comfort to other invalids as it has to me. But here is an idea. Few persons are liable to take such a fever when the utility of the work is so much questioned, and I see how difficult is this middle ground. I am almost ready to sanction the practice in vogue long ago, of training the little girls to patchwork, as we, of New England, were once trained just as effectually as we were drilled in the little old primer of the same locality. There is a great pleasure in calling to mind old friends and old associations and a real, *bona fide* "scrap-quilt" is certainly a good way of doing it; yea, even equal to old letters.

A. F.

GARMENTS MADE WATERPROOF.

A WRITER in an English paper says: By the way, speaking of waterproofs, I think I can give travelers a valuable hint or two. For many years I have worn India rubber waterproofs, but will buy no more, for I have learned that good Scottish tweed can be made entirely impervious to rain, and, moreover, I have learned to make it so; and, for the benefit of your readers, will give the recipe:

In a bucket of soft water put half a pound of sugar of lead and half a pound of powdered alum; stir this at intervals until it becomes clear; pour it off into another bucket and put the garment therein, and let it be in for twenty-four hours, and then hang it up to dry without wringing it. Two of my party—a lady and gentleman—have worn garments thus treated in the wildest storms of wind and rain without getting wet. The rain hangs upon the cloth in globules. In short, they are really waterproof. The gentleman, a fortnight ago, walked nine miles in a storm of rain and wind, such as you rarely see in the South; and, when he slipped off his overcoat, his underwear was as dry as when he put them on. This, I think, is a secret worth knowing, for cloth, if it can be made to keep out wet, is, in every way, better than what we know as most waterproofs.

HOW TO CARVE AND HELP AT TABLE.

IT is considered an accomplishment for a lady to know how to carve well at her own table. It is not proper to stand in carving. The carving knife should be sharp and thin.

To carve fowls (which should always be laid with the breast uppermost), place the fork in the breast, and take off the wings and legs without turning the fowl; then cut out the merry thought, cut slices from the breast, take out the collar bone, cut off the side pieces, and then cut the carcass in two. Divide the joints in the leg of a turkey.

In carving a sirloin, cut thin slices from the side next to you (it must be put on the dish with the tenderloin underneath) then turn it, and cut from the tenderloin. Help the guests to both kinds.

In carving a leg of mutton or ham, begin by cutting across the middle to the bone. Cut a tongue across and not lengthwise, and help from the middle part.

Carve a fore-quarter of lamb by separating the shoulder from the ribs, and then divide the ribs.

To carve a loin of veal, begin at the smaller end and separate the ribs. Help each one to a piece of kidney and its fat. Carve pork and mutton in the same way.

To carve a fillet of veal, begin at the top and help to the dressing with each slice. In a breast of veal, separate the breast and brisket and then cut them up, asking which part is preferred.

In carving a pig, it is customary to divide it and take off the head before it comes to the table, as, to many persons, the head is revolting. Cut off the limbs and divide the ribs.

In carving venison, make a deep incision down to the bone to let out the juices, and turn the broad end toward you, cutting deep in thin slices.

For a saddle of venison, cut from the tail toward the other end, on each side, in thin slices. Warm plates are very necessary with venison and mutton, and in winter are desirable for all meats.

HOME-MADE CREAM CANDY.

To a coffee-cupful of white sugar add two tablespoonfuls of water to dissolve it and boil, without stirring, in a bright tin pan until it will crisp in water like molasses candy. Just before it is done put in a teaspoonful of extract of vanilla, or lemon, or peppermint essence, and a quarter of a teaspoonful of cream tartar. When done, pour out into a buttered pan, and when cool enough to handle, work it as you would molasses candy until it is perfectly white, then stretch and lay on a marble slab or molding-board; with a chopping knife cut into mouthfuls and lay it on buttered paper on a plate. When children want candy, by all means let them have that made at home, and they will not eat plaster of paris, chalk, starch and poisonous compounds, which derange their stomach and ruin their teeth.

SELECTED RECIPES.

To Cook Turnips.—Wash quite clean, do not peel or cut or soak. Boil them whole in their "jackets." When, by trying them with a fork, they are found quite tender, take them up, peel them, press moderately, and mash with butter.

To Roast Birds.—Take larks, partridges, snipe or any other small birds; cover them with sage leaves, fresh if possible, then envelop them in slices of bacon, put them down to a good fire and baste with butter; sprinkle a little salt and serve in the gravy.

Cream Tapioca.—Soak two-thirds of a cup of tapioca in warm water till soft; boil a quart of milk with the yolks of three eggs, well beaten, and two-thirds of a cup of sugar. Boil till thick, stirring carefully; beat the whites of the eggs with two-thirds of a cup of white sugar, flavor and pour on top of the pudding. Set in the oven to brown.

To Clean Glass.—This mode of cleaning fine glass gives it a great brilliancy. Take fine powdered indigo, dip into it a moistened linen rag, smear over the glass with it, and then wipe it off with a perfectly dry cloth. As a substitute for this, fine sifted ashes, applied by a rag dipped in spirits, will answer just as well. Spanish white is apt to make the glass rough and injure it.

To Make Piccalilli.—To half a bushel nicely chopped tomatoes, which must be squeezed dry, add two dozen onions chopped fine, one dozen green peppers chopped, one box of ground mustard, one large root of grated horseradish, nearly a pint of salt, four tablespoonfuls ground cloves, four of allspice. Mix thoroughly in a stone jar and cover with vinegar, making a hole in the center to let the vinegar to the bottom.

Scotch Broth.—Take four pounds of mutton—part of the leg is best; add one gallon water, one teacupful of pearl barley, two carrots sliced, two turnips sliced, two onions cut small, three carrots grated, the white part of a large cabbage chopped very small, and a small quantity of parsley. Season with pepper and salt. Let this boil very gently for three hours and a half, and at the dinner table it will, most likely, by all who are fond of soups, be pronounced excellent.

To Clean Garments.—Wet a sponge in warm water, and squeeze it out till dry; then sponge one place after another until all the garment has been cleansed. All the dust and soil will be absorbed by the sponge. But if the garment is very much soiled, wash the sponge in clean water several times, squeezing it as dry as possible by wrapping it in a piece of black alpaca. This method of cleansing is more effectual than a hand-brush, and many spots will disappear by the use of pure water

Apple Bread.—Weigh one pound of fresh juicy apples; peel, core and stew them into a pulp, being careful to use a porcelain kettle or a stone jar, placed inside a kettle of boiling water; mix the pulp with two pounds of the best flour; put in the same quantity of yeast you would use for common bread, and as much water as will make it a fine, smooth dough; put it into a pan and place in a warm place to rise, and let it remain for twelve hours at least. Form it into rather long-shaped loaves, and bake in a quick oven.

"PROGRESS AND IMPROVEMENT."

MOORE'S RURAL NEW-YORKER.

A NATIONAL ILLUSTRATED

RURAL, LITERARY AND FAMILY NEWSPAPER.

D. D. T. MOORE,

Founder and Conducting Editor.

WM. J. FOWLER, ANDREW S. FULLER

SATURDAY, JANUARY 1, 1876.

THE CENTENNIAL YEAR'S RURAL.

THE RURAL NEW-YORKER this week enters upon its Twenty-Seventh Year under very favorable auspices—with better prospects than for many a twelve-month. We trust the new and neat dress in which it appears will please its thousands of readers all over the country. The clear and yet compact type and their accompaniments give assurance that the fine mechanical execution for which the RURAL has always been noted will be fully maintained, while we intend that its CONTENTS shall vie with, if not excel, its APPEARANCE. In these two great essentials of journalism we hope to render the performance much better than the promise, and think other improvements tending to increase the value and attractiveness of the paper will be introduced in due season. Indeed, we have resolved that the RURAL NEW-YORKER shall be worthy of the Centennial Year—to spare neither labor nor expense to render it the leader in Agricultural, Horticultural and Home "Progress and Improvement."

These utterances are made in no boasting or selfish spirit, but with an earnest desire and determination to EXCEL in efforts to advance the best interests of the Producing Classes, and especially of the one for whose prosperity we mainly labor—that of the Rural Population. And, in language used on a similar occasion, though the marked success of this journal may have created envy and jealousy in the breasts of some, we extend kindly greetings to all and bear malice toward none. As there is "ample room and verge enough" for all who desire to promote the good cause in which we are engaged, each and every honorable contemporary has our best wishes, and may the most deserving receive the most abundant reward.

Those familiar with the RURAL—and many herein addressed have taken it during the entire twenty-six years of its publication—need not be told of its character and objects. They know that it has ever manifested the true spirit of its inspiring Motto, "*Excelsior*," and laudable objects—among which the improvement of the Mind and the Soil has been paramount. To these old friends, therefore, we make no promises, feeling confident that they will take our past record and action as an assurance of future rectitude—that we shall continue to uphold the Right and condemn the Wrong under any and all circumstances, and do our best to interest, instruct and elevate the upper ten hundred thousand—the Producing Classes of the Continent.

To the thousands—we trust it may be tens of thousands—of comparative strangers whom we now address for the first time as regular subscribers, we can only say that the RURAL NEW-YORKER will, during the year upon which it now enters, endeavor to more than maintain its reputation as the Leading and Best Weekly of its Class in America. If it fails of this, it will not be for want of earnest and honest efforts, aided by long experience, the best talent in the land, and increased facilities for furnishing the Standard Authority on the various practical, scientific, and other useful subjects to which its pages are devoted. And now to what we mean—Business.

POSTAGE ON SEEDS AND PLANTS.

WHEN a Committee of our Seedsmen and Dealers in Plants called upon the Postmaster-General, a few days since, and asked that the old rates of postage be restored on seeds, cuttings and plants, they were gravely informed that the receipts of the Department were several millions of dollars less than its expenses, and under the circumstances it would be useless to ask Congress to make the change or in any manner reduce present rates. The why or wherefore of the enormous deficit in the postal receipts appears to have been passed over in silence, no explanation being made or attempted. But during the interview referred to the P. M. G. informed the Committee (at least it is so reported) that the Department had to pay six hundred and sixty dollars per ton for carrying mail matter from New York to San Francisco, Cal., or three times as much as is charged individuals for transporting first-class freight over the same routes. This remark furnishes the key to the deficit in receipts, less expenses; and just so long as contractors for carrying the mails can charge their own prices for service, just so long will the people be burdened with high rates of postage and inefficient means of transportation, ending in an annual appropriation of five to ten millions of dollars to make up a deficit.

If the Postal Department is not self-supporting, it is not because the rates of postage are low, or for any lack of matter passing through the mails, but on account of paying exorbitant prices for transportation. Economy must begin here; then all difficulties in regard to deficits would soon end. The lobbying to obtain mail contracts, and the anxiety which contractors exhibit whenever a new route is opened or an old one to be re-let, shows conclusively that money is made in carrying the mails.

The residents of every country, village and hamlet are interested in this subject of cheap postage rates on seeds, plants and cuttings, and we hope they will speak out in tones that cannot be mistaken, demanding that their wishes in this matter shall be duly considered. The attempt to exclude plants, seeds and similar useful articles from the mails is a direct insult to our farmers, horticulturists and gardeners, and we hope they will have independent manliness enough to resent it in a fitting manner, even to demanding that every traitor to their interests now in Congress shall stay at home hereafter. We call upon them to watch the votes taken in Congress upon this subject, and to *spot* every man who lends himself to express companies and other monopolies.

NORTHWESTERN DAIRYMEN'S ASSOCIATION.

THE annual meeting of this Association will be held at Fort Atkinson, Wis., Feb. 8th, 9th and 10th. The following programme of proceedings has been issued:

Tuesday, 3 P. M.—Organization of Convention, committee appointments, &c.

7 P. M.—Address of welcome, by H. B. Willard, Esq., Fort Atkinson, Wis. Response by Dr. R. R. Stone, Elgin, Ill. Annual address by President Faville.

Condition and Prospects of Dairying in the Northwest—J. R. McLean, President Illinois Dairymen's Association, Elgin, Ill.; Hon. Hiram Smith, President Wisconsin Dairymen's Association, Sheboygan Falls, Wis.

Wednesday, A. M.—Do the Laws of the Northwest Furnish Adequate Protection Against the Adulteration of Milk?—W. H. Stewart, Hebron, Ill.

How far should Dairymen Combine Other Branches of Agriculture with this Specialty?—H. C. Drake, Lake Mills, Wis.; Robert Stewart, Hebron, Ill.

The Best Method of Keeping up the Supply of Milk Through the Summer Drought—John Porter, Mazomanie, Wis.; W. C. White, Kenosha, Wis.

P. M.—Butter Making—from Milking to Selling—J. J. Goodwin, Beloit, Wis.; I. Boles, Marengo, Ill.

Cheese Making—from Milking to Selling—D. E. Wood, Huntley, Ill.; S. Littlefield, Plymouth, Wis.

7 P. M.—Public address.

Thursday, A. M.—Is it Best for the Dairy Interest to Manufacture Butter and Cheese from the Same Milk?—L. H. Wanzer, Elgin, Ill.; B. R. Hinckley, Oconomowoc, Wis.

Where, When and How to Sell Dairy Products; What Markets to Look to; Prompt Sales or Holding; Selling at Home at Boards of Trade or Forwarding on Commission—D. R. Stone, Elgin, Ill.; C. H. Wilder, Evansville, Wis.

Afternoon—Election of officers.

Annual Report of Secretary—G. E. Morrow, Chicago, Ill.

Essay by Mrs. Frances C. Jones, Fort Atkinson, Wis.

General discussion upon the proper management of the dairy and dairy farm.

Evening—Dairy sociable, with banquet, speeches, toasts, music, &c.

RURAL NOTES AND QUERIES.

Our New Dress—More Reading Matter.—The RURAL's new type for the practical departments is smaller, or more compact, than that formerly used, enabling us to give a much larger amount of reading matter in the same space, and yet is large and clear enough for everybody to read easily. This type makes more work for editors and printers, and consequently greater expense, but we think readers will not object, and so long as they are satisfied, we ought not to complain. The fact is, to change the subject, we—all hands—have been so hurried in getting out this number of the RURAL, that some things are a little mixed, and we havn't done as well as we expected: but as we are to issue fifty-two more numbers this year, we will fall back on good old RIP VAN WINKLE'S saying, "We won't count, this time."

An Excellent Suggestion.—The New York Centennial Commissioners propose that some qualified person in each County of the State should be selected to write the local history of the same for the last one hundred years, and that the whole be published by the State board in good form for preservation and circulation. Such a work, carefully prepared, would have an extensive sale, not only among residents of New York but natives of this State scattered over the West and South. Half the money spent in local celebrations and fire-works would more than suffice to prepare such a volume, and once issued it could not fail to repay all expenses. Such a history would in many Counties reach back to the earliest settlement. It would preserve for posterity the names of early notabilities, and would become more interesting and more valuable with increasing time. The published histories of the country necessarily give little insight into merely local matters, while some of these will be of greatest interest to people who live one hundred years hence. It is to be hoped that this idea will be practically acted upon in every county in the State, and it is adapted to other latitudes quite as well as to New York. The nearest approach to this idea is a book entitled, "The Annals of Kansas," recently published. Almost all the States have local histories, which, though not quite so exciting as those of Kansas, will be read with little less interest.

Doing a small and Safe Business.—There is some sense in the following paragraph from the Boston News. The unhealthy expansion of business beyond the means of parties conducting it has been rather encouraged by banks which distrusted business men of humbler pretensions:

"For some years it has been an unsolved problem whether a small dealer could live in competition with the great houses which threatened to absorb everything. Banks and importers have helped this on. The former have usually done the bidding of these great merchants without a question. Paper presented by them, or with their names upon it, has been the first to be received, even though humble tradesmen have thereby been compelled to forego their small requests. In a stringent market the small traders could get little accommodation, and having a small account have not been much regarded. Now that the day of trial is upon us, it is being discovered that the humble tradesmen are quite as strong to bear it as their mighty neighbors, having fewer liabilities in proportion to capital in trade. Banks are likely to find occasion for a re-adjustment of bank nomenclature in describing the relative strength of parties. We venture the opinion that a million dollars of discounts in small notes of so-called weak parties, engaged in a legitimate business, will show a smaller percentage of losses than the same amount invested in the paper of commercial giants. And of this commercial trial must come a re-adjustment of business relations, which will offer some chance for tradesmen of moderate means and ambition, who will not scatter debts over a continent and credits in both hemispheres."

Don't Allow Smoking.—We mean around barns and farm buildings. Most people who smoke will agree with us that it would be better if the practice could be abandoned entirely; but every farmer can at least make a rule that no smoking should be allowed in, or near buildings, straw and hay stacks and barn yards. It will need a good deal of vigilance to enforce such a regulation, but it is absolutely necessary if property is to be reasonably safe from the destructive element. More than half the fires in rural districts originate in careless use of tobacco, often by hired men or tramps roaming about the country and seeking a night's lodging. Occasionally the burning building makes the funeral pyre of its originator—a result which does not seem so horrible to the man whose buildings are burned, as it naturally should.

The Queen's Fat Stock.—The annual Christmas sale of fat stock belonging to Queen VICTORIA and fed upon the royal demesne, was held at the Prince Consort's Shaw Farm, Windsor Park, the other day. There was a large attendance of buyers. The sale consisted of forty-two very fine Short-Horn and polled Scotch oxen and heifers, which realized from £30 to £53; 400 fine wether sheep, the South Downs fetching from £3 11s. to £5 4s., the Cheviots £2 19s. to £3 7s., and lambs £2 19s. to £5 2s. 6d.; and 50 bacon hogs and porkers, the white Prince Consort's breed bringing £14 5s. to £15, and the bacon hogs £5 to £15 5s.

Thanks to Press and People—For their kind expressions and generous acts in behalf of the RURAL, of which we daily receive manifestations. Our contemporaries, near and distant, have always appreciated this journal, but their recent notices indicate continued faith in its tenets and management—for which we, as in duty bound, tender grateful acknowledgment. And to the People, especially our Agent-Friends, we are greatly indebted for their successful exercise of influence in support of the Old RURAL. The manner or style of their clubbing is most effective, and if they will keep on we think our circulation will be greatly augmented during the early weeks of the Centennial Year—the year which is, as many believe, to restore prosperity to the Republic and place it on a sure and enduring foundation.

Write for Your Paper!—Among the good resolutions, common at this date, we trust RURAL readers will include this one—to write for their papers. We propose to do the best possible towards instructing RURAL readers on practical and farm topics, but the old saying is a true one that nobody is as wise as everybody. Therefore if you know some fact of interest or value, jot it down and send it along—no matter if it isn't put in good shape; if that the facts are there it will be acceptable, and RURAL readers shall have the benefit of it. It is the Editor's business and duty to put things in proper shape, and this is what we are here for. We have great reverence for facts from any source, and if our ideas will not harmonize with facts, we modify them very promptly.

National Grange Proceedings.—The full and official proceedings of the Ninth Session of the National Grange, recently held in Louisville, has been issued in a neat book of more than 200 pages. Each Subordinate Grange is to be supplied with one, and we presume that an additional edition will be provided for those who wish to purchase, as many Patrons do. The exceedingly prompt publication of these proceedings reflects great credit on the reporters, and especially upon Secretary O. H. KELLEY, whose energy pushed it to completion.

The N. Y. Horticultural Association Society—Will hold meetings on the first Wednesday of each month, in Room 24 Cooper Institute building. An exhibition of novelties is expected at each meeting, and suitable arrangements will be provided therefor. More extensive general displays will be made in spring and fall. It is to be hoped that the gardeners and florists in and around New York City will take hold of this enterprise with zeal and make it a success.

A Centennial Printing Press.—The old hand-press on which BENJAMIN FRANKLIN worked one hundred and fifty years ago is to be placed beside one of Hoe & Co.'s lightning presses at the Centennial Exhibition. The press found its way to England, whence it was brought about thirty years ago by JOHN B. MURRAY and deposited in the model room of the U. S. Patent Office at Washington.

How to Remit.—In ordering the RURAL recollect that all remittances by P. O. Money Order, Registered Letter or Draft may be sent *at our risk*. By complying with this suggestion all will be safe, and we shall be spared the mortification of being accused of dishonesty, as we are occasionally by careless people who don't know how to remit.

RURAL BREVITIES.

ALL aboard of the good ship RURAL for 1876!

A NEW and dangerous cattle disease has appeared in Pennsylvania.

WILLIAM AYRAULT of Livingston Co., N. Y., has bought 350,000 lbs. of wool this season.

FIVE million dollars' worth of cotton was wasted this year for want of picking. Bad weather was the cause.

How many readers of the RURAL have grapes for daily use about these days? Those who have not, should prepare for planting some of the long-keeping varieties.

A TWO-YEAR-OLD Clydesdale filly was recently sold by Mr. CUNNINGHAM of Whitcairn, Scotland, for 1,000 guineas. This is better than the average price of fast horses.

THE trotting stallion Rhode Island, formerly owned by ex-GOV. SPRAGUE, and sold only two or three weeks ago for $6,000, is dead. The losing purchaser was Lieut.-Gov. SESSON.

WE need a Plimsoll in this country. The Chicago Inter-Ocean shows that there are thousands of unseaworthy traps afloat in the lakes. Congress should be memorialized on the subject.

DON'T FORGET, that any *Subscriber* to the RURAL can send the paper *as a Present* to any address at the lowest club rates—only $2.15 per copy, including postage. Many are availing themselves of this offer. The advantage of such a present is that it renews itself every week, creating friendly remembrances of the giver fifty-three times in the year. This is something worth thinking about and acting upon.

BUSINESS NOTICES.

BRIDE & CO.,

769 Broadway, N. Y., want agents for the best money-making article in the world. Send for particulars.

"A Slight Cold," Coughs.—Few are aware of the importance of checking a cough or "SLIGHT COLD," which would yield to a mild remedy, if neglected, often attacks the lungs. "*Brown's Bronchial Troches*" give sure and almost immediate relief.

THE OLD MAN'S GREETING.

BY JOY ALLISON.

So ye are back, Old Winter!
Reckon there's something wrong,
For I aint so glad to see ye
As when I was young and strong.

Ye see I'm gettin' on in years—
Stiff in the j'lints and slow;
Blood don't leap so lively
As forty year ago.

T'winges o' pain beset me,
Tetches o' rheumatis—
They say I must expect such things,
I don't know how that is.

But I like my nook by the fireside,
And my pipe, and my easy chair,—
And I'm glad to think o' the cellar
Where there's food enough and to spare.

And I'm glad to think o' the wood-house
Where the fuel is piled so high,
And the mows of hay for the cattle,—
'Tis well the barn is nigh.

There's nothin' lackin' for comfort,—
I've looked out for ye, in my plan!
For my dear old wife will tell ye
I was allus a forehanded man.

But in my day I've seen enough
O' storms;—and I'm glad to know
In the land to which I'm hastening
Will be neither cold nor snow.

Our Story-Teller.

THE NEW YEAR'S GIFTS.

BY MARY D. BRINE.

"If I go, Millie Harrington, do not look in me for any such weaknesses as have been ere this exhibited by your previous score of admirers. I, at least, have the will and ability to abide by my decision. No woman on earth can make a fool of Rafe Somers!"

Millie raised her head with icy hatred. "If you go? Pray, sir, do not trouble yourself to decide yes or no in so small a matter. Allow me to decide for you," crossing the room and touching the bell with steady hand. "John, Mr. Somers desires his hat and overcoat; have them at his service immediately."

The man withdrew, inwardly deciding that "there was somethin' up 'tween miss and her handsome lover, kase he hadn't seen sich high and lofty looks afore, he knew."

Meanwhile Rafe and Millie stood before each other proudly defiant, betraying nothing of the emotion which, truth to tell, forced each heart to quiver with pain. Never had Millie looked so beautiful, thought Rafe, and never had he cared for her more than at that moment of final parting. Indignation had flushed her usually pale face and given a sparkle to the dark eyes that only increased their beauty. She had drawn her stately figure to its full height, and Rafe had never seen his betrothed so regally attractive before. He had no idea that his own face appealed as strongly to her heart as hers had to his own. But she saw, with her quick woman's heart and eyes, how noble a specimen of manhood her own words had dismissed from her side forever. O! tender blue eyes, that had questioned her dark ones so many, many times! O! proud and manly heart that had laid itself at her dainty feet so long ago and worshipped till her own had stooped to meet its love. What of the days, weeks, months, and years to come, with only silence between the two! But pride was busy with its small though deadly venom, and into each heart the poison sank deeply while, with mute lips and flushed faces, the two who had been lovers turned apart from each other as the servant entered, and bowed a last adieu.

Rafe, while putting on his overcoat in the hall, caught the light humming of the opera air which escaped Millie's lips for that very purpose. "Cry before he had left the house?" said she to her grieving heart; "never! he must learn that a woman can scorn weakness as well as the other sex, and I'm weary and worn out with his unjust questioning of my will!" Then Millie walked to the window and drummed on the panes with assumed carelessness until Rafe, stung to the quick with her heartlessness, slammed the door and rushed down the stoop and out of sight in the darkness.

No more humming of opera airs then—no more idle drumming on the window pane for Millie after that. *Au contraire*, the twilight shadows, gathering so rapidly, folded the prostrate figure that lay sobbing on the sofa more closely in the mantle of darkness, and the proud eyes so lately scorning tears, were glad to give them vent at last, now that the friendly shadows kept her secret safe. In an hour she and Rafe were to have gone together to the Opera to hear the latest new star—and Millie's passion was music. Well, "she would not allow her enjoyment to be interfered with through trouble with Rafe Somers," was her indignant thought. "Gardy" would escort her of course, and Rafe might offer his services where it should please him.

"Gardy," the mild-eyed, placid, middle aged gentleman who had shouldered the responsibility of Millie and her fortune solely out of love for the orphan's parents, was sitting quietly at rest with his sister in the cosy up-stairs sitting-room, and enjoying to the full his fragrant Havana, when the disturber of his peace, flushed and still indignant, entered the room. "Mr. Somers will be absent this evening, Gardy; you will take me to the Opera House."

"Bless my soul! Put on my boots and take a fresh drive just to hear Singnor Bawlina or Madame Squallina upset the nerves of respectable people, myself in the bargain?" exclaimed Mr. Rand, with elevated brows. "And pray why must a quarrel between two lovers interfere with my comfort, Miss Crimsoncheeks, eh?"

Expostulation, however, availed nothing, and to the opera they went, Millie and her guardian, and with them also a gentleman who called upon Millie just as they were leaving the house, and at her invitation entered the house with them.

And what of Rafe Somers meanwhile? He, too, remembered the opera, and, notwithstanding his sore heart, he would attend it, as he knew Millie would, and she should see as much composure on his part as on hers. Very silly, no doubt, all his pride and obstinacy, but quite the fashion when lovers are silly enough to quarrel. And Millie and Rafe were like all the rest of mankind or womankind. What right had she to go where she was not willing her betrothed should discover her? And yet he had seen her several times conversing with a strange gentleman on the steps of a strange house in an unfrequented part of the city. Aye, worse, he had seen Millie Harrington enter the art rooms of Straus' on Broadway, in company with that same man. And he had been too far off to speak or attract her attention, and it was doubtful, he fancied, if she would have recognized him willingly if he had been near enough for that purpose. He considered that his betrothal with Miss Harrington gave him every right to her confidence, and yet this one thing she withheld from him, for no amount of argument would compel her to deal frankly with him.

"No, Rafe," she would answer. "I do not question you, and you must not question me. Some day I think you'll be ashamed of yourself, but until then I am ashamed for you!" And that was all he could get from the haughty lady love he worshipped so truly. But that Millie had loved him, he felt sure, and recalled her many acts of tenderness and love with such a weary pain in his heart as almost to bring tears to the proud blue eyes, unmanly tho' it might be. But he had said that "if he left her in anger he would never return," and nothing should cause him to retract his word. So he dressed for the opera and sat all the evening before Millie's box, growing more and more jealous as he watched the beautiful face and noticed her kindly manner toward the stranger who sat beside her. Millie did not fail to see him, although never had she seemed so careless and light-hearted. "Utterly heartless!" decided Rafe, indignantly, while Millie knew herself to be more wretched and sick of heart than ever before in her young life.

So the evening wore on, and when the curtain fell for the last time Millie gladly arose and left the house, only longing for the solitude of her own room and the relief of tears. Days passed. Mr. Rand questioned his ward as to the cause of the misunderstanding between herself and Rafe. But, to his surprise, she refused to explain, and retired behind that haughtiness she could don so well, until even her loved guardian was awed into silence. "He couldn't pretend to follow all Millie's queer whims," was his reply when the dear old sister, who played the role of propriety and matronized the small family, expostulated with him for allowing the girl so much liberty. "Let her alone, my dear," he would reply; "the child is well enough if you don't vex her. And bless me! if I know what to do when she lifts that grand head of hers and looks at me as if she were the queen and I a refractory subject."

So Millie was allowed to have her own way, and after one more mysterious visit to the strange house she ceased to offend in that way, and went out accompanied only by her guardian's sister.

New Year's day was drawing near, and Rafe Somers dreaded it for the first time since his first experience of that day's pleasure. He had spent the last New Year's day mostly with Millie, returning to her side from his numerous calls, and gladdening heart and eyes with her presence for a happy time before starting on another round of calls, which propriety demanded he should make. And he knew just how she would look this time. Like a young queen in her royal robes, receiving graciously her subjects, and dispensing her sweet smiles alike to each who were privileged to call upon her. And *he*, the once dearly loved friend and betrothed—he who had received the secret pressure of her small hand, and read his own sweet welcome in her dark eyes—must remain outside of her presence forever more, and see her only in his dreams. No words could tell how he longed to go again to her side and fold his arms about her. But "no woman shall make a fool of Rafe Somers!" his lips had said, defiantly. And should he humble himself after all?—not he! So he bore the cruel pain which fed on his heart each day, nor dreamed that even pride could not quite conceal his grief from curious eyes. There were whispers among mutual friends concerning the broken engagement. The pledge of betrothal was missing from Millie's white finger. And from Rafe's chain the little golden circlet his clumsy finger could not squeeze through, had suddenly departed. But no tongue dared question either the lady or gentlemen of the matter, and wider and wider in silence grew the gulf between the two hearts.

Christmas Day had passed. Millie's presents as usual from friends and admirers, were numerous and beautiful. But she missed one whose love had never failed her at this season, and grew weary ere half the bright day had gone. Rafe, for something better to do, he said to himself, went about the streets and hunted up forlorn little beggars, gladdening their half-frozen hearts with some toy or cake or useful article, longing with heart and soul meanwhile, that he might dare send something to Millie, even though his name were withheld. But the day slipped away and the gulf of grief and pride had narrowed not one whit.

Not one word had passed between the two, even of recognition, since the last angry words of their parting, and Rafe had refrained from passing the house lest it should be more than he could bear if her face were seen at the window pane. But two days after Christmas some impulse beyond his powers of resistance led him by the house which held all his thoughts. Closed blinds at the windows of Millie's room! What does it mean? And sawdust sprinkled thickly over the stones in the street before her door! And even the bell knob fastened, that its ring might not disturb the house! Rafe's heart sank with a sudden fear. O! what had happened to his love!—what had happened to her against whom his heart had no more resentment? A doctor's buggy stood before the house, and as Rafe paused the doctor himself came gravely down the steps. Impulsively Rafe touched his arm. "Tell me, sir, who is ill at Mr. Rands'. They are friends of mine and I have not seen the family for a long time!"

"Miss Harrington is exceedingly and dangerously ill," came the reply, while the doctor's quick eyes scanned the young man's eager face, and his prompt reasoning formed its own conclusion. "Miss Harrington is suffering as much from mental distress as physical pain," he continued gravely, "and in her delirium she calls a name which is evidently dear to her. Doctors are compelled to hear secrets occasionally, and from all I can learn Miss Harrington has been greatly suffering in her mind for some time past. If you are a friend of the family, sir, perhaps you can assist her recovery. Pardon me, but I do not think it necessary to speak plainer."

"A lover's quarrel; I knew it all along, and that young fellow, if I mistake not, is the lover himself! Whew! what geese young folks are to be sure!" Thus thought the doctor driving rapidly towards his next patient, while Rafe, bewildered, ashamed, and wild with

SEASONABLE SCENE.—A MISHAP ON THE ICE.

fear for MILLIE'S life, forgot his pride, his "ability to abide by his decision, and all the arguments of right on his side with which he had thus far encouraged himself in his proud obstinacy, and hurried down the basement steps to ask more particularly about MILLIE'S condition.

"Sure, Mister RAFE, an' it's a long time since we seen yees here. Is it out of town ye've been?" questioned the buxom Irish maid on opening the door.

"Never mind, never mind where I've been," was his hasty reply; "only tell me will Miss MILLIE live!"

The girl's honest eyes filled with tears. "It's powerful weak she is, sir, and no one allowed to see her only mesand Mr. RAND. Sure, I can't tell at all whether it will be that she will die or not. The Vargin save her, sir! Shall I tell Mr. RAND you would like to see him?"

RAFE waited impatiently until the message came for him to walk up stairs and Mr. RAND would meet him in the parlor. The familiar parlor! RAFE looked about him sadly. There was the piano where he and MILLIE had sung together hour after hour, and he could almost see the white fingers dashing over the keys now, dropping melody wherever they touched. Every nook in the stately room was hallowed with the memory of MILLIE'S presence. So many glad evenings he had spent with her there! And ah, me! that last sad sad evening—could RAFE now wipe it from his memory? Then she had risen and faced his angry eyes with her own, dark, indignant glance. Cruel words had escaped the lips of both, and although it must be confessed the right was a little on RAFE'S side of the question, yet he had been exacting and unjustly suspicious, even when MILLIE promised a some-time explanation. "I do not choose to be questioned, sir!" came proudly from her lips, and repeated itself in the flash of her eyes and the uplifting of her stately head. And then followed his threat to leave her, with the result we have already seen. Oh! how RAFE'S heart ached. Here he stood again despite his decision, despite his pride, his obstinacy and all his anger—only longing to go to her bedside and take the dear head on his breast once more and kiss the fever-stricken lips that called his name. But the entrance of Mr. RAND aroused him from thoughts fast unmanning him.

A quiet hand-shake, and after the gentlemen were seated RAFE learned how MILLIE had wearied of her Christmas day, growing strangely feverish towards night, and on the following day had fainted, the doctor said, from mental trouble and physical exhaustion. The exact nature of the disease could hardly be known, but she was constantly delirious, and her cries for "RAFE!" "RAFE!" were pitiful to hear.

"And why was I not sent for," demanded RAFE, excitedly.

"Simply because if MILLIE had been conscious we knew she would not have seen you, and to disobey her will when she is powerless to prevent it is not my intention, young man. You have quarreled with my ward—why—how I know not, nor shall I question you; but whether she or you be in the wrong, from her lips only, if the summons come at all, will you be called to her side."

Mr. RAND spoke gravely, and RAFE was silent before him for a moment. Then—"Mr. RAND, will, will MILLIE live? If so, as soon as she is able, will you plead for me with her? I acknowledge my fault, and my love for her has never left my heart."

"If it be possible, RAFE SOMERS, I will do what you ask."

RAFE continued, "But if—if MILLIE should—Oh, Mr. RAND! if MILLIE should not recover, I pray you have a little pity and let me kiss her just once for the last time. If she should be unconscious, my kiss cannot offend her; and Oh! it will be all of comfort left me in the world!"

Tears filled the guardian's eyes and he grasped RAFE'S hand. "Be calm, my boy; all may yet be well; but we have been very anxious those two days past. I fear the New year's Day will have but a sorry dawning for this family. God grant I may be mistaken!"

Then RAFE, with one despairing glance around the room, went silently out into the busy street where mankind guessed nothing of his repentant, grieving heart; and Mr. RAND crept softly up to relieve for awhile his sister's watch beside MILLIE.

New Year's eve—a lonely, starry night!—and from a thousand homes glad, cheerful lights were flashing, and life within seemed over-flowing with comfort and joy.

But Mr. RAND'S house was dark and cheerless, and the dim light that shone from MILLIE'S room could scarcely pierce the drawn curtains in its feebleness.

RAFE sat alone in his room. Down stairs the boarding-house—his temporary home—was alive and ripe rich music and mirth, which his sad heart forbade his sharing. Suddenly a messenger brought the hastily-scribbled words,

"Come at once! E. RAND."

Out through the silent streets, past the merry homes, he hurried, until at last the darkened house of sickness was reached, and Mr. RAND himself admitted RAFE SOMERS. Then up to the darkened room, where the doctor and Miss RAND waited and watched with grave faces beside the unconcious girl whose face was whiter than the snowy pillow beneath her head. RAFE stood one instant in mute despair.

"Say your farewell, my dear boy, and may GOD comfort you to-night," whispered Mr. RAND, laying his hand tenderly upon RAFE'S shoulder.

RAFE was beside MILLIE instantly, and his lips sought her brow, the closed eyes, and the still white mouth with a love that heeded not the presence of others. Tears he did not, even for his manhood's sake, try to restrain, fell from his eyes and wet the dark tresses that lay all unbound over the pillow. O! if his last words to her had been aught but those of anger! If his last look at her dear face had been born of love rather than of angry, jealous resentment! If he could have taken her in his arms and whispered the tender farewell of previous partings; then, ah! then it might have been that his last, bitter farewell would be easier to bear. "O! my MILLIE—my love!" he groaned, unable to control his anguish. And the eyes of those who watched him grew misty, and they turned their heads away.

"How long, Oh! Doctor, how long may I stay beside her?" whispered RAFE, with eyes and lips together. And the doctor replied, "Till the end, which may not be till morning." And RAFE bowed his head upon the pillow.

Slowly the hours passed, and presently the distant chime of the New Year's bell broke the silence of the weary night. Twelve o'clock, and the old year had slipped forever into the past, while the new young king ascended the throne amid the greeting of bells and the welcome of those who had "watched the old out and the new in!" But the young life so dear to the few who watched in silence at MILLIE'S bedside, had not yet gone out, and while there was life there was also hope—so said the doctor. And RAFE clung to the tiny thread of hope as a drowning man clings to a straw, and there were prayers in his heart that the death-angel himself in pity carried to the throne of GOD. And while the shadow of his wing was lifted from that silent chamber, as he sped on his kind mission, the dawn of the New Year crept softly into the room, and MILLIE'S eyes opened for the first time in many days. Even as RAFE'S silent prayer that GOD would spare the dear life was speeding upward, the answer came graciously, and the angel of death returned not again.

Quietly the invalid's gaze wandered about the room and rested upon the familiar faces. Then came the low-toned question, faint and trembling, "Have I been ill?" A quiet answer, and also the doctor's request that she should not speak, satisfied and rendered MILLIE obedient, and a refreshing sleep followed.

"This package for Miss MILLIE came last night, sir," said the maid, whispering outside the door. And Mr. RAND laid a small parcel upon MILLIE'S table, then renewed his watch with RAFE over the slumbering girl.

"The crisis is passed and she will live," said the doctor, with a glad smile. "And you, young sir, can effect what ever cure your own heart thinks right, for, if I mistake not, *my* skill alone will avail nothing."

RAFE'S face flushed, but he knelt beside MILLIE, and looked into her waking eyes with a gratitude to GOD which none could guess. Mr. RAND, his sister and the doctor left the room silently for a moment, and RAFE was alone with his precious New Year's Gift—the life restored to him of her he so dearly loved.

MILLIE recognized him quietly, with a faint smile and weak pressure of the hand. "When did you come, my RAFE?" she whispered, after he had given her the cordial ordered by Dr. MASTERS. And he told her of his night's watch beside her bed—of his repentance and grief, and of his love for her, which no distrust, no resentment could ever again injure.

And all that while the New Year's Day grew brighter and gladder with sunlight and heart-sunshine, and MILLIE'S hand laid within RAFE'S while his warm clasp aided her pulses in their new struggle for life and health. When her guardian and patient Mrs. RAND re-entered the room MILLIE had again fallen asleep with her head upon RAFE'S arm, and in his hand he held a beautiful India-ink portrait of his love. Underneath, in fine German text, ran the words, "*A New Year's Gift to Rafe from Millie.*"

And that was the secret of her private visits to the artist's house. Lest he or any one should suspect her gift she had gone, without even her guardian's knowledge, from time to time, sitting as long as she dared and pleasing herself with thoughts of RAFE'S delight. And he, questioning her imperiously, roused her haughty will against his, and hence the suffering on both sides. RAFE thought it all over during MILLIE'S slumber, and kissed lightly the lips so near his own with new resolves for the New Year.

"Two gifts—two New Year's gifts for me this day!" he whispered when she awoke. "Your precious life and this dear portrait. Oh, MILLIE, MILLIE! what can I give you, darling?

"Only your love and trust, RAFE."

MARRIAGE CEREMONIES.

THE ancient practice of marriage by capture, which has left some traces even in our customs and sports—notably in that popular game of kiss-in-the-ring, a mimic representation of the great game of marriage—finds many illustrations in this Mongol life. Rubruquis, who visited the hordes of Tartary and was entertained in the tent of the immediate successors of Yenghis Khan, describes a Mongol marriage thus: "Therefore, when any man hath bargained with another for a maid, the father of the damsel makes him a feast; in the meantime she flies away to some of her kinsfolks to hide herself. Then the father says to the bridegroom, 'My daughter is yours; take her wheresoever you can find her.' Then he and his friends seek her until they find her, and, having found her, he takes her by force and carries her to his own house." This simple form of marriage contract is still preserved among the Koraks and Tchuctchus, tribes of north-western Siberia. There the damsel is pursued by her admirer, and hides herself among the prologs, or cabins made of skin, which forms the internal compartments of their dwellings. The womankind assist her in her pretended evasion, and not till her bridegroom has caught his bride and left the impression of his finger-nail upon her tender skin is the betrothal completed.

The analogous customs in ancient Roman marriages here strike one with the myth of the rape of the Sabines; but we need not go far ahead. The customs of a Welch wedding up to a very recent date, included a mimic pursuit of the bride by the bridegroom, both on horseback; and even in our English manner, when the bridegroom goes to seek his bride on the wedding morn. But the value of womankind in a pastoral life, where there is so much for her to do in the way of milking, cheese and butter making, and so on, brings a further element into the relationship. A price must be paid for the future companion, and the kalim or wedding portion enters largely into the question.

A more modern Mongol wedding is described by Huc, that most amusing of Jesuit fathers. The religious ceremonies are those of Buddhism. The marriage is arranged by the parents, who settle the dower that is to be paid to the father of the bride by means of mediators. When the contract has been concluded, the father of the bridegroom, accompanied by his nearest relatives, carries the news to the family of the bride. They prostrate themselves before the domestic altar and offer up a boiled sheep's head, milk and a sash of white silk. During the repast all the relations of the bride receive a piece of money, which they deposit in a vase filled with wine made of fermented milk (we have, or had, a similar custom of hiding a ring or money in the wedding cake,) the father of the bride drinks the milk and keeps the money. The lamas, or priest, fix an auspicious day, when the bridegroom sends a deputation to escort the bride. There is a feigned opposition to the departure of the bride, who is placed on a horse and led three times—note the three mystic circles—round the paternal house, and then taken at full gallop to the tent prepared for the purpose near the dwelling of her father-in-law. All the Tartars of the neighborhood repair to the wedding feast and offer their presents, which consist of beasts and eatables. These go to the father of the bridegroom and often restore him the sum which he has paid for the son's bride. Rather a shame, one would think, of that selfish papa, did we not reflect that he will have to support his son and daughter, or at all events set them up with sheep and cattle from his flocks and herds.

MARRIED THROUGH THE WINDOW.

A WRITER relates the following: A clergyman on one occasion waited for a couple in his parlor one evening, and as they did not keep their engagement, he went to bed. Just about half past eleven o'clock the door bell rang violently. He put a cap and a wrapper on, and, in a state of general undress, opened the second story window and looked out. There stood the tardy candidates for matrimony.

"Well, its too late now," said the clergyman, "and it's too cold."

"Yes," called up the man, "but we missed the train, and I sail to-morrow."

"Well, then, go to some other minister," answered the irate parson.

"We can't now," both shouted up from the garden-walk, "it's too late."

"Well, I can't marry you now," he said; "the servant has taken the front-door key and has gone to sleep."

"Well, then, marry us out of the window," came up from below.

And so the minister took the book in hand and called out the directions from the second story casement, and the parties complied with the several orders, and finally left the fee in an envelope under the front-door, and went out of the garden-gate man and wife.

A CENTENNIAL CHESS-BOARD.

THE Swedish wood-carver, Oestergren, favorably known in England, is said to be preparing a chess-board for exhibition at the World's Fair, in Philadelphia, the pieces of which are symbolical of the struggle between Ultramontanism and the modern spirit in Germany. On one side of the board appear the Emperor William and the Empress Augusta as King and Queen, Prince Bismarck and the Minister Falk as Bishops; the knights are Prussian Uhlans and the pawns are soldiers and recruits. On the other hand stands Pius IX. as King, while his queen is an Abbess holding waxen-taper, well-nigh burned out. The Bishops are Cardinals, the Knights are monks riding on asses, and the pawns are monks on foot. Oestergren was, for many years of his life a paper-stainer, and it was not until he was fifty years old that he passed an examination in drawing at the Academy of Arts, in Stockholm, and began to draw and carve on wood. This is fourteen years ago; he is now celebrated for the grace and originality of his productions.

IN the lives of the saddest of us there are bright days when we feel as if we could take the great world into our arms. Then come gloomy days when the fire will neither burn on our hearths nor in our hearts, and all without and within is dismal, cold and dark. Believe me, every heart has its secret sorrows, which the world knows not of, and oftentimes we call a man cold when he is only sad.

IT is only our mental duration that we measure by visible and measurable objects; and there is nothing mournful in the contemplation for one who knows that the Creator made him to be the image of his own eternity, and who feels that in the desire for immortality he has one proof of his capacity for it.—*Southey.*

Sabbath Reading.

THE CREATOR'S POWER.

NOT worlds on worlds in phalanx deep
Need we to prove a God is here:
The daisy, fresh from winter's sleep,
Tells of His hand in lines as clear.

For who but He that arched the skies
And pours the day spring's living flood,
Wondrous alike in all He tries,
Could rear the daisy's purple bud?

Mold its green cup, its wiry stem,
Its fringed border nicely spin,
And cut the gold-embossed gem
That, set in silver, gleams within?

Then fling it unrestrained and free,
O'er hill and dale and desert sod,
That man, where'er he walks, may see
In every step the stamp of God.

[*John Mason Good.*

THE BIBLE.

THE following beautiful tribute to the Bible, we copy from the writings of Theodore Parker:

This collection of Books has taken such a hold on the world as no other. It is read of a Sabbath in all the ten thousand pulpits of our land; the sun never sets on its gleaming pages. It goes equally to the cottage of the plain man and the palace of the king. It is woven into the literature of the scholar and colors the talk of the street. The barque of the merchant cannot sail the sea without it. No ships of war go to the conflict, but the Bible is there. It enters men's closets, mingles in all the griefs and cheerfulness of life. The affianced maiden prays God in Scripture for strength in her home duties; men are married by Scripture; the Bible attends them in their sickness—when the fever of the world is upon them; the aching head finds a softer pillow when the Bible lies underneath. The mariner, escaping from shipwreck, esteems it the first of his treasures, and keeps it sacred to God. It goes with the pedlar in his crowded pack, cheers him at eventide when he sits down, dusty and fatigued, and brightens the freshness of his morning face. It blesses us when we are born, gives names to half of Christendom, rejoices with us, has sympathy for our morning, tempers our grief to finer issues. It is the better part of our sermons; it lifts man above himself—our best of natural prayers are in its stolid speech, wherewith our fathers and the the patriarchs prayed. The timid man about awakening from this dream of life, looks through the glass of Scripture, and his eye grows bright; he does not fear to stand alone, to tread the way unknown and distant, to take the Death Angel by the hand, and bid farewell to wife, and babes, and home! Men rest on this their dearest hopes. It tells them of GOD, and His blessed Son; of earthly duties and of heavenly trust!

A BEAUTIFUL ANSWER.

WHEN the Emperor of Germany was lately on a visit in a distant portion of his dominions, he was welcomed by the school children of the village. After their speaker had made a speech for them he thanked them. Then taking an orange from a plate he asked:

"To what kingdom does this belong?"

"To the vegetable kingdom, sir," replied the little girl.

The Emperor took a gold coin from his pocket, and holding it up, asked:

"And to what kingdom does this belong?"

"To the mineral kingdom, sire," replied the little girl.

"And to what kingdom do I belong, then?" asked the Emperor.

The little girl colored deeply, for she did not like to say "the animal kingdom," as he thought she would, lest his majesty should be offended, when a bright thought came, and she said, with radiant eyes:

"To GOD'S kingdom, sire."

The Emperor was deeply moved. A tear stood in his eye. He placed his hand on the child's head and said, in the most devout manner:

"Grant that I may be accounted worthy of that kingdom."

HAPPINESS CONSISTS IN LOVE.

As the affections are the noblest ingredient in human nature, so the elevation and happiness of a human being mainly depend on the right bestowment and ample exercise of these affections. To be self-sufficient and self-seeking—that is to keep all the affections to one's self,—is the meanest and most miserable predicament a creature can be in. The homestead of a fine spirit—much more the desolate chamber of a sinful heart—does not contain resources enough for its own blessedness. The soul must go out from itself, if it would find materials of joy. And just as its happiness depends on going out from itself, so its elevation depends on its going up—depends on its setting its affections upon something higher than itself, something nobler or holier or more engaging. The main part of true religion is the right bestowment of the affections. When they are set on the things above they are set as high as a seraph can set his. They are set so high that they cannot fail to lift the character along with them, and make him a peculiar character whose ends in living are so lofty.—*James Hamilton.*

THE New Year is the time to reform and persevere therein. Why not continue in well doing through the Centennial Year?

Ladies' Portfolio.

A GOOD NIGHT.

BY ROSE GERANIUM.

THE day is done, dear world, good night!
Repose falls like a mother's tresses,
That shut from infant eyes the light
With tender touches and caresses.

I would that in an hour like this,
By night, on wings all starry gleaming,
My spirit might be lulled to bliss
And pass to Heaven 'mid happy dreaming!

A DEED AND A WORD.

A LITTLE spring hath lost its way
Amid the grass and fern;
A passing stranger scooped a well,
Where weary men might turn;
He walled it in, and hung with care
A ladle at the brink;
He thought not of the deed he did,
But judged that toil might drink.
He passed again, and lo! the well,
By summer never dried,
Has cooled ten thousand parched tongues,
And saved a life beside.

A nameless man, amid a crowd
That thronged the daily mart,
Let fall a word of hope and love,
Unstudied, from the heart:
A whisper on the tumult thrown,
A transitory breath;
It raised a brother from the dust,
It saved a soul from death.
O germ! O fount! O word of love!
O thought at random cast!
Ye were but little at the first,
But mighty at the last!

SPARE ROOMS IN RURAL HOMES.

BY MRS. E. F. G.

IN these latter days, it may be almost deemed a misfortune for people of moderate means to possess a large house, so much more is expected of them than of their neighbors who dwell in dovecotes. There seems to be no earthly reason why all the sewing societies, sociables, committee meetings and surprise parties should not be welcomed. Whole families from the city may quarter themselves upon them during the summer months and the district schoolmaster must have a home and separate chamber for the whole winter. Why not, pray? They have plenty of room, and their neighbors think, "If I only had such a house, I would be glad," etc. So they are beguiled into entertaining more than they can afford to do, and more than their own inclinations would dictate, because they have a pleasant home. What else can they do? There is the fact of space, and to refuse the use of it would seem inhospitable.

But this is not, after all, the greatest disadvantage of having more apartments than one needs for actual daily use. There is the expense of furnishing and warming and the labor of keeping them in order, to say nothing of the money invested in the house itself. Our ancestors managed all this easy enough. If they had more rooms than they needed they simply shut them up, and only opened them for weddings, funerals, and other great occasions. Their chief care in the matter was to keep their house in order, not knowing the day nor the hour when its use would be made necessary. A modern housewife does this at her peril. Not only will fashionable people denounce her, but the whole array of health writers and sensation writers and people who don't know what they are writing for, will be against her, until she would gladly retreat into one of the little snuggeries whose inmates envy her so much. The "spare rooms" of New England are a perpetual target for the wit of romance writers and a remark that "a shut-up room is a nuisance anywhere," is so standard that it is stale.

There would be more sense than there is in this kind of talk if it were always our fortune to build our own houses, though even then we are apt to build for prospective as well as for present necessities. A family with small children, feeling the necessity for the strictest economy, will not need, or rather cannot afford, to use as much room as they will want when the farm is paid for and the children are grown up; but they may be pardoned if in planning their home, which is to be theirs in the future as well as the present, they make it more like their ideal home than the one which their present circumstances will allow them to furnish and inhabit. If we have no time or money now to spend elsewhere than in the kitchen, must we never expect to have a parlor until our house shall take to itself wings? Because every cord of wood that can be spared from the kitchen stove must go to town to pay grocers' bills, and we are obliged to use ingenious devices to make one fire warm as many apartments as possible, may we never dream of a time when we can afford plenty of the best fuel, and allow half the heat to go up the chimney? Dr. HOLMES has said that this is indispensable to a cheerful room, but he is careful to prescribe it only for the "mansion houses."

In this country too it often happens that we occupy where another built, and in most cases we must take things as we find them, or at best make a few inexpensive alterations for our own convenience. A man of property, especially a farmer, is very likely in his will to leave the homestead to one of his sons, with the provision that he shall pay certain sums to the other members of the family. Now would it be sensible, or even honest, for this young man and his young wife, who have all this debt upon their shoulders, to insist on furnishing the whole establishment and keeping it warm every day, when they can possibly have use for but three or four rooms?

The Freedmen at the South would easily get out of this dilemma. I recollect a little incident that will illustrate what I mean. Across the way from my boarding place in Chattanooga, a few winters since, was a group of dwellings belonging to the colored people. Having scraped enough money together to purchase little patches of ground, they put up such buildings as they were accustomed to, and which in their opinion did well enough. It was interesting to watch the improvements constantly going on in this neighborhood. First it was a pen for a calf—the pig usually had lodgings under the house—then perhaps a little stable for a cow or a pair of mules; then a new fence would be built, always outside the old one and encroaching a little upon the street. As soon as they could afford it, if they had room enough, they would erect a second cabin on the corner of their lot, to rent. At last came an improvement which I was wholly unprepared to see. One of the houses was larger than the rest, having a wing at the back for a kitchen, while the front was two stories high. I thought the owner must be an aristocrat, of course. One day I saw two or three men engaged in pulling this structure down. The next time I went into the street I asked the owner what they were going to do. "It's too high and too big,—I don't like it," was the answer. Now in this case, where a couple of workmen could rebuild the house in a few days from the old material and have enough left for a calf-pen, who can wonder that the owner was unwilling to live in a house that he did not like? But a man would be considered a lunatic who should pull down half his father's handsome residence because he had no present use for it, when it is almost certain that within a dozen years he will need every inch of it. As a family increases more room is needed; that is to say, a large family requires more room than a small one, and the natural tendency is for small families to become large ones.

A sitting-room, which, from its sunny exposure, is pleasant in winter, may be uncomfortable in summer from the same cause. Now, since it is not our custom to fold our tents like the Arabs, how shall we provide for the incidents of company and climate, and changes in the household, unless we arrange for more room than is necessary for the family while at its smallest? It would be absurd for an old man and woman, whose children are all married and moved away, to keep their whole house in the same receptive state as on the evening when the last daughter was married. Indeed I never could see the harm of keeping spare rooms, ready for use when you need them, any more than that of keeping spare garments for the same purpose. It is said that uninhabited rooms have a charnel-house air, and all that. I say, Bosh! and can think of nothing better to say. You need not allow your rooms to get musty, mouldy and cob-webbed because you do not live in them. Open the window now and then, and brush them out a little. Have your furniture well arranged, and the *things* that give a home-like air, and your guests will enjoy themselves when the rooms are opened, though not a chair has been occupied for a month. It is the disposition of furniture more than occupation that gives a pleasant impression; and sofas are more likely to be shrouded in Holland, and piano legs in baize, in a room were everybody's feet are playing antics, than in one that is in some measure secure.

After all that I have said, I must allow that I like a house well furnished, well lighted and well warmed throughout. I would like to keep the rooms open every day in the year, and see them filled with happy faces. I would like my carriage and horses to be models in their way, and would be glad to dress in velvets, heavy silks, and India muslins every day of my life, could I do it with perfect justice to all concerned. But I must be allowed the privilege of deciding whether I can afford these things or not, and I am as little disposed to accept dictation in the one case as in the other.

So long as I can give to my hired assistants convenient working places, to my family pleasant eating and living rooms, to my friends pleasant places for entertainment, and to all comfortable dormitories, I can not see that it is any affair of Mrs. GRUNDY,s how many suites of rooms I have locked up, any more than how many suits of clothing I have in my wardrobe which her eyes may never behold.

A woman who reads the literature of the day is forced to the conclusion that to keep a spare room is a crime against social laws, and unless she has self-reliance enough to follow her own ideas of right, she is in danger of sacrificing her own comfort, and her husband's earnings, at this one of Fashion's many altars. Carpets are often purchased, and, I may add, worn out, at the expense of creditors; the family go without comforts that they may keep up appearances; and the daughters, having little acquaintance with the kitchen, learn to despise it.

I want it understood that this protest is not written for the rich. If people are able to indulge in luxuries, I know of nothing more harmless than arrangements for warming the whole establishment, unless, indeed, these arrangements savor too strongly of smoke and carbonic acid gas. It is in behalf of those who must make sacrifices to accomplish this—sacrifices for which they do not receive an equivalent—that my one weak voice is lifted up against the great sea of voices surging on the other side.

No man's life is free from struggles and mortifications, not even the happiest; but every one may build up his own happiness by seeking mental pleasure, and thus make himself independent of outward fortune.

Reading for the Young.

WILL THE NEW YEAR COME TO-NIGHT, MAMMA?

WILL the New Year come to-night, mamma? I'm tired of waiting so;
My stocking hung by the chimney side full three long days ago.
I run to peep within the door at early morning light;
'Tis empty still. Oh, say, mamma, will the New Year come to-night?

Will the New Year come to-night, mamma? The snow is on the hill,
And the ice must be two inches thick upon the meadow's rill;
I heard you tell papa, last night, his son must have a sled;
(I didn't mean to hear, mamma,) and a pair of skates you said.

I prayed for just these very things, mamma. O, I shall be full of glee,
And the orphan boys in the village school will all be envying me;
But I'll give them toys, and lend them books, and make their New Year glad,
For God, you say, takes back His gifts, when little folks are bad.

And won't you let me go, mamma, upon the New Year's day,
And carry something nice and warm to poor old widow Gray?
I'll leave the basket near the door, within the garden gate—
Will the New Year come to-night, mamma? It seems so long to wait!

* * * * * *

The New Year comes to-night, mamma; I saw it in my sleep;
My stocking hung so full, I thought—mamma, what makes you weep?
But it only held a little shroud—a shroud, and nothing more!
And an open coffin, made for me, was standing on the floor!

It seemed so very strange, indeed, to find such gifts instead
Of all the toys I wished so much—the story books and sled;
But while I wondered what it meant, you came with tearful joy,
And said, "Thou'lt find the New Year first. God calleth thee, my boy!"

It is not all a dream, mamma—I know it must be true!
But have I been so bad a boy, God taketh me from you?
I don't know what papa will do when I am laid to rest—
And you will have no Willie's head to fold upon your breast.

The New Year comes to-night, mamma—your cold hand on my cheek,
And raise my head a little more, it seems so hard to speak;
You needn't fill my stocking now, I cannot go and peep,
Before the morrow's sun is up, I'll be so sound asleep.

I shall not want the skates, mamma, I'll never want the sled,
But won't you give them both to Blake, who hurt me on the head?
He used to hide my books away, and tear the pictures, too,
But now he'll know that I forgive, as then I tried to do.

And, if you please, mamma, I'd like the story books and slate
To go to Frank, the drunkard's boy, you wouldn't let me hate:
And, dear mamma, you won't forget, upon the New Year's day,
The basket full of something nice for poor old widow Gray.

The New Year comes to-night, mamma—it seems so very soon—
I think God didn't hear me ask for just another June;
I know I've been a thoughtless boy, and made you too much care,
And may be, for your sake, mamma, He doesn't hear my prayer.

There is one thing more, my pretty pets, the robin and the dove,
O, keep for you and dear papa, and teach them how to love;
My garden rake, the little hoe—you'll find them nicely laid
Upon the garret floor, mamma—the place where last I played.

I thought to need them both so much when summer comes again,
To make my garden by the brook that trickles thro' the glen:
I thought to gather flowers, too, beside the forest walk,
And sit beneath the apple tree where we once sat to talk.

It cannot be; but you will keep the summer flowers green,
And plant a few—don't cry, mamma—a very few, I mean,
Where I'm asleep. I'd sleep so sweet beneath the apple tree,
Where you and robin, in the morn, may come and sing to me.

The New Year comes—good night, mamma—"I lay me down to sleep,
I pray the Lord," tell poor papa, "my soul to keep;
If I—" how cold it seems—how dark—kiss me, I cannot see,
The New Year comes to-night, mamma—the old year dies with me. [*Cora M. Eager.*

THANKS to GEORGIE PATTISON of Marengo, Mich., and LAURA GULICK of Altoona, Kansas, for sending us copies of the above beautiful and affecting poem.—ED.

IF I COULD ONLY SEE MY MOTHER.

"If I could only see my mother!" Again and again was that yearning cry repeated—"If I could only see my mother!".

The vessel rocked and the waters, chased by a fresh wind, played musically against the side of the ship. The sailor, a second mate, quite youthful, lay in his narrow bed, his eyes glazing, his limbs stiffening, his breath failing. It was not pleasant to die thus in this shaking, plunging ship; but he seemed not to mind his bodily comfort; his eyes looked far away, and over and anon broke forth that grievous cry—"If I could only see my mother!"

An old sailor sat by, the Bible in his hand, from which he had been reading. He bent above the young man, and asked him why he was so anxious to see the mother he had willfully left.

"O! that's the reason," he cried, in anguish; "I've nearly broken her heart, and I can't die in peace. She was a good mother to me—O! so good a mother; she bore everything from her wild boy, and once she said, 'My son, when you come to die you will remember this.' O! if I could only see my mother!"

He never saw his mother. He died with the yearning upon his lips, as many a one has died who slighted the mother who loved him.

Boys, be good to your mothers.

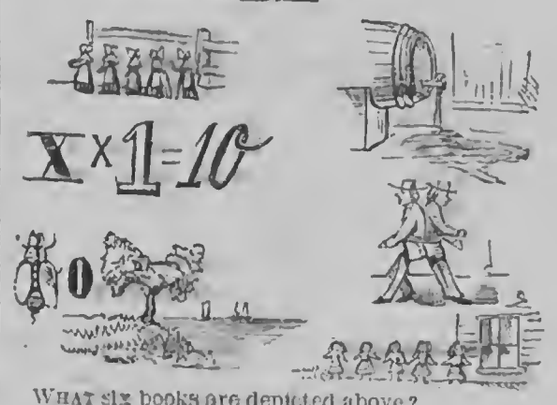
EARLY RISING.

THE difference between rising every morning at eight and six o'clock in the course of forty years amounts to twenty-nine thousand two hundred hours, or three years one hundred and twenty-one days and sixteen hours, which are equal to eight hours a day for exactly ten years; so that rising at six will be the same as if ten years of life (a weighty consideration) were added wherein we may command eight hours every day for the cultivation of our minds and the despatch of business.

"A MISHAP ON ICE," illustrated on a preceding page, is certainly a seasonable scene, and one which no doubt many of our young friends can appreciate. We hope, however, none break their bones, even if their baskets are upset, while enjoying the luxury of sliding on congealed water. Moral—Be careful, boys and girls, while carrying baskets of goodies. Otherwise you may have a mishap like unto that represented in our picture.

The Puzzler.

ILLUSTRATED REBUS.—No. 1.



WHAT six books are depicted above?

☞ Answer in two weeks. L. G.

CROSS-WORD ENIGMA.—No. 1.

My first is in Volga but not in Amazon,
My second is in Danube but not in Don;
My third is in Goa but not in Bog,
My fourth is in Douro but not in Bug;
My fifth is in Tagus but not in Rhone,
My sixth is in Allire but not in Doedogne;
My seventh is in Umpqua but not in Yazoo,
My eighth is in Nueces but not in Rio Negro,
My ninth is in Seine but not in Oder,
My tenth is in Vistula but not in Tiber;
My eleventh is in Elbe but not in Kansas,
My twelfth is in Ebro but not in Matanzas.
My whole is a river of Spain. LITTLE ONE.

☞ Answer in two weeks.

BISECTED EASTERN CITIES.—No. 1.

1. VERY angry, and to deliver.
2. Contest between nations, and a cutting instrument.
3. Harbors, and a part of the body.
4. Part of a tavern, and human beings.
5. An acid fruit, and a pile of grain in the field.
6. Water impregnated with alkali, and a home of wild beasts.
7. A metal vessel for liquids, and a measure of weight.
8. A sack, and a name for father.

☞ Answer in two weeks. ISOLA.

WORD-SQUARE ENIGMA.No. 1.

1. A vessel for flowers. 2. An open space. 3. To burn over. 4. Organs of the head.

☞ Answer in two weeks. BERBIX.

DIAMOND PUZZLE.—No. 1.

1. A VOWEL. 2. A number. 3. A hard substance. 4. One added. 5. The remains of a fire. 6. A number. 7. A consonant. The centrals make one more. S. C.

☞ Answer in two weeks.

PUBLISHER'S SPECIAL NOTICES.

The Rural is a very good present to send to a friend, and it pleasantly reminds the recipient of the donor fifty-two times a year—this year fifth-three times. Any *subscriber* can send it to a relative or friend, as a present, at our lowest club rate—only $2.15, including postage.

Holiday Presents will be plenty this year among our Agent-Friends and others who form clubs for RURAL. Our list comprises many articles appropriate for presents. Induce a few of your friends to take the RURAL, and thus secure a Premium.

Officers of Agricultural Societies and Clubs, Granges, &c., can, if they will, materially aid in augmenting the circulation of the RURAL. Scores of such are already forming clubs; how many others will kindly do likewise?

Renew early if you would secure the uninterrupted continuance of the RURAL to your address; and pray don't forget to ask friends to join you in sending for the Fifty-three Numbers which we shall publish during 1876.

Back Numbers of this Year (from Jan. 2) can be furnished to all new subscribers, but we shall not send them hereafter unless specially requested. Those who desire can begin with any number, however.

The Best Paper, and the Best Premiums to Agents, is our motto. We ignore Chromos and all other cheap colored pictures, preferring to put our money *in the paper*, and in Premiums to Agents.

Select Your Premiums.—All persons entitled to Premiums will please designate what they prefer and notify us how and where to forward—whether by Freight or Express—if articles are not mailable.

Act as Agent!—Reader, if there is no agent for the RURAL in your locality please become one by forming a club. *It will pay.*

At Our Risk.—You can remit by Draft, P. O. Money Order or Registered Letter *at our risk.*

News of the Week.

DEATH OF HON. A. CARTER WILDER.

THE sad news comes to us that Hon. A. C. WILDER, ex-Mayor of Rochester, and formerly Member of Congress from Kansas, died in San Francisco, Dec. 22d. Mr. WILDER was born in Mendon, Mass., March 18, 1828. In 1850, he removed to Rochester, N.Y., and in 1857, to Kansas, where he was engaged in mercantile pursuits. He was in the 38th Congress from Kansas, and in 1866 returned to Rochester, where, for several years, he was engaged in newspaper publishing with his brother, Hon. D. W. WILDER, the present Auditor of Kansas. In 1872, Mr. WILDER was elected Mayor of Rochester, which position he resigned after holding it a year and a half. During the past two years his health has been poor, and, at the time of his death, he was on the Pacific Coast in hope of recovery.

HOME NEWS PARAGRAPHS.

THE court house at Camden, Ark., one of the finest in the State, was burned Dec. 19th. The books, records, and all the papers pertaining to the clerk's office were destroyed.

On Dec. 20th the Rice Grammar School, on Dartmouth St., Boston, Mass., was accidentally set on fire by the janitor while thawing a steam-pipe with a red hot poker. The flames ran up the ventilator and destroyed the upper story and a part of the second. Loss $25,000; no insurance.

Mr. Peak of West Troy, has an old chair, which was the first thing taken off the first English ship captured by the Americans during the revolutionary war. An old sailor by the name of George Lewis was the first to lay hands on it, bringing it safely on board the American ship, and it has been handed down from one generation to another, finally coming into the hands of the present owner.

Mexican traders report 300 Comanche Indian warriors at the canon of San Rodgero, 40 miles above Rimalo. It is thought that the object of the gathering is to make raids into Texas.

The Rev. Dr. S. S. Laws of New York City has been elected President of the University of the State of Missouri, to succeed President Read, whose resignation will take effect July 4, 1876.

About 2,000 tons of mown prairie grass are said to have been destroyed by fire in Brookfield, Ill., on the night of Dec. 20.

It is said that Thompson, the man who caused the Mosel horror, rented a store in South Fourth St., in Philadelphia, in 1861, and set fire to it for the purpose of obtaining insurance on fictitious stock.

P. T. Barnum is said to be making arrangements for a Centennial enterprise on a gigantic scale, but the exact nature of the venture has not yet been made public.

The harbor of Grand Haven, Mich., is to be kept open all winter by a powerful propellor which has been chartered for that purpose.

Dr. Wales M. Huntington of Pittsford, N. Y., died Dec. 19, aged 55 years. Dr. H. was born in Pittsford, and with his father, also a physician and some years deceased, had been long recognized as one of the most successful and esteemed physicians of Western New York.

Jacob Haberle and David Hastil, both young men, were drowned while skating on Bound Brook, near Sixth Avenue, Newark, N. J., on Dec. 21st. Both bodies were recovered.

The stockholders of the Citizen's Steamboat Company, Troy, have resolved to build a new Hudson River steamboat at a cost of $60,000. Already $43,000 of the stock has been subscribed for. The new boat will be wider and longer than the Sunnyside, and will be fitted up in first class style.

The receipts of the police commission of the city of Albany, for the year ended November 30, were $135,435.26, and the expenses $26,799.65 less.

The late Joel Parker's bequest to Dartmouth College provides:—First, a law department. For this object he has left property valued at from $90,000 to $150,000. This is for constituting three funds in support of the proposed law department, viz.:—An instruction, a library fund, and a building fund. Second, increase of the Dartmouth College library. Some time ago he, with his brothers established a fund called the "Parker Fund," for the benefit of the library. In his will he adds to it the sum of $12,500.

Gen. C. A. Arthur's recent reappointment and confirmation as Collector of the Port of New York seems to give great satisfaction to both press and people. It is a long time since the Government had so efficient and faithful an officer in the position, and we are glad to note the general recognition of Gen. A.'s ability and integrity.

The general inspection of the military of Pennsylvania will take place during the months of April and May, next year, instead of in the fall.

Ex-Gov. Clifford of Massachusetts is slowly recovering from his dangerous illness.

A new post of the Grand Army of the Republic at Auburn has been named after the late Secretary Seward.

Grace Greenwood's husband, Dr. Lippincott, has become Chief Clerk in the Land Office, at Washington.

The late Charles B. Winn of Woburn, Mass., bequeathed $250,000 to public purposes in that town.

Chock Wong, one of the editors of a Chinese paper at San Francisco, has declared his intention of taking out naturalization papers in the United States District Court, which will test the question of the right of Mongolians to become citizens.

Prof. F. V. Hayden, in charge of the U. S. Geographical Survey of the Territories, has been elected an honorary member of the "Circolo Geografico Italiano" of Turin, Italy.

The Trustees of Princeton College approved the Faculty's action against secret societies.

Bowdoin College develops a sentiment in favor of withdrawing from the Rowing Association.

Cincinnati proposes a public inaugural of the Centennial year.

J. W. L. Barnes, formerly Deputy Sergeant-at-Arms of the House of Representatives, has been appointed Special Agent of the Pension Bureau, *vice* Col. C. W. Seaton, who has been tendered the position of Superintendent of the Census of New York.

It is asserted that the $10,000,000 bridge over the Mississippi at St. Louis will not pay interest on cost during this generation.

Tweed is in Cuba, according to last advices, for a dispatch dated Havana, Dec. 23d, says: "A report is current that Wm. M. Tweed arrived here Dec. 17 on a schooner. Several New Yorkers who knew him by sight say they saw him yesterday and to-day in different parts of the city."

A steam street car just completed in Philadelphia will make a trial trip on Atlantic avenue, Brooklyn, in a few days. At the head of the car, which resembles inside an ordinary street car, are set three mirrors, running from top to bottom, which conceal the upright boiler from view of the passengers. On the outside is a circular inclosed platform, where the engineer is seated, so that he can conveniently feed the furnace and keep a look-out over the track ahead. At his side, in compact space, are arranged the coal-box and the necessary appliances for running the engine. All the machinery of the engine is concealed beneath the car, the pistons work noiselessly, and the car runs smoothly over the track without jarring.

The White Spring farm buildings and mansion at Geneva, N. Y., owned by James O. Sheldon, were totally destroyed by fire Dec. 24. The loss is $50,000; insurance, $26,000.

The fire at Red Oak, Iowa, Dec. 23, destroyed the entire east side of the public square. The buildings were all of wood, however, and the loss will not be more than $20,000; insured in Western companies.

Gen. Schofield, of San Francisco, has received information from Gen. Kautz, commander in Arizona, that the Mexican rebels under Gen. Sonnia, lately defeated by the national troops in Sonora, are so hard pressed that they are about to cross the border.

Speaker Kerr spends his holidays in Philadelphia.

Henry Stiles, the first white person born in Cincinnati, died at East Bay, Mich., on Wednesday.

The college catalogues for the present academic year show that Harvard has 119 instructors, Yale 86; Harvard 776 undergraduates, Yale 582; Harvard 1,278 students in all branches, and Yale 1,051. The number of students to an instructor is, in Harvard 1.07, in Yale 12.2.

FOREIGN NOTES.

At Berlin, in 1878, an exhibition will be opened with the object of showing Germans what Germans can do, and, therefore, in what points head can be made against foreign competition. The exhibition will be classified in twenty-one groups, and prizes will be awarded in medals distinguished as for production, manufacture, commerce, art, science and education. Workmen's medals will also be issued.

Many British manufacturers and other employers have lately changed pay day from Saturday to Monday for the sake of the workmen, many of whom have been in the habit of squandering their wages in dissipation on Sunday. A similar change is talked of in New England.

In the Quebec Legislative Assembly, the Government Railroad bill, the amendment to the License act increasing the cost of licenses, and the bill to prevent all conflicts between religious and civil authorities in regard to Roman Catholic cemeteries, passed their final stages on Dec. 20.

The British War Department has had the German history of the campaign of 1870-71 translated for the benefit of the service, and will treat the forthcoming Russian official story of the Crimean war in the same way.

An exhibition of manuscripts, coins, arms, implements and other objects illustrative of the history and industry of the East, will be a prominent feature of the meeting of Orientalists to be held in St. Petersburg next summer.

The Sub-Prefect of St. Omer, in France, M. Ritt, and his deputy, M. Vancossel, have been condemned to fines of 100 francs and 50 francs respectively, for giving orders to fire at a lunatic who had escaped from custody.

The Epoca says, when the Carlist insurrection is suppressed, an efficient army will be maintained in Cuba, as a measure of precaution, and that heavy guns will be placed on the coast. At the same time, Spain will propose to the United States a new and mutually advantageous treaty of commerce. Subscriptions have already been opened to defray the cost of manufacturing heavy guns for the defense of Cuba.

El Cronista, the ministerial organ, states that the Government has decided to send heavy reinforcements to Cuba.

Some sixty statuettes in clay, taken from Tanara, in Greece, by MM. Albert Dumont and F. C. Chapelain, after a long voyage in the East, have just been placed in the Gallery of Antiquities at the Louvre, Paris.

It is rumored at Cairo that the Khedive is negotiating for the sale of Egypt's founders' shares in the Suez canal. The Government of Great Britain, and M. de Lesseps, representing a combination of French capital, are the bidders. The latter has offered $9,000,000 for the shares.

It is stated that the principal feature of the Great Powers' proposition relative to reforms in Turkey is that the ambassadors of the neutral powers at Constantinople shall exercise a permanent control in the execution of the reforms in the provinces.

In the Assembly, at Paris, Dec. 23d, the Electoral Districts bill was under consideration. An amendment proposed by the Government was adopted, by which Paris will return to the Lower Chamber twenty Deputies instead of twenty-five, and Lyons six instead of eight, as at present. This reduction is effected by apportioning one Deputy to each 100,000 of population in those cities, instead of one Deputy to each arrondissement containing under 100,000 inhabitants, and two Deputies to arrondissements containing more than 100,000, as in the rest of France.

The Left are indignant over the introduction and adoption of the amendment.

A Russian paper states that emissaries from Khokand had incited the tribes subject to Russia in the neighborhood of Urapete, Turkestan, to revolt. The Russian troops attacked them, and were at first repulsed, but subsequently obtained a victory. Three hundred insurgents were killed in one engagement. The insurrection is now suppressed.

Queen Victoria has bestowed a pension of $375 per year upon each of the three younger children of the late Mr. Birch, British Resident at Perak, who was murdered by the Malays, and the eldest son will be provided with a position in the colonial service.

Ex-Empress Eugenie is much in the condition of the boy who would like to eat his cake and keep it, too. She would like to sell every bit of her laces and finery in order to give the Prince Imperial a lift in life, and at the same time she would like to retain them for the adornment of her fifty-year old charms.

All paris was in commotion at Dejazet's burial. Fifteen thousand tickets had been issued for the Trinite church, which could only accommodate one-fourth that number. The elite of the artistic and literary world were present, and the streets were thronged with 200,000 spectators. Notwithstanding the intense cold, the windows were all open, and the balconies crowded on the line of the funeral procession.

The Dutch Government will show at the Centennial Exhibition a collective model illustrating the progress made by Holland in hydraulic engineering, and consisting of groups of models of the principal great reclamation and other works undertaken by the State. Among them will be shown the Haarlem drainage, the new canal, the Dordrecht steel bridge, the Kuilenberg railway, a new steam pump, copper models of sluices, relief map of the Zuyder Zee, &c. The objects are now being shown to the public before being packed for America.

According to an official report, dated 1873, the total force of the Mexican army was then 23,311, of which the infantry absorbed 14,002, the cavalry 4,813, the artillery 1,479, the engineer corps 969, and the medical corps 148. There was also an auxiliary corps of 526 men. In addition to this national force the various States had their militia averaged at 10,000 per State. The active fighting force of the country now under arms is estimated at 50,337 men. The Minister of War, Gen. Ignacio Mejia, is General-in-Chief. There are four generals of division, ten brigadier-generals, 310 colonels and lieutenant-colonels, and 1,359 officers of lower rank.

A Portuguese gunboat has been ordered to the Island of St. Thomas, in the Gulf of Guinea, on account of an alleged insurrection of the negroes.

The French steamer Louisiana was sunk, Dec. 20, in the River Gironde, by a collision. Sixteen lives were lost.

Sir Alexander Gordon, a Conservative, has been elected a member of Parliament from East Aberdeen.

A dispatch from Halifax, N. S., says that the Committee appointed to examine the distress at Cape Breton report 1,355 persons requiring assistance in the various mining districts.

Spain has decided to send heavy reinforcements to Cuba.

The British troops in Malacca have arrived befor Kintah.

The Prince of Wales landed at Calcutta last week.

The Epoca, of Madrid, says that when the Carlist insurrection is suppressed a large army will be maintained in Cuba as a measure of precaution, and that Spain will propose to the United States a new and mutually advantageous commercial treaty.

The London Times, in its second edition, Dec. 24, has a special telegram from Penang, dated Dec. 24 to the following effect:—General Colborne reports that he has taken Kintah without any loss. The Maharajahs, Ismail and Lela fled to Palane.

The steamship Kenilworth, Captain Prouse, which left Liverpool on the 13th, and Queenstown on the following day, for Philadelphia, has returned to Queenstown, having lost her propeller.

The Lord Mayor of London has received from Mayor Stokely of Philadelphia a superbly bound volume of the latter's third annual message. The book is bound in Levant morocco, with elaborate ornamental silk linings, and is inclosed in an elegant morocco case, also lined with silk.

The British troops in Malacca have arrived before Kurtah, where the Maharajaha Island and Lela opposed them with considerable force.

The principal feature of the great powers, propositions relative to the reforms in Turkey is that the ambassadors of the neutral powers at Constantinople shall exercise a permanent control in the execution of the reforms in the provinces.

Sonora, Mexico, is in a state of anarchy, and Governor Pesquiera has levied a special tax to carry on the war.

There is in China a remarkable people known as "the nameless sect." They profess "an old religion," which prevails more or less all over China, but especially in the province of Shantung. Disliked and persecuted by the civil authorities, they have for a long time endeavored to keep their beliefs and practices secret. Their religion is said to have come from the West, whence also they expect a deliverer. They do not worship idols. At the close of their religious services they have a meal, of which bread and wine form the greater part. It is thought that they may be the remnant of the native churches planted centuries ago in China by Nestorian missionaries, who are said to have preached the gospel for nearly a thousand years through Southern and Middle Asia with marvelous energy and success, and to have exerted a powerful influence in China for upward of six hundred years, from the seventh to the thirteenth century.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Dec. 25, 1875.

THIS and the coming week will render a good deal of produce inactive, especially coarse items. The lull at this season is not unexpected, as the term between Christmas and New Year is devoted to settling up the year's accounts in many wholesale circles. Dealers in dairy products and other lines of goods not persishable do not look for trade to open until after Jan. 1. We may look for easy figures, as we have passed a prolonged season of quiet trade.

BEANS AND PEAS.—Beans are generally quoted at the late low figures, for mediums and marrows are again shaded. Pea beans quiet. Few prime are offering. White kidneys fairly firm. Red dull and favoring buyers. Peas of all kinds are quiet and unchanged: the extreme for green is $1.75.

We quote Beans, pea, new, prime, $1.75@1.80; other, 1.50@1.65; medium, new, $1.45@1.50; fair to good, $1.20@1.35; very poor, 75c.@$1; marrow, new, prime, $1.75@1.80; other, $1.55@1.65; white kidney, prime, $2.20@2.25; fair to good, $1.90@$2; red kidney, new, prime, $1.55@1.75; fair to good, $1.40@1.50; California Lima, choice, $5.50@6.50. Peas, Canadian, bbls., now, duty paid, $1.23; bulk, in bond, $1.03@1.05; green, new, ₱ bush., $1.75; Southern B. E., ₱ 2 bush. bag, $3@3.10.

BEESWAX is wanted at 31½@32c. for Western, and 32½@33c. for Southern.

BROOM CORN.—Supplies are almost entirely of poor stock, which has to be sold low.

We quote Brush, short green, 9½@10c.; hurl, green, 10c.; green, medium, 7@8c.; red and red tipped, 6@7c.

BUTTER.—There have been one or two days of pretty brisk trade since our last and quite a satisfactory movement in good lines of State at 25@28c. Marketmen are willing to pay these figures, as they can make a profit and have a standard of quality that will run even. This gives the under grades of state the preference over the irregular supplies of Western at this season. Fancy State is still strong at our quotations. Very extra dairies may be quoted a shade above 30c., but the instances are rare. Western solid-packed and rolls are in good demand, especially the cheap grades of the former, which are wanted for bakers' use. Pails and creameries might as well be dropped from the list, so few arrive. We quote:

State dairies entire, extra, 30@—c.; entire, good to prime, 26@28c.; fair to good, 24@26c.; firkins, selected fresh, 28@30c.; good to prime, 25@28c.; fair to good, 21@25c.; half-firkin tubs, selected, 30@33c.; good to prime, 26@32c.; fair to good, 27@30c.; poor to fair, 25@27c.; State, Welsh, tubs, full made, 30@33c.; dairies, 27@29c.; good to prime, 25@27c.; fair to good, 24@25c.; poor to fair, 22@23c. Pennsylvania, store packed, 17@26c.; Western, dairy tubs, selected, 26@27c.; good to prime, 24@26c.; tubs selected fresh, 26@27c.; good to prime, fresh, 24@25c.; fair to good, fresh, 21@24c.; poor to fair, fresh, 20@21c.; Western, early packed, selected, 21@22c.; Western, early packed, other, 16@20c. Roll butter, good to prime, 24@26c.; fair to good, 22@23c.

CHEESE.—Export trade is moderate, and no improvement is expected until after the holidays. Exceptional lots of fancy factories have been sold at 13¾c., and some lots are held off the market even at this price, but more general sales of ordinary fancy are at 13@13¼c. The home trade is without life.

New State factory, fancy, 13@13¾c.; fine, 12¾c.; do. good to prime, 12@12¾c.; fair to good, 10@12c.; poor to fair, 7½@10c. State Farm Dairy—fancy, 12¾@12¾c.; good to prime, 11¾@12c.; fair to good, 10@10½c. Western factory, cheddar, fine, 12@12½c.; good to prime, 11@12c.; flat time, 12½@13c.; good to prime, 11@12c.; fair, 8@11c.; poor to fair, 6@8c.

CIDER—Scarce. Quoted at 20@25c. for new pure sweet.

COTTON has declined a trifle under the heavy receipts at the ports and a dull Liverpool market. December, 13 1-16@13 3-32c.; January, 13¼@13 5-32c.; February, 13 5-16@13 11-32c.; March, 13 9-16@13 19-32c.; April, 13 13-16@13 27-32c.; May, 14@14 1-32c.; June, 14 7-32@14¼c.; July, 14¾@14 13-32c.; August, 14 7-16@13 15-32c.

Quotations for spot cotton, based on American standard of classification:

	Uplands.	*Ala.*	*Orleans.*	*Texas*

Strict ordinary	12 3-16	Middling	12 11-16

DOMESTIC DRIED FRUITS.—Apples are plenty, hard to sell; and weak as to prices. Unpeeled peaches scarce and firm. Peeled peaches dull and favoring the buyer. Blackberries inactive.

Apples—State, sliced, 10¾@10¾c.; quarters, 9½@9½c.; Western quarters, 8½c.; Southern sliced, 1875 crop, 9¾@10c. for prime, and fancy 12c.; Tennessee quarters, 8½c. Blackberries, new, 10@11c. Peeled peaches, good and prime Georgia, 14@18c.; do. fancy, 19@20c. Unpeeled peaches, new, 12½@13c. for halves, and 11½c. for quarters. Plums at 20c. Raspberries, new, 32@33c. Cherries, 24@25c.

EGGS.—There is always a steady demand for the holidays, and though the dull times produce some curtailment in the trade, dealers are satisfied with the rate at which stock goes out at prices.

Jersey and Pennsylvania, single bbls., ₱ doz., 31@32c.; State, 30@31c.; Western, prime, 29@30c.; do. fair marks, 28½@29c.; Canadian, 29½@30c.; Southern, 28@30c.; Limed, State, prime, 25@27c.; do. Western, good to prime, 24@25c.

ESSENTIAL OILS.—The remarks of the past week are still applicable.

We quote peppermint in glass "H. G." $4.25 ₱ lb. cans, ₱ lb., $1. Wintergreen, $3.25 ₱ lb.; sassafras, 65c.; spearmint, $3; pennyroyal, $2; wormwood, $1; tansy, $4.

FEATHERS are quiet at 60@63c. for prime live Western, and 35@55c for mixed.

FLOUR.—Export trade has been very light and home trade small, while supplies have been large and freely offered.

Superfine State, $4.50@4.75; extra do., $4.90@5.00; superfine Western, $4.30@4.90; extra do., $5.00@5.00; No. 2, $3.40@4.25; extra round-hoop Ohio, $5.10@5.30; trade brands do., $5.35@7.40; white wheat extras, $5.60@7.75; St. Louis, $5.50@9.00; City Mills extra, $5.10@6.75; Southern at $4.40@4.75 for superfine; $4.90@5.50 for poor to choice shipping extras; $5.60@8.75 for common to choice trade and family brands. Rye flour at $4.35@5.50.

FOREIGN DRIED FRUITS.—Layer raisins, $2.80@2.85; loose Muscatel, do., $3.00@3.25. Currants, new, 7½c. Tarragona almonds, 17½c. Sardines, 13½@14½ for quarter boxes. Valencia raisins, 10½@10½c. Turkey prunes, 6c.

FRESH FRUITS.—Apples are quiet and unchanged. The weather is favorable for handling them, but holders' views are higher than large buyers feel to be safe. Cranberries steady. California pears in good demand for prime. Hickory nuts dull, considering the stock. Grapes not wanted.

Apples.—Spitzenbergs and Baldwins, fine, $3.50@4; Greenings, ₱ @3.50; mixed, good, $2.50@2.75; do. fair, $2@2.25. Lady apples, 10@15. Pears—Choice California, ₱ box, $4@4.50. Grapes—Catawba, 3@5c.; Isabella, 2@4c. Cranberries—Jersey, choice, bush. crates, $1; good to prime, $2.62@2.87; good to choice, ₱ bbl., $8.75@9.75; Cape Cod, fancy, ₱ bbl., $9.75@10.25; Eastern, fancy, $9.75@10.25; good to prime, $8.50@9.50. Nuts—Peanuts, Virginia, $1.25@1.50; do. Wilmington, $1.65@1.75; do. Tennessee, 75c.@$1.15; Hickory nuts, $1.35@1.50.

FURS AND SKINS.—The season thus far has been a dull one. Shippers' orders for Europe are for the moment supplied. The bad results of last year have reduced the speculative inquiry. The following is the generally accepted table of prices for prime skins. After the 1st prox. it is thought that a revision will occur, and at the present outlook it will be in buyers' favor:

Bear, Northern, as to size and quality	$10 00 to 15 00
Bear, Southern and Northern yearlings	5 00 to 10 00
Beaver, Northern, per skin	2 50 to 3 50
Beaver, Western and Southern	1 50 to 2 50
Badger	20 to 50
Cat, Wild, North and East States, cased	50 to 60
Cat, Wild, Southern and Western	40 to 50
Fisher, Northern and Eastern	7 00 to 12 00
Fisher, Southern and Western	3 00 to 8 00
Fox, silver	15 00 to 50 00
Fox, Cross, Northern and Eastern, according to size and color	3 00 to 5 00
Fox, Red, Northern and Eastern, according to size and color	1 50 to 1 65
Fox, Red, S. Penn., N. J., and N. Ohio	1 25 to 1 50
Fox, Red, Southern and Western	75 to 1 00
Fox, Gray, North and Eastern, cased	75 to 1 00
Fox, Gray, South and West	40 to 60
Fox, Kitt	30 to 50
Lynx	1 00 to 2 00
Marten, Stakes	1 50 to 2 00
Mink, New York and New England	3 00 to 4 00
Mink, Can., Mich., and Minn	2 00 to 3 00
Mink, New Jersey, Pennsylvania, and Ohio	1 00 to 1 50
Mink, Maryland, Virginia, Kentucky, Indiana, Wisconsin and Iowa	75 to 1 25
Missouri and all Southern	50 to 75
Muskrat, N. and East'n, fall & winter	23 to 25
Muskrat, West, including Penn. and Ohio, winter	20 to 23
Muskrat, Southern prime winter and fall	12 to 15
Otter, North'n and Eastern and North-West	10 00 to 12 00
Otter, Penn., N. J., Ohio and Western	8 00 to 10 00
Otter, South Carolina and Georgia	2 00 to 6 00
Opossum, North. cased	18 to 20
Opossum, South and open North	12 to 15
Racoon, Mich., N. Ind., N. Ohio, Indian handled, dark	80 to 1 00
Racoon, Ill., Iowa, Wis. and Minn	50 to 65
Racoon, N. Y. and E. States & N. Penn.	65 to 75
Racoon, N. J., S. Penn., Ind., Ill., Mo., Neb. and Kan	40 to 50
Racoon, Md., Va., Ky., Tenn., N. and S. Car., Geo., Ark., Fla. and Ala	15 to 40
Rabbits, prime, cased	2 00 to 3 00
Skunks, prime black, No. 1, cased	— to 1 30
Skunks, prime black, No. 1, open	— to 1 00
Skunks, prime one-half white streak	50 to 80
Skunks, white streaked	15 to 20
Wolf Skins, mountain, large	2 00 to 3 00
Wolf Skins, prairie, prime	75 to 1 25

GRAIN.—The arrivals of wheat by rail are sufficient for present demand, and the accumulated supplies from the fall are burdensome, with prices easier. Latest sales at $1.37 for prime amber Michigan; $1.46½ for very choice amber Pennsylvania; $1.44@1.45 for white Western; $1.31½ for choice No. 1 Milwaukee spring in store; No. 2 Milwaukee spring, $1.21; $1.05 for No. 4 spring, under inspection rules; 95c. for "no grade" do., and $1@1.05 for rejected spring. Rye at 91@95c. for State, and 80@90c. for Western. Barley dull and weak; sales of two-rowed State at 85@92½c. for fair to good, and $1.12 for Canada. Corn is in larger supply and easier. Sales at 74@74½c. for sail mixed western afloat; 74½@75c. for high mixed; 73½c. for old yellow western in store; 66@68½c. for very damp to choice dry new mixed western; 87@88½c. for new yellow western. Oats selling slowly and weak at 49@51c. for white State; 45@50c. for mixed Western, and 47@51 for white do.

HAY AND STRAW.—Purchases are less general and in lighter quantities on account of the full prices asked.

Bale hay is quoted:—Shipping, 80c.; retail qualities, $1.10@1.20 for new; clover, 65@75c.; salt, 65@70c. Straw is quoted at $1.15@1.25 for long rye; 80@90c. for short rye; 65@75c. for oat.

HIGHWINES.—Sales at $1.16.

HOPS.—There is more doing on export account, and choice grades occasionally bring better prices, or up to 15c. Good and grades under difficult to sell.

New York State, 10@15c.; Eastern, 10@15c.; Wisconsins, 10@15c.; Yearlings, 8@10c.; Olds, all growths, 4@6c.; Californians, 17@20c.

HONEY.—We have seldom seen the market so quiet at this season. Supplies are still largely in first hands, and that of course means weak prices. We quote white clover, in glass, 20@25c.; buckwheat, 15@17c.; strained, 14@15c.

MILK.—The farmers' average for the month of November was 1¼c.

POULTRY AND GAME.—There has been a very fair demand for dressed poultry. There is less demand for geese than is customary for Christmas week, still prime quality and good sizes are salable. Turkeys sell briskly. We quote:

Turkeys, N. J., choice, 15@17c.; do. other, 13@14c.; State and Western, choice, 14@15c.; do. other, 12@13c. Chickens, N. J., 13@17c.; State, as to quality, 10@13c.; Western, 9@12c. Fowls range at 9@12c. Ducks, 13@14c. Geese, near-by, 13@14c.; do. other, 9@12c.

Live poultry is a little stronger, but there is no inducement for heavy supplies.

Chickens and fowls, Jersey, ₱ lb., 10@12c.; Western, ₱ lb., 9@11c. Roosters, ₱ lb., 8@9c. Turkeys, Jersey, ₱ lb., 12@13c.; Western, 9@11c. Ducks, Jersey, ₱ pair, 70@90c.; Western, 55@65c. Geese, Jersey, ₱ pair, $2@3.50; Western, $1.12@1.37.

Game is selling freely. Prices for birds are quite as good as they were last week. Venison is abundant and easier. The 15th of January is the law's limit for deer.

Quail, trapped, prime, ₱ doz., $2.00@2.25; soft, $1.25@1.50. Grouse, prime, ₱ pair, $1.10@1.20; drawn, 80@95c. Partridges, choice, ₱ pair, 80@90c.; Western, drawn, 65c.; Eastern, 65@75c. Hares, ₱ pair, 45@55c. Rabbits, ₱ pair, 40@45c. Venison, short saddles, ₱ lb., 15@16c.; long saddles, 13@14c.; whole deer, 8@10c. Bear, black, grown, ₱ lb., 10@12c.; cub, 10@12c. Canvas-back ducks, Western, ₱ pair, $1@1.25; redhead, 70@80c.; mallard, 60@70c.; teal, 40@50c.; common, 30@40c.; Havre de Grace canvas back, $1.50@1.75. Wild geese, 75c.@$1 ₱ pair; do. turkeys, 14@16c. ₱ lb.

PROVISIONS.—Mess pork lower on account of the increased arrivals of hogs at the West. Lard also easier. Bacon scarce and at full prices. The quotations are for mess pork $21 on spot, $20.65 for January and February, $20.80 for March; extra prime, $15.50@16, prime mess $19.50. Dry salted shoulders 8¼c. do.; short cut hams 11¼@12c. Bacon at 10¾c. for long clear, 11c. for long and short clear, together. Lard at 12 15-16@13c. for Western steam, spot and December, 13c. for January 13 3-16c. for February, 13 5-16c. for March. Tallow at 10@10½ for prime. Stearine at 13¼c. for prime Western. Beef hams $21.50@22.50. Beef, extra mess, $12@12.50; do., plain mess $11@11.50; new tierced at $23 for prime mess, $25 for India mess, City extra India mess, $31.50@32.50. Old extra mess, $11.50 and $10.50 for plain mess; packet, $15.50@16.50.

SALT.—Ashton's, $2.50; Deakin's, $1.60@1.65; Marshall's, Washington's and Worthington's, $1.65@1.65; Higgins & Deans', $1.75@1.80.

SEED.—Clover is scarce; selling in small lots at 12¾c. for prime Western and 13¼c. for State.

TOBACCO.—Export purchases are small and local trade without much life, as usual about the holiday period.

VEGETABLES.—The market generally unchanged. Low prices for potatoes have induced considerable demand, but the stock continues large. We quote:

Early Rose, bulk, ₱ bbl., $1.00@1.25; Peach Blows, $1.50@1.75; Prince Alberts, $1@1.25; Peerless, 65c.@$1.00. Sweet potatoes, $1@2.75. Cabbages, ₱ 100, $3@5; red, $2@4. Cauliflower, bbl., $2@5. Squash, Marrow, bbl., 40@60c.; Hubbard, $1.25@1.50. Onions, red, bbl., $1@1.50; yellow, $1.50@1.75; white, $2.50@2.75. Russia Turnips, ₱ bbl., 75c.; white, 40c. Carrots, $1.75.

WOOL.—Business is very slow, but supplies are now so reduced that prices are well sustained.

ROCHESTER, Dec. 25.—Flour market steady; spring, $6.75; amber winter, $7.00; white winter, $7.25; double extra, $7.50. Rye flour quiet at $5.50. Wheat is dull: Milwaukee club, $1.25@1.30; amber winter, $1.15@1.20; white winter, $1.20@1.30. Oats, nominal at 35@40c. Corn steady at 70@75c. Cornmeal, $1.85@2. Butter, 28@30c. Cheese, 12@13c. Eggs, 26@28c. Lard, 13@14c. Apples, ₱ bu., 50@85c. Potatoes, ₱ bu., 25@35c. Beans, ₱ bu., $1.00@1.45. Mess pork, $21@—. Wool, 30@35c. Hay, $10@15. Straw, $8@12. Timothy seed, $2.75@—; clover, $5.75@6.00. Wood, hard, ₱ cord, $8@9. Coal, $6.65@7.35 for stove.

COUNTRY CHEESE MARKET.

LITTLE FALLS, N. Y., Dec. 18, 1875.

THERE were but few sales of cheese at the Little Falls market for the week ending Dec. 25. Only about 500 boxes of factory were sold, these being all November make. From 10 to 10½c. were paid for them. Septembers and Octobers may be quoted at from 1 to 2c. higher.

On account of the bitter cold weather no farm dairy cheese came into market, and but little butter was bought. Good winter butter brought from 22 to 25c.

We have advices from Europe up to the 12th of December. Our London correspondent says:

English cheese quiet in all its branches. American, if very fancy and free from late and early made, are in better request at quotations; low-priced in demand. Quotations are as follows:

American extra, 62s@66s.; fine, 62@63s.; good, 50@60s.; secondary, 36@48s. The other descriptions of cheese sell as below:—English cheddar, 78@91s.; Wiltshire cheddar, 70@78s.; Cheshire fine, 58@68s.; fine, 76@84s.; Scotch, 70@74s., ₱ cwt.

Butter is in improved demand, though nearly confined to the finest descriptions. We quote:

Clonmels, 134@136s.; Corks, 131@150s.; Dorsets, 160s.; Jersey, 100@130s.; Friesland, 130..136s.; Normandy, 90@156s.; American and Canadian, 90@122s., ₱ cwt.

LIVE STOCK MARKETS.

NEW YORK, Dec. 25, 1875.

MILCH COWS.—The continued heavy run of poor quality fresh cows keeps trade slow at low rates. Extreme range of prices, $30@42 ₱ head for selves included. General sales, $30@35 ₱ head. Sixteen cows sold at $30@30 ₱ head; 41 do., $45@90 ₱ head; 10 do., $55@75 ₱ head; 1 springer, $81.

VEALS AND CALVES.—Coarse quality grass calves in over supply; prices obtained, on a slow trade, $3@12.50 ₱ head. Coarse quality meal-fed calves, 6@7c. Bobs, $2.50 ₱ head. Rough hair yearlings, 2½@3c. ₱ lb. Smooth quality scarce and slow of sale at 8@10½c. ₱ lb.

SHEEP AND LAMBS.—Monday trade was moderate. Sheep sold at 5@5c. ₱ lb.; lambs, culls included, 6½@6¾c. Wednesday, no change in the tone or trade. Sheep, 5@7c. ₱ lb.; lambs, 7@7¾c. Thursday, trade still uniform. Sheep, 5@7¼c.; lambs, not quoted. Friday, markets closed dull. Sheep, 5@7c.; lambs, not quoted. State sheep, 5½@6c. ₱ lb.; Wisconsin do., 6¼@7c.; Indiana do., 5½@6¾c.; Kentucky do., 5@5c.; Illinois do., 6@7c.; Canada do., 7½@8c.; Ohio do., 5@7½c.; Jersey do., 5½@6¾c.; State lambs, 7@8c.; Canada do., 7½@8c.

HOGS.—Monday trade in live hogs fair at 7¾c. ₱ lb.; Wednesday trade slow at 7½c.; Thursday and Friday none on sale. City dressed opened fair on Monday at 9½@9¾c. ₱ lb.; general sales at 9¾c.; on Wednesday trade was dull and prices fell off to 9@9½c.; Thursday, 8¾@9¾c.; Friday, 8¾@9¾c. The markets closed weak.

HORSE MARKET.—Trade in horses the past week was very slow. Nineteen poor quality light harness horses sold at $55@95 ₱ head; 81 fair do., $115@200 ₱ head; 23 roadsters, with moderate trotting action, sold at $215@275 ₱ head; 1 choice brougham horse, $300; 1 pair stylish carriage horses, $1,000; 2 pairs family do., $300@400 ₱ pair; 3 pairs heavy draft horses, choice quality, $525@600 ₱ pair; 5 head do., quality poor, $120@175 ₱ head. No arrivals reported, freight trains being held back in several instances.

SPECIAL NOTICES.

A Paper for Young People.—The YOUTH'S COMPANION of Boston is one of the most judicious and enterprising sheets in the country, and in breadth of miscellaneous reading has no superior.

MONEY IN THE GARDEN.

A Vegetable Manual, Prepared with a view to Economy and Profit.

THIS Work upon Kitchen and Market Gardening and the Field Culture of Root Crops, is by P. T. QUINN, Practical Horticulturist, (Author of "Pear Culture for Profit,") and should be owned and studied by every one interested in Gardening. It is an able, practical, profusely illustrated work of 203 12mo. pages. Sent, post-paid, for $1.50. Address

D. D. T. MOORE, Publisher, 78 Duane St., New York.

PERSONAL ITEMS.

JENNY LIND'S health is failing.

ELIZABETH THOMAS of Ripley, O., is only 105.

EDMUND C. STEDMAN has gone to Aspinwall.

PAGE is painting President Eliot of Harvard.

GEO. ELIOT'S new novel is entitled "Daniel Deronda."

NILSSON is to make a tour through England and Belgium.

MARK TWAIN, Samuel Clemens, is sick in Hartford, Conn.

ALEXANDER of Russia finishes his fifty-eighth year shortly.

GEN. JOVELLAR has been appointed Captain-General of Cuba.

THE late Horace Binney left personal property valued at $520,192.

GEN. MEIGS' daughter is the American belle at Berlin this winter.

J. A. PERKINS, a prominent lawyer of Montreal, died there, Dec. 23.

WELD is the name of a Boston man reputed to be worth $18,000,000.

THE Italian Minister, Blanc has become a Centennial Commissioner.

MOODY and Sankey had their largest audience in Philadelphia, Dec. 22.

GEN. CABALLERO DE RODAS, formerly Captain-Feneral of Cuba, is dead.

BRIGHAM YOUNG has had a severe relapse and is in a precarious condition.

GEO. S. BANGS of Fast mail fame has resigned to engage in private business

, COL. J. H. WOOD of Chicago, is said to be the possessor of a $50,000 diamond.

CONGRESSMAN WARREN of the 8th Massachusetts District is in very poor health.

G. L. RUFFIN, a colored lawyer, has been elected a Common Councilman in Boston.

H. C. WILCOX (Rep.) has been re-elected Mayor of Meriden, Conn., by 233 majority.

PETER SANDFORD, a well-known New Jersey contractor, died in Newark, recently.

WATERS & SONS of Troy, will have six paper boats on exhibition at the Centennial.

GLADSTONE is receiving daily about twice as many letters as there are in the alphabet.

MOTHER STEWART, the Crusader, is soon to leave for England to begin a work there.

THE Rev. E. B. Andrews was inaugurated President of Denison University, Ohio, Dec. 22.

EULOGIES upon Andrew Johnson will be delivered in the Senate on the 11th of January.

DR. GALLERRY, formerly of Philadelphia, has again declined the R. C. Bishopric of Hartford.

CAPT. JAMES OSTRANDER, one of Troy's oldest and most respected citizens, died Dec. 15, aged 54.

EDWIN FORREST'S old house in Philadelphia, has been sold for $93,000, and is to become a club-house.

EX-SENATOR RICHARDSON of Illinois is dangerously ill with a stroke of paralysis, at his home in Quincy.

GEN. A. H. H. DAVIS, editor of the Doylestown, Pa., Democrat, is about to publish the history of Bucks County.

SENATOR FERRY of Michigan has been re-elected President of the Senate, and is therefore acting Vice-President.

THE Attorney-General Weeks has been elected to the Nova Scotia Legislature, for Guysborough, by a majority of six.

MR. J. W. LYTLE, a large land owner in the town of Williamsburg, Ohio, was kicked to death by a high-spirited horse.

H. E. BIRD, a distinguished English chess player, is now here and won a majority of the games played with the New Yorkers.

SENATOR FENTON writes from Florida to his Albany physician that he has already been much relieved from his throat trouble.

THE report that ex-Senator Nye was recovering his health and his mental faculties proves incorrect. He is considered incurable.

DR. D. IVES, pastor of the Baptist Church at Suffolk, Conn., for the past thirty-four years, died at Conway, Dec. 22, aged 70 years.

GEN. LANE, candidate for Vice-President in 1860, is now a farmer of Oregon. His son is a Representative in Congress from the same State.

HORACE WHITE thinks Americans are better housewives and cooks than English women. Possibly the Centennial year is rousing his patriotic feelings.

CAPT. F. W. BIGELOW of Boston, who absconded some days ago with about $1,200 of the funds of the Washington Guards, has been arrested at Fitchburg.

JAMES WILSON, a New York street broker, has failed for $350,000. He leaves $1,500,000 in stocks for assets (at par value), but they are almost worthless.

DR. W. P. HAMMOND, director of the prison at the Shoals, Martin Co., Ind., resembles Tweed so closely that he has been arrested twice on suspicion of being the fugitive, and is now afraid to go out of his house.

MR. SLATES JEWELL died at Saratoga, N. Y., Dec. 17, in his 99th year. Mr. Jewell was married in the year 1800, and his wife, aged 98, still lives with the first born—a lady of 74.

MR. MOODY paid no attention to the Congressmen while in Philadelphia the other day. He probably intends soon to have religious meetings in Washington and keep at the work long enough to make an impression.

— The total debt of the State of California is $1,033,361.35.

— The Bank of Brandywine, at Westchester, Penn., has closed.

— A revival is in progress at the Methodist churches in Troy.

— The annual production of gold in the U. S. amounts to $30,000,000.

— Default has been made in the payment of the coupons of the Peruvian debt.

— The Saratoga Lake Bridge Company has declared a dividend of 25 per cent.

— Bush & Groat's boot shop in Spencer, Mass., was burned Dec. 21. Loss, $75,000.

— A church in East Saginaw organized a squirrel hunt, for the benefit of its treasury.

— Reports from San Diego, Cal., announce that all is quiet along the boundary line.

— The Pennsylvania Railroad has bought the Philadelphia Navy Yard for $1,000,000.

— The parish bar of St. Mary's Parish, La., has requested the District Judge to resign.

— The House Appropriations Committee of Congress will bring in three bills after recess.

— The Republicans are more pleased with Speaker Kerr's committees than the Democrats are.

— The office of the Advertising Journal, Kearney Township, N. J., was destroyed by fire on the 21st inst.

— China departs from the custom of other nations by sending two ministers instead of one to Washington.

— The Yale University Boat Club has voted to withdraw from the Rowing Association of American Colleges.

— The Central Vermont railroad has reduced its pay-roll about $50,000 per month within the last few months.

— The Italian expedition for exploring the interior of Africa will start in January, and be absent three years.

— The population of Seattle, Oregon, according to the census just taken, is 3,480, exclusive of Indians and Chinese.

— A gas-main exploded under the Federal street bridge, Boston, Dec. 22, killing and wounding a number of persons.

— It is said that Mr. George Martin has conveyed the Martin Opera House premises, Albany, to James Hart for $150,000.

— The rolling mill at Lebanon, Pa., of which John W. Bowman is the manager, employing 100 men, resumed work Dec. 20th.

— The Georgetown Miner says that Colorado may safely be put down for $10,000,000 in gold and silver in 1875 and $20,000,000 in 1876.

— It is stated that female searchers are to be stationed in the Dominion custom offices at both the upper and lower suspension bridges.

— A resolution has been offered in the California Legislature providing for an investigation into the trustworthiness of Pacific coasting vessels.

— The military of Savannah are making preparations to celebrate the anniversary of Gen. Robert E. Lee's birthday, Jan. 19, by a grand parade.

— The Boston Commercial Exchange has voted against appropriating $10,000 in aid of the Poughkeepsie bridge and the direct Western route project.

— The Court of Appeals of New York has decided that lager bier is intoxicating. After this warning people should be very careful about drinking it.

— No Chinese bank has failed for five hundred years. When the last failure took place the officer's heads were cut off and flung into a corner with the other assets.

— Philadelphia is the second port in the Republic, in the export trade. New York is first, San Francisco third, Boston fourth, Baltimore fifth, and New Orleans sixth.

— Practical engineers estimate the cost of the proposed free bridge over the Ohio, connecting Cincinnati with Covington, at present prices of labor and material, at $750,000.

— There are from seventy-five to a hundred thousand Chinamen in California. John flourishes anywhere, but seems to have a slight fancy for the immediate vicinity of gold mines.

— The religious revival at Port Jervis, N. Y., closed Dec. 19. The number of conversions in the Methodist Church are over 700. The converts in the other churches will probably make 800.

— Statistics show that from 1853 to 1871, wages in France went up more than 40 per cent.; while of the masters 80 per cent. were originally workmen, and 15 per cent. the sons of workmen.

— The Legislature of California has enacted a law which allows every citizen who will plant trees and maintain them for three years, a deduction from his taxes of $1 for each tree so planted.

— Nevada has passed a law forbidding any person practising as a physician in that State who has not practised medicine there for five years, or does not hold a diploma from an established medical college.

— Italy will be well represented at the Centennial exhibition. The committee in charge of the matter have received 600 applications for space in the Italian department. Most of the exhibitors will send works of art.

Dairy Salt.

THE AMERICAN DAIRY SALT COMPANY

J. W. BARKER, Pres't and Sec'y. THOMAS MOLLOY, Treasurer.

General Office, No. 1 Clinton Block, Syracuse, N.Y.

Sole Manufacturers of the Celebrated Onondaga Factory Filled

DAIRY AND TABLE SALT.

Respectfully call the attention of Dairymen and others to the quality of Salt now being manufactured by them.

Having for many years past been engaged in perfecting the various processes for the manufacture of this salt, and by adopting the best modes and machinery for the purpose, they feel warranted in saying to the consumer that the article now produced is superior to any other, either of foreign or domestic production. The following is an analysis of our salt and the Ashton, made in April, 1875, by Messrs. Waltz and Stillman, Chemists, of New York, under the direction of a Committee of the Butter and Cheese Exchange of New York, the samples being selected by the Committee from lots found on sale in market:

	Ashton.	Onondaga.
Water	0.7889	0.6280
Insoluble Matter	0.0501	0.0304
Sulphate of Lime	1.2272	0.7217
Sulphate of Magnesia	0.0769	.....
Chloride of Calcium	.....	0.0473
Chloride of Magnesium	0.0591	0.0316
Chloride of Sodium	97.7538	98.5213
	99.9674	99.9823

Circulars in regard to the various other tests made with this salt in comparison with the best foreign article, also certificates from a large number of the best dairies in the State as to its quality, may be had on application to J. W. BARKER, Secretary, Syracuse, N. Y., to whom orders for salt may also be addressed. It is also for sale by the Agents of the Company in principal Western Lake Ports; by ST. JOHN & AVERY, 110 and 108 Broad St., New York; ROBERT GEER, 105 Pier, Albany, N. Y.; E. W. PECK & CO., Burlington, Vt., and by dealers generally throughout the State of New York.

Inquire for ONONDAGA FACTORY FILLED SALT.

Real Estate.

Cheese Factory FOR SALE.—The Cheese Factory located at the center of Huntsbury, known as Bodman & Wright's Butter and Cheese Manufactory, will be sold on reasonable terms. This Factory is situated in one of the best locations on the Western Reserve, being only three miles from Railroad Depot and surrounded by a first-class dairy country, and having been long established, liberally patronized and successfully operated, receiving and manufacturing the milk from 700 to 1,000 cows. The health of Mr. Wright and the official duties of Mr. Bodman are the only reasons for its being offered for sale. The buildings and fixtures are all in good repair. For full particulars as to terms, &c., call on or address S. E. BODMAN, County Treasurer, Chardon, Geauga Co., O.

Send for Free Catalogue and Maps of FARMS in Maryland and Delaware. J. F. MASCHA, Smyrna, Delaware.

New Publications.

"The Household Magazine of America."

ARTHUR'S ILLUSTRATED HOME MAGAZINE.

1876.

The Home Magazine is not the rival of any other magazine, but stands alone in its peculiar sphere, character and work, and addresses itself to men and women of taste, culture and common sense; to those who have right purposes in life, and an interest in humanity. It goes into the homes of the people as a companion and friend, interested in all that interests them, and ready to help, instruct, amuse and delight every one, from the youngest to the oldest. It is recognized as

THE HOUSEHOLD MAGAZINE OF AMERICA,

and takes literary rank with the best periodicals of the country. During the coming *Centennial Year*, it will be richer and more attractive than ever in all of its varied departments.

EAGLESCLIFFE, a new Serial Story, by Mrs. JULIA C. R. DORR, author of "Sybil Huntington," will be commenced in the January number.

MIRIAM, AND THE LIFE SHE LAID DOWN, a new serial Story by T. S. ARTHUR, will also be commenced in the January number.

THE STORY-TELLER. This department will contain, besides the above, a large number of shorter stories from some of our best writers.

WOMAN'S WORK in the WORLD. A series of papers by Mrs. E. B. DUFFEY, of unusual interest and value.

"PIPSEY POTTS." The inimitable will continue her wise, quaint, charming talks on home and social topics, to the delight of all.

OLD HEARTH STONES, AND THE TALES THEY TOLD. By ROSELLA RICE. These reminiscences of Pioneer life will be very attractive.

BIOGRAPHY, History, Poetry, Stories and Sketches of Home life and character, and all that goes to make up a first-class magazine for the people, are included in the literary attractions of the HOME MAGAZINE.

BUTTERICK'S newest patterns for ladies' and children's dresses are given in every number.

Terms: $2.50 a Year. 3 copies for $6.50; 6 copies and one to getter up of club, $13; *postage free. Specimen numbers 10 cents*, in currency or P. O. stamps. As the Home Magazine circulates largely in all parts of the United States, *it offers one of the best general Advertising Mediums in the country. Dealers supplied by American News Co.*

WILLARD'S Practical Dairy Husbandry.

A Complete Treatise on Dairy Farms and Farming, Dairy Stock and Stock Feeding, Milk, its Management and Manufacture into Butter and Cheese, History and Mode of Organization of Butter and Cheese Factories, Dairy Utensils, Etc., Etc.

BY X. A. WILLARD, A. M.,

Dairy Husbandry Editor of Moore's Rural New-Yorker, Lecturer in Cornell University, Maine Agricultural College, Etc., Etc.

THIS is the most full, practical and reliable work on Dairy Husbandry extant; indeed the only one which describes the recent great improvements in the Dairy Business. It is highly commended by leading Agricultural and other influential journals, and must speedily become (in fact is already) the *Standard and Only Authority.* It will pay every one engaged in any branch of dairy business, or who keeps a single cow, to obtain and study this work.

D. D. T. MOORE, Publisher, 78 Duane St., New York.

BUY WILLARD'S **PRACTICAL BUTTER BOOK.** Now Ready. Price $1. Address MOORE'S RURAL NEW-YORKER, 78 Duane St., New York.

MOORE'S RURAL NEW-YORKER became a household word and power in the land long before we quit "going to school," and, perhaps, needs no comment from us; still "Its memory is ever fresh and green," and is renewed by its appearance every week, brimful of *good things* as ever. We are glad to announce that our predictions in the January number are being more than fulfilled. We have sent it more than *five hundred* names, and we learn that subscriptions have been pouring in in like proportions from all parts of the country, despite the hard times. Long may it continue to be what it is—a power for good in the land.—*Agent's Friend.*

MOORE'S RURAL NEW-YORKER is one of the readable, useful, family papers, equally in demand by the lady in her conservatory, the matron with her household, the farmer in his field, the stock raiser among his animals, and the young folks around the evening lamp.—*Laws of Life.*

Wit and Humor.

SPARKS AND SPLINTERS.

A TIE game—Getting married.

To what age do hogs attain?—Saus-age.

THE man who would like to see you—the blind man.

It makes a hen tender to lay a while after she is dead.

A MAN born without feet must necessarily be no-to-rious.

"You may tread on me for $4." Placard on a pair of boots.

WHY is a solar eclipse like a woman whipping her boy? Because its a hiding of the sun.

THE man who undertook to walk against time has given up, but time is still going ahead.

WEAK men are the hardest to control. They have no more backbone than an angleworm.

AN odd marriage is reported in Bland County, Va.—that of Mr. Allen Hannah to Miss Hannah Allen.

ISN'T it rather strange that one of the healthiest States in the Union should be named Chelera-do?

THE chap who is quoted as being "as honest as the day is long" had better take a back seat until next sprlug.

WHY must the letter "D" be the most wonderful letter in the alphabet? Because it is the center of "wonder."

BARTLETT is homely, while his two daughters are the opposite, and the boys have named them the Improved Bartlett pair.

THE following toast was given recently: "The ladies!—may we kiss the girls we please, and please the girls we kiss!"

HONESTY and happiness seem to be alike in this particular—those who have the most of either seem to make the least of it.

"MARY CHEESE is in the St. Louis jail." How are the mitey fallen! But perhaps her arrest was "smear-kase" or mistaken identity.

A SCHOOLBOY'S composition on the ox:—"An ox does not taste so good as an oyster, but it can draw a bigger load and run twice as fast.

A WESTERN paper says:—"We are publishing a tri-weekly now. We get out a paper one week and try like blazes to get it out the next."

THE Chinese have a saying that an unlucky word drooped from the tongue cannot be brought back again by a coach and six horses.

"A FARMER" advises strangers who wish to get teeth inserted gratis, to go and steal his fruit, when they will find his watch dog on guard.

BOY, when you slide on the long banister, of the front hall stairs, and go down to the bottom so fast that it burns you clean through your trowsers, that's friction.

A MOUNT BETHEL township farmer cut open an old hornet's nest, just to examine the inside arrangement. He says he thinks he will be able to see his barn in about two weeks.

A YOUNG man who went about Monday morning snuffing and blowing his nose, explained to a friend that "She didn't have ady fire id de parlor Suddy dight ad id dwas blabe code."

CHARIVARI tells of a negro named Domingo, in one of the French colonies, who, speaking of the advantages of the Christian religion, said: There was a time when I knew nothing of God or the devil, but now I know and love them both."

IT is of these holiday times that the poet speaks:

"The Turk awoke;
That bright dream was his last!"

The word "Turk" being, of course, poetic license for turkey.

THE other day a would-be fashionable lady called at a neighbor's at what she thought would be supper-time. "Come in," said the neighbor; "we are having a tableau." "I'm so glad," said the visitor; "I thought I smelt them, and I like them better than anything for supper.

DURING a recent examination of a class of youngsters in one of the Chemung county schools, the teacher asked:—"What is monarchy?" and was immediately answered by a bright little boy:—"A country governed by a king." "Who would rule if the king should die?" "The queen." "And if the queen should die, who would be the ruler?" "The jack."

"How is your beef?" asked one gentleman of another while dining in a cheap restaurant. "Bully," was the somewhat equivocal reply. By the way, is not the word "restaurant" of Latin origin, derived from "res," a thing, and "taurus," a bull? The explanation is at least as plausible as that the student gave when requested to define "Virgin." "It comes from 'vir,' a man, and 'gin,' a trap,' and means man-trap," answered the student.

Consumers Importing Tea Co.,
No. 8 Church Street.
P. O. Box 5,509. New York City.

This is a combination of capitalists to supply the consumers of Teas throughout the United States on the mutual principle.

We have experienced agents in all the best districts of China and Japan to select Teas especially for our trade.

We expect every consumer of Teas to render us all the assistance they can in carrying out our enterprise, as we make a specialty of SUPPLYING CONSUMERS ONLY (and allow no middlemen to make any profit on our importations), which will enable us to supply them with Teas at prices lower than have ever been known, and of those fine qualities that seldom reach the interior, being sold only to the large cities and among the very wealthy.

Hoping the consumer will take an interest in our enterprise, and send at once for a circular with full explanations of how to proceed to obtain our goods, we remain,

Most respectfully yours,

Consumers Importing Tea Co.,
No. 8 Church St.,
P. O. Box 5,509. New York City.

Entered, according to Act of Congress, in January, 1876, by the Consumers Importing Tea Co., in the Office of the Librarian of Congress, Washington, D.C.

RURAL AND HOME AFFAIRS. ARTS, SCIENCE, LITERATURE, NEWS, MARKETS, ETC.

VOL. XXXIII. No. 2. WHOLE No. 1354. NEW YORK, AND ROCHESTER, N. Y., JAN. 8, 1876. PRICE SIX CENTS. $2.65 PER YEAR.

[Entered according to Act of Congress, in the year 1875, by the Rural Publishing Company, in the office of the Librarian of Congress at Washington.]

The Herdsman.

ENGLISH PRIZE ANIMALS.

RURAL readers will be interested in the accompanying engravings and descriptions of the heads and shoulders of six notable prize-winners at the recent (seventy-eighth) Annual Show of the Smithfield Club, the most famous live stock association in England. The Show was one of the best ever made by the Club. A London contemporary, in speaking of the Exhibition, says: "Taken altogether, every one of the 395 entries is a sample of what can be done by a judicious selection of breeding and crossing various strains of blood, so as to produce the most beef, mutton and pork for public consumption." The aggregate value of the prizes was over £3,000, and among the prominent exhibitors were the Queen and Prince of Wales. The prize animals portrayed in our illustration are briefly described as follows:

1. Mr. WM. FOX BEAVEN'S of Woodborough, Marlborough, Wilts, 3 years 9 months, Emma, bred by exhibitor, sire Master Arthur 29,311, dam Emma, sire of dam Ben Bolt 21,267; fed on hay, roots, cabbage, linseed cake, wheat and bean meal, and Thorley's food.

2. Mr. ALLAN BENJAFIELD'S of The Poplars, Stalbridge, Blandford, Dorsetshire, 29 months 19 days, black improved Dorset, bred by exhibitor; fed on barley, peas, whey and Thorley's food.

3. His Royal Highness the Prince of Wales, K. G., Sandrigham, King's Lynn, Norfolk, Highland steer, about 5 years, breeder unknown; fed on oil cake, meal, roots and hay.

4. WILLIAM WOOD of Ifield Court, Crawley, Sussex, 4th Dark, 4 years 9 months, bred by exhibitor, dam 3d Dark 882, sire of dam Harry 55; fed on hay, linseed cake, bean and wheat meal; had one calf.

5. Mr. THOMAS WILLIS' of Manor House, Carperby, Bedale, Yorkshire, Bride of Windsor, Short-Horn, 4 years 7 months, bred by exhibitor, sire Windsor Fitz-Windsor 25,158, dam Blushing Bride, sire of dam Fitzclarence 1452; fed on hay, turnips, swedes, cake and meal.

6. GEORGE STREET'S of Maulden, Ampthill, Bedford, fat wether, about 21 months, bred by exhibitor, from the stocks of CHARLES HOWARD and his own.

THE SHORT-HORN MANIA.

THE breeding of fine cattle, horses or sheep is calculated to do an immense deal of good, but, beyond a reasonable price, the running up to such extraordinary and ruinous rates is certain to end in disappointment. Any one who doubts the collapse of this inflated excitement need only look back at former follies, as, for instance, the Cochin China mania among fowls in England, about twenty years ago, and the extravagant prices of fine wooled sheep in this country since then.

The fact of the Duchess family changing owners so often, and the sellers not being enriched by the thousands obtained sufficient to enable or induce them to keep on breeding, looks suspicious. Why did Messrs. THORNE, SHELDON, CAMPBELL and MORRIS all sell out after such short ownership? Whatever the cause, the celebrity of the breed, in consequence of the high prices, has spread the other strains of the breed together with the Princess and Oxford blood all over the Continent, which eventually will cause a deal of mixture among the grades, thus improving the general stock everywhere, and though the fashionable breeders may come to repentance good will arise to the great community at large.

1. Mr. W. F. Beavon's Short-Horn, "Emma."
2. H.R.H. the Prince of Wales's Highland Steer.
3. Mr. Thomas Willis's Short-Horn, "Pride of Windsor." (Champion Cup).

HEADS OF PRIZE WINNERS AT THE RECENT SMITHFIELD SHOW, ENGLAND.

It is time a breed was brought prominently forward, which not only produces rich milk, like the Jerseys, but which are good established milkers, giving a great quantity, too. When I was a boy the Alderney cows, as they were then called, gave more as well as better milk than any other breed; but beauty in figure and style, and points, are thought more of than the capacious udders they were formerly famed for, for they could not walk much faster than a turtle could crawl along, as they had to throw their legs around the great, wide and deep bag every step they took. It is admitted the cows of that day were very plain, and were a frame of little more than bones; but, as every breed has been bred with an eye to beef and fine form, by attention to milking qualities there would be no necessity to sacrifice beauty in shape, though, as a matter of course, when a cow gives a great deal of rich milk she must be bare of flesh. The Short-Horn is a fine breed. It is at the head of all the breeds, but in a few years it is probable the polled cattle of some of the long-established kinds will become general favorites on account of the absence of those dangerous appendages—horns.

Within a few years there will be a great deal of live stock sent to England, and it is presumed the hornless cattle will be much handier to move about in cars or ships; but so long as horns are tolerated, the Short-Horns and Herefords will stand first for beef. If gentlemen, who are rich enough to give from $20,000 to $30,000 each for cows, would go into raising meat for exportation, it would do more good to the country and to themselves. A WORKING FARMER.

CHARCOAL FOR SICK ANIMALS.

NEARLY all sick animals become so by improper feeding in the first place. Nine cases out of ten the digestion is wrong. Charcoal is the most efficient and rapid corrective. It will cure a majority of cases, if properly administrated. An example of its uses. The hired man came in with the intelligence that one of the finest cows was very sick, and a kind neighbor proposed the usual drugs and poisons. The owner being ill and unable to examine the cow, concluded that the trouble came from overeating, and ordered a teaspoonful of pulverized charcoal to be given in water. It was mixed, placed in a junk bottle, the head turned upward, and the water turned downward. In five minutes improvement was visible, and in a few hours the animal was in the pasture quietly grazing. Another instance of equal success occurred with a young heifer which had become badly bloated by eating green apples after a hard wind. The bloat was so severe that the sides were as hard as a barrel. The old remedy, saleratus, was tried for correcting the acidity. But the attempt to put it down always caused coughing, and it did little good. Half a teacupful of fresh powered charcoal was given. In six hours all appearance of the bloat had gone, and the heifer was well.

Farm Economy.

PROFITABLE WINTER FARMING.

THE great drawback on successful Northern farming lies in the fact, that, for six months in the year, nature is at a stand still. There is no production and consumption goes on with accelerating ratio. Years ago, we used to hear an old song which strongly illustrates the disadvantage of farming in the older States. It is the argument of the farmer with his wife to persuade her to "go West."

"For here we must labor each day in the field,
And the winter consumes all the summer doth yield."

When the country was new, there was no lack of labor for the farmer in even the coldest weather. Clearing the land of trees and stumps and preparing for next season's operations, furnished abundant, and most profitable employment. Though the compensation was small, there was never lack of something to do. Small earnings induced economy, and naturally resulted in prosperity if not wealth. Of late years all this is changed. Farmers in winter find very little to do, and it usually costs any man more to live idly than when employed. The problem of the time is to find some constant and profitable employment for farmers during the winter season, and a confessedly hard problem it must be conceded, when thousands of farmers fail to make money even in the growing season. Yet we believe it can be done, and is done by thousands of farmers in the feeding and fattening of stock. Where animals are merely kept in "store" condition through the winter, there is certainly no profit but an almost entire loss. The animal may be worth a trifle more in spring than in fall; but unless there is a positive gain in milk, wool, growth or fat, there is slender chance for profit. The wisest economy in feed, with warm shelter is also needed to make liberal feeding profitable, and herein is the advantage of large operations. It does not cost ten times as much to feed ten cows as it does to feed one, nor twice as much to care for fifty head of cattle as for twenty-five. With large buildings suitably arranged food may be cut and steamed, while the expense is entirely too great for small operations. This does not necessarily imply large farms, though these large feeding establishments will generally go with them, and the feed used be grown on the farm. The only successful winter feeding which we believe in is that wherein grain and hay consumed on the farm brings as much profit as if sold, and if this is so, excepting the cost of transportation, there is as much profit in feeding bought grain as that grown on the farm. Where large winter feeding is practiced on a small farm the tendency will be to grow roots, and possibly grain at home, buying the corn needed, and also such other grain feed as may be thought best. This is the method wisely pursued by some Eastern farmers who have found by experience that they cannot grow corn as cheaply as Western farmers will lay it at their doors. This heavy feeding and buying of corn, bran, or other feed rapidly increases the fertility of the farm, enabling it to produce more and more. This is one secret of the success of JOHN JOHNSTON as a farmer. For many years he fattened sheep every winter, and never but once did he fail to receive a profit on the corn and other feed consumed besides the large amount of valuable manure. The richness of Mr. JOHNSTON'S farm, rivaling the best-managed farms of England, is doubtless due to this management. Other farmers of our acquaintance make a good thing every winter fattening cattle, and others still by keeping cows and selling the milk. It is a fact that by skillful management and wise selection of stock, farmers can, and do make more money in winter than they do by their summer operations. This is what we call superior farming, and those who would rival it must learn to adopt similar methods, making no season of the year barren of profit, but each continuously productive.

MANURIAL IRRIGATION.

MY experience is so directly opposed to the conclusions of the writer of the article in the late RURAL—headed "Liquid Manuring not Practicable"—that I am obliged to say, that in one instance he is mistaken, for by experience, I know it to be, not only practicable, but highly profitable. This instance however, may be the one exception to the general rule. And yet I believe there are thousands of acres of land in the State of New York that might receive manurial irrigation with little more expense than has been incurred in this instance. I now have in mind several barns so located that the liquid manure from the stables could be delivered with nearly the convenience that the same material is taken from my stable to the level land below. If it could be delivered on but one acre of land, with good natural or artificial drainage—increased crops would pay a ten-fold profit over the expense the first year. Lest the opponents to hydropathic farming should get impatient, let me assure them here that I have neither tank, water-cart nor pump, and that the solid manure from my stable is applied to the land without being washed.

When I came into possession of the farm, the barn was sheltering, instead of cattle, eight or nine large rocks which served as foundation and held the building just high enough from the ground to afford a delightful retreat for stray dogs, cats, rats, skunks &c. Now instead of the rocks and vermin aforesaid, it shelters a dozen head of sleek cattle and beets and mangolds enough to feed them through the winter. If space would permit, and I could be allowed to digress far enough to tell how cheaply these comfortable quarters were built by farm hands, when other work was not pressing, and how my premises were graded by dirt drawn from under the barn in a manner that fully compensated for the labor bestowed in making the improvement. I might be rewarded by learning that some one else had been induced to go and do likewise. For the present, let it suffice that the cattle are in the stable, comfortably resting on a clay platform, held to its place by a 5x6 inch timber, behind which is a trough which receives the droppings from the cattle and the liquid manure. The latter is conducted out, and away from the stable, by a drain in the clay soil. Being compelled to suspend work a few days on the drain, the liquid ran out of the terminus and found its way to a thrifty honey locust hedge, killing it the same day it reached it, as effectually as though it had been boiling water or fire. By this I was taught how largely the article needed diluting before applying to the soil. A few rods further on, across the highway, a basin was dug in a fortunately located clay bed, into which the drain was terminated and the next morning I was the happy owner of two barrels of liquid manure. An elevated water course enabled me to run a stream of water into the basin, and from this a cheaply constructed ditch carries this dilution on to the highest part of a twelve acre lot; from thence it is made to flow to any desired place. The spout from the water course is constructed with a gate which is opened only for the purpose of spreading the liquid manure or for irrigating the land. The field having a good natural drainage never gets too wet.

Manurial irrigation has not been extended beyond the garden. Another year I shall be able to take it over the twelve acres. On most of the twelve acres for two years I have tried clear water irrigation, and have doubled the yield of grass. In the garden, I obtained a growth of beets, mangolds, corn, cucumbers, water melons, citron and squash, four times as great as on the same kind of land without the liquid application. The whole cost of this convenience does not exceed fifteen dollars. In this respect I am fortunately located. A few farmers may be similarly situated, and many may be able by artificial ponds or cisterns to wash their stable liquor on to an acre or more of land, which if kept moist through the season, will produce from two to three thousand bushels of beets, enough to feed a dozen or more head of cattle during the six months of the year that they are away from grass. S. A. M.

THERE are exceptions to all rules, and our correspondent correctly classifies the above experience as one of them. The manurial irrigation which does not pay even in England where labor is cheap, is that which demands carts and horses and drivers and laborious distribution. Wherever nature and natural forces can be made to do this work, or any other, skillful farmers will utilize them for that purpose. A great many fields are naturally irrigated and manured by the overflow of rivers in early spring. Wherever this process can be cheaply extended it should be done by all means. We think, however, it is expecting too much from an ordinary stream to have it irrigate and fertilize a twelve acre lot. —[EDS.

EFFECTS OF FROST.

T. J. EDGE, Chester Co., Penn., writes as follows in the Country Gentleman:—Many of my readers have no doubt noted the unequal effects of late spring or early fall frosts. In some cases the crop in one field suffers more than in another. A few hills here and there in a corn field are killed to the ground, or in some cases one stalk in a hill is killed and the others escape. Hoar or white frost is essentially frozen dew, and any cause which would increase the deposit of dew, would also increase the amount of frost, and hence of damage. We know that the deposit of dew is influenced by a variety of local circumstances. Two similar soils, one compact and the other made loose by mechanical means, will show a very material difference in the amount of dew. The greater the difference in temperature between the soil and the air, the greater will be the deposit of dew. Usually, low and moist situations increase the amount of dew. Spots, which from local causes, may be protected from the wind, will receive the most dew, and all these causes have probably an equal effect upon the amount of frost, and hence on the extent of the damage.

It is equally true that plants of the same kind show very different results after exposure to frost. After we carefully examine these effects, I think we will conclude that they are owing, mostly, not to any different degree of frost, or of constitutional vigor in the plant, but to the manner in which the frost is removed from the plant. If two tomato plants are exposed to equal degrees of white frost, and if before sunrise one of them is protected by two strips of board on the south and east sides, the chances are that it will not suffer at all, or at least not to the same degree as the one not so protected. Any plan by which the frost can be removed without producing too great an increase in the temperature of the plant, will be effectual. Dashing with cold water, thawing in the shade, or covering with earth, all produce similiar results in similar ways.

It is also evident that local causes have much to do in influencing the effect of severe cold upon plants. Half-hardy plants, having a southern or southeastern exposure, often suffer worse during winters of unusual severity, than plants of the same kind with a northern or northwestern exposure. This is probably due to the fact that in the first case the plant has no protection from the rising sun, whose rays strike the plant and produce that sudden change of temperature which proves so injurious. In the second case, the safety is due to the reverse state of affairs. The plant is in some measure protected by its position from this sudden change of temperature, and does not attain the same degree of warmth until its surroundings have also been warmed.

Last winter was unusually productive of "winter-killed" raspberries and grapevines, and this has been charged to the low temperature which several times prevailed. Raspberry plants with an inch or two of earth on them came out safe, while others close by (not so protected) died, But did this slight covering of earth prevent the low temperature? It is probable that in this case these plants had to withstand quite as great a degree of cold as those not protected. Is it not very likely that the damage known as "winter-killing" often proceeds from evaporation rather than from a low temperature? During the whole winter, moisture is evaporated or given off by the stalks and branches, but if from any cause this evaporation or loss exceeds the supply, the plant dries up and death ensues. During much of last winter a high wind increased the evaporation or loss, while a hard frozen soil diminished the supply. I think a few years of observation will convince my readers that windy weather, when accompanied by a frozen soil, is quite as productive of winter-killing as low temperature.

The Apiarian.

SWEETS FOR THE SWEET.

WE have to get our honey in the old fashioned way by smoking out the bees, for they hived so fast and so many that there could hardly be found boxes and kegs enough to put them in. So this fall some of the poor things had to die, for they would not allow us to rifle their treasures unmolested. Such a time as we had! I stuck sweetly to every door all morning, and clung tenaciously to the chair back. But we finished at last, and MAY carried the full crocks to the cellar there to await, "a few nice buckwheats hot from the griddle."

Then I began to look around for the children. The day was a golden October. Sunshine glimmered through the crimson and yellow maples; sunshine glistened the late autumn flowers as if for a parting benediction and shimmered along the piles of yellow pumpkins that lay ready to be housed in the garden. A yellow butterfly glanced by as I started on the search, or saw my yellow-haired laddie, wee NORMAN, getting his share of sunshine and honeycomb. For in his hand he held a lump like amber, transluscent and beautiful, but over his head in threatening attitude were three or four angry bees. He cried lustly, but continued eating, and finished his prize in the face of his assailants. WILL and JAMIE the Arabs of the family, each had a hive to scrape, and seemed to me enjoying the sum of all human happiness as they sat seesawing on the truck with big mouthsfull of luscious honey.

"Poor bees," we said, and STANTON, who is our bee man and looks after the hiving, was very regretful, though very fond of the sweets. He propounded SAMSON'S riddle as he sat with his honey poised in the center of a large beef bone from which we had cut the meat. And the glorious day, the mild Indian summer air, the content of a finished season was pleasant to our soils, and we said, "Even this cold climate is sometimes a land of milk and honey."

ANNIE L. JACK.

HOW TO SECURE PREMIUM HONEY.

DR. P. A. BAKER in the Beekeeper's Magazine publishes a plan to secure the largest quantity and the best honey which is well worthy of trial.

The plan is simply to keep a very strong colony queenless during the period of the greatest flow of honey. All apiarians know that a virgin swarm will work with more energy in building comb and storing honey, than one with a full supply. It is not uncommon for strong families, with everything needful for storing honey in surplus boxes, to loaf about the hive, until a few empty frames are given between the full ones, when they will soon be filled, but, being in the queen's chamber, she immediately performs her maternal duty and you get no honey. The law is immutable, in their allowing no empty space between brood combs, and the law impelling the bees to fill the space with comb, acts with like force in indicating to the queen her duty. By virtue of cause and effect, if the entire hive is made into space, it is but fulfilling that law for the bees to promptly fill it with comb and honey, if per chance, it is in abundant supply, but madam queen being present, we must allow a considerable force to assist in attentions to her royalty; dethrone her and supply the colony with material to make a new one, and yet allow none to mature for a period, and we shall have our boxes filled with the beauteous nectar. The operation is to put two large swarms, without queens or comb, into a hive filled with empty sectional frames or honey boxes, and give one brood comb at one end of the hive, and before the new queen is hatched, remove the comb and give them another. When the second has become fertile, the greatest flow of honey being over remove the honey frames or boxes and fill the hive with combs or empty frames as the fall season for honey may indicate. The queens and brood combs can be utilized to advantage, which any intelligent apiarian will understand.

Dairy Husbandry.

ADULTERATION IN DAIRY GOODS.

THE Boston Cultivator quotes from an article in the RURAL in which a process is given for detecting adulterated butter, and it says: "Will this test enable one to detect oleomargarine in cheese, Prof. WILLARD? If butter may be thus adulterated why may not cheese? Do not oleomargarine butter and cheese belong to the same class of adulterated goods when put into the market as they are, it seems, as whole-milk or cream goods? Then is it not clear that all such traffic is fraudulent? What says our contemporary?"

No, friend WETHERELL: the test referred to was not designed for detecting oleomargarine in cheese, and we most emphatically say that oleomargarine butter does not belong to the same class of goods as oleomargarine cheese, because the former is an adulteration and the latter is not. What is adulteration? WEBSTER defines the verb "Adulterate—to corrupt, debase, or make impure by an admixture of *baser materials;* as to adulterate liquors or the coin of a country." The popular understanding of adulteration is not to make an article better, but to make it *worse* by adding a foreign mixture. If copper coin is alloyed with silver or gold and passed as copper, it would not in a popular sense be considered adulteration, because it was made of more value than it was before the gold was added. Just so with the skimmed milk. If made into skimmed cheese without the addition of oleomargarine, an inferior and often an unpalatable food is produced. By the addition of oleomargarine a far bettes product is made and one that is palatable. The oleomargarine costs more per pound than the pound of oleomargarine cheese will sell for in the market. When oleomargarine is added to butter it is justly an adulteration to be condemned because a baser metal is used—one that does not cost so much by the pound as that asked for the oleomargarine butter. In other words, it is sold for genuine butter and the buyer is deceived and cheated with the addition of the baser material. But suppose genuine butter could be improved and made more palatable by the admixture of a healthful substance that costs much more than the same weight of butter—would it be considered an adulteration or fraud? Let us suppose a parallel case:—Take for instance winter butter, made from milk of cows fed exclusively on hay. Such butter lacks the flavor and delicious aroma of pure butter made when the cows are feeding from the rich, nutritious herbage of old pastures. Now if the butter maker could be furnished with a small quantity of those volatile oils which are supposed to give to grass butter its delicious aroma and high flavor, and if he added them to his hay-made butter making it, in all respects, equal to June butter, would that addition be considered in a popular sense as adulteration? The flavoring oils would of course be expensive and worth much more than the butter; yet if the consumer got more value in the goods and at the same time a more palatable article, would he consider it a fraud?

A fraud, as we understand it, is a deception, an artifice by which the right or interest of another is *injured*. If a person should represent that he had nice, palatable cheese, and a customer selected one recommended and it proved to be poor and unpalatable—the seller knowing the fact—that would be a fraud; but if the cheese proved delicious and in every way suited to the taste of the customer, we can see no fraud, even though it be made by the addition of oleomargarine. Rennet and salt are used in the manufacture of cheese; but if some other substances could be used, equally harmless, that would be an improvement and make the cheese better and more palatable, would that be an adulteration or fraud?

Some have claimed that it is a fraud to make skimmed milk cheese; but why is it not as legitimate as the making of whole-milk cheese? Skim cheese has been made from time immemorial, and immense quantities are used in England. Most of the Dutch cheese imported into England is skimmed cheese and it is quoted in London not unfrequently at a higher rate than extra fine American whole-milk cheese. On October 25, Edams—a skim Dutch cheese—was quoted at 64s. to 65s. per cwt., while the very *best American* sold for only 65s. to 67s. Cheese is a manufactured food, and what our cheese makers are trying to do is to make it so that it will best suit the palates of consumers; but why insist that the cream shall be used if it can be made in other ways so as to be palatable and equally as healthful.

It is useless to talk about stopping the make of skimmed milk cheese; it always has been made and always will be made; but if it can be improved in a legitimate way, why not favor that improvement? Why compel consumers to get an inferior cheese made "the old way" when the new way puts before them a more palatable article? If we can improve the make of the skimmed cheese a great advance is made for the dairy interest.

We believe in "progress and improvement." This is an age when men cannot be forced down into the old rut in which their fathers worked, and it is useless for friend WETHERELL or the American Agriculturist to spend their breath in trying to stem the current of new ideas. Oleomargarine added to butter lowers the quality; its addition is to give weight to the mixture and in this way to secure an unjust profit. Oleomargarine is added to skimmed milk not to increase its weight, but to affect certain processes in the fermentation and assimilation of the resultant parts of the cheese to improve it or make it more palatable and healthful.

The error which the opponents of oleomargarine cheese fall into is the mistaken notion concerning the office of butter in the cheese. The butter does not remain in the cheese in the same condition as when separated from the milk by itself. It undergoes great changes, the influence of the caseine destroys its flavor, and if separated from the cured cheese, it would be found to be a rancid, intolerably bad fat, totally unfit for human food. The more important office of the fat is its influence in modifying and assimilating the other constituents so as to make the cheese mellow and palatable, and the fat from the caul of the ox being prepared so that it resembles butter in its composition, is found to promote fermentation and assimilation in the same way as the butter, and hence its use for that purpose. Rancid butter can be purified of its rancidity and used in the same way as oleomargarine. It has been so used, but makes no better cheese than when oleomargarine is employed. Had the factories continued to use a low order of butter thus purified, could the opponents of the so-called oleomargarine cheese charge that it was an adulteration. By no means, because this fat passed through the udder and did not come from the caul.

We are opposed to the adulteration of butter with oleomargarine and have from time to time stated our objections to it in strong language in these columns and long before the oleomargarine cheese question was in controversy. We like to see a straightforward, honest course in journalism as in other matters, and the effort which some journals have made in mixing up oleomargarine cheese with oleomargarine butter and representing that we are an advocate of the latter and favor butter adulteration, we regard as a "fraud" quite on a par with the deception in butter adulterations.

We do not object to difference of opinion or the expression of honest conviction. We do not object to others taking different views from ours in regard to oleomargarine cheese, but we would like our opponents to give some facts. So far they have not given the name of a single consumer who has complained of oleomargarine cheese, neither has it been shown that the food is unhealthful or unclean or in any way objectionable as a food. On the other hand, the American Grocer, which was the first to commence this war, now admits that oleomargarine cheese "*is a fair, honest and palatable product of which they* (Capt. GARDNER'S Company) *need not be ashamed.*"

We like to see things called by their right names and have always so insisted in these columns. Others doubtless think differently; but we have yet to learn of a single oleomargarine cheese that has been sent away from the factories in any other name than that which rightly belongs to it. That some dealers have sold oleomargarine cheese for whole-milk cheese is no fault of the cheese or the process of manufacture. We do not countenance deception or misrepresentation whether it be in cheese or other goods. What we seek is progress in dairying. We do not seek to paralyze the efforts of manufacturers who succeed in making improvements by stepping out of the beaten track, but we feel constrained to congratulate them on their success—and we are sorry to see our esteemed friend of the Boston Cultivator laboring against "progress and improvement."

ASSOCIATED DAIRYING IN ENGLAND.

THE cheese factory system seems to be gaining ground in England. According to a correspondent of the Utica Herald (now in England) as many as eighteen factories have been established in the realm, fifteen of which are in Derbyshire. The system, he thinks, is thoroughly and firmly established, and that the spread of factories will be much more rapid in the future than in the past. It is now about six years since associated dairying was inaugurated in England, and its progress has perhaps seemed slower than was anticipated by many; yet, when we remember that during the first six years after the introduction of the system in America only ten factories were erected, we could hardly expect the English would do more than has been done. From a description of several factories visited in Derbyshire, it appears that the buildings are more substantial than the same class of structures in this country, but the appliances and internal arrangement are less convenient, and this feature imposes nearly double the labor to work them that it does for the same sized factories with us.

At some of the factories the cheese is made upon the Cheddar plan, while at others the American practice is adopted; but in either case it seems the cheese sells for a better price than ours, as it has sold from 76s. to 82s. the cwt. during the past season.

What will perhaps be a surprise to many, is the large quantity of whey butter made at some of these factories and yet, as is affirmed by the writer, the cheese made is rich, clean-flavored and palatable and in the words of the correspondent, "lacking the harsh, strong taste of our American." At the Ewall Marsh factory, which is under the charge of HENRY HARDING, 120 pounds of whey butter is made per week, which sells readily for 14d. (28c. gold) per pound.

At the Brailsford factory under the charge of Mr. OLIVER, and where the Cheddar process is adopted, the whey butter is of such excellence that it sells readily for 20d. (40c. gold) per pound, which is nearly equal to the price of the best prime cream butter. This, Mr. OLIVER states, is largely owing to his peculiar way of making it. In the first place, he mixes the cream skimmed from the whey with about twice the quantity of clear water; he allows the cream to rise and draws off the water, and with it many impurities which the water attracts from the cream. Then he uses a teaspoonful of alum and one of carbonate of soda for every twenty pounds of butter; this has the effect of hardening it, and prevents that oily appearance so common with whey butter. Mr. OLIVER'S cheese is pronounced very superior and has sold for the highest market price.

Great attention is paid to the curing of cheese. At the Kedlestone factory the writer says the curing rooms are warmed in a very superior manner; and he remarks further, that it would be well for Americans to imitate them in this respect. The following description is given:—"At one end they have a hot water stove and connected with it are cast-iron hot water pipes usually about four inches in diameter, extending all around the room exactly on the same plan as we warm our greenhouses and conservatories. This not only gives a mild, soft heat, but does not allow of the sudden fluctuations in temperature, so common even where steam pipes are used, as the water will continue warm for several hours if the fire should go out unexpectedly. The usual price paid for making cheese in the factories of England is 4s., 6d. per 112 pounds, or 1c. per pound our money.

At the Ewall factory one of the patrons has a model piggery, as a private speculation. It is a large, thoroughly ventilated brick building, with slate roof about 80x60 feet in size. A passage-way is left down the center with troughs and pens on each side, made of brick in the neatest and most substantial manner. At one end is the meal room, also a large cistern into which the whey runs, from which it is pumped into a smaller vat, and after the meal is mixed with it is discharged into troughs below. One farthing (½c.) only is paid for the whey per gal. and the speculation, the writer says, will prove profitable, and he adds, "The whole constitutes the best and least offensive piggery that I have seen connected with a factory."

During our examination of the dairies of Somersetshire in 1866, where the Cheddar process of cheese making was adopted, we were surprised in seeing the large amount of butter often made in connection with cheese dairying, and more especially as the Cheddar cheese commanded the best price of any sort in market, if we except the Stilton, a small cheese made only in limited quantity. We have frequently referred to this fact for the purpose of proving that it does not depend wholly on an excess of butter in cheese to make it palatable and high-priced.

The description given by the writer, who has recently visited the Cheddar factories of England, would indicate that large quantities of butter result from this process in cheese making, and yet the cheese is pronounced of finer character than American and sells for a better price. These facts are significant and may elicit the attention of American dairymen.

The Poultry Yard.

FOREIGN SUBSTANCES IN EGGS.

ONE of our English exchanges contains the following:—We frequently hear of strangely formed eggs, large and small, soft and hard, and possessing wonderful peculiarities. But the Ayr Advertiser gives the most recent case of abnormal construction, and not the least extraordinary. A friend of the editor, on cutting off the top of a hen's egg while at breakfast, found, it is said, a green pea imbedded in its contents. "Had it been dinner," says our contemporary, "with peas on the table we might have supposed it possible that one might have been jerked into a soft egg. But this was breakfast, with no peas on the table, and the pea was not only imbedded in the egg and left its form in the hard white of it, but, *mirabile dictu*, there were delicate rootlets at the base, as if the incipient pea had actually proposed to grow inside the shell!" Afraid of being accused of writing a paragraph with a Yankee flavor about it, the matter is verified and settled, because the writer says, "we have the most implicit confidence in the veracity of our informants, and what is more, we have been shown the pea and its tiny rootlets." We have seen peas with tiny rootlets too, but we never thought any of them grew in eggs. It appeared unnecessary in the present instance to see the egg; the pea was sufficiently convincing to the Scotch editor. "Naturalists," says he, "we pause for an explanation!" We confess we are puzzled at the pea. Had his friends found a big gooseberry in the egg, we might have thought it one of the spontaneous products of the "silly season."

A few years since a similar instance was recorded in these columns, and it called out several very positive assertions from our correspondents, that they too had found various foreign substances in hens' eggs, which had been discovered when broken, either before or after cooking. One lady found the head of an iron bolt about a quarter of an inch square in an egg which she broke to make a custard. This bit of iron we now have in our possession, and although we know from a scientific point of view, no foreign substance can possibly get into an egg without rupturing its shell, or the envelope enclosing it before the shell is formed, still we dislike to tell intelligent men and women who have found such things within eggs, that they are mistaken. If we ever find a pea or iron bolt head in an egg, we shall feel inclined to believe our own eyes in the matter, science or no science.

ABOUT A HEN-YARD.

I WISH to inclose about eight acres of ground for a hen-yard and would like to inquire which would be the best and cheapest method to do so, and about how high to build the fence, which will be about a third of a mile long. I have about 200 hens and intend to increase them as fast as possible, and have about 80 sheep. Will it do to let the sheep run in the yard with the hens part of the time? The ground I shall inclose is partly covered with huckleberry bushes.—C. A. RUSSELL, *Providence, R. I.*

THIRTY sheep would be a superabundance of stock for eight acres, even if well seeded with grass. This appears to be partly covered with huckleberry bushes—possibly wet and if so, not suitable for either sheep or poultry. The sheep anyway had better be omitted if poultry breeding on a large scale is proposed.

If the ground is dry enough for poultry, it will be better to re-divide the eight acres, making two, four or more yards, with separate houses and accommodations for each, even when all of the same breed. This will diminish the dangers of disease, always the great difficulty in breeding large numbers of fowls together.

A picket fence eight feet high, with pickets well sharpened, is the best fence for a hen-yard; but even this will not secure the fowls if the rambling varieties are kept, and especially if there are trees in the yard. With Brahmas and other quiet breeds a lower fence will secure them effectually.

The Garden.

SHALL WE CULTIVATE TRUFFLES?

For thousands of years the "Truffle" has been considered one of the greatest of delicacies among epicures, and, even at this day, it commands about $4 per pound in the European markets. We presume that most of our readers know that the Truffle of commerce is a species of mushroom which grows underground, and usually among the roots of certain species of oaks. It is found in various parts of Europe, also in Japan and the East Indies, flourishing generally in light, dry soil. It is somewhat of an irregular, roundish form, with a coarse, rough skin, the inner part, or flesh, being of a whitish color, possessing an agreeable fragrance, and, when cooked, a delicious flavor, besides being considered very wholesome food.

The common Truffle, (*Tuber cibarium*), as we have said, grows entirely underground, showing no surface signs of its presence, even in localities where most abundant; consequently, to find the tubers is no easy task, without the aid of some animal with a more acute scent than man. Happily, however, for the Truffle hunter, he readily finds an assistant in the swineherd, for hogs are very fond of these tubers, and can scent them while buried several inches in the earth, and, by proper training, a pig is soon taught to assist his master in seeking out these hidden treasures. Dogs have also been taught to point out the spots where the Truffles are hidden.

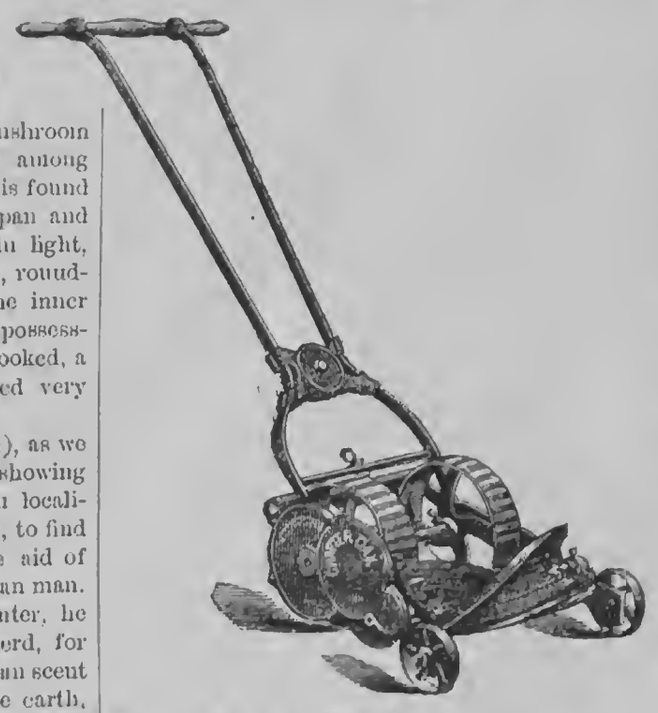
Although this plant has been so long known and extensively used as a food for man, its habits in regard to propagation still remain, in a great measure, a mystery, but it is supposed to multiply in a similar manner to the common mushroom. There is probably a minute mycelium which spreads through the soil, and, at certain periods of growth, the tuber, or truffle, is developed therefrom. Many theories have been advanced in regard to the origin of the Truffle, and we notice in a late number of the Practical Magazine that M. RAVEL of Montagnac, Department of the Basses-Alpes, says it is caused by the sting of a particular kind of fly, which pierces the roots of certain species of oaks, causing them to produce the tubers in a similar manner as galls are produced on the twigs and branches. But the structure and properties of the Truffle are quite distinct from any true gall which is known as being caused by the sting of an insect; therefore we must conclude that Mr. RAVEL'S theory is as wide of the mark as scores of others advanced in years past. Still, while his theories are vague and unsatisfactory, his practical experiments and observations are both interesting and valuable. He found that the Truffle was more abundant near the roots of the Pubescent Oak (*Quercus pubescens*) than elsewhere, although found sparingly about those of the *robur* and *lanuginera*. M. RAVEL claims, that from three and a-half acres, planted a few year since with the first named Truffle Oak, he has already obtained some five hundred pounds worth of truffles, and he values the annual crop at about one hundred pounds, or five hundred dollars. It is also said that near Montagnac there was, in 1857, fifteen hundred acres planted with these Truffle Oaks, and doubtless the plantation has largely extended since.

Now, as the oaks referred to will thrive in our climate, why cannot we introduce the Truffles along with them, adding another valuable food-plant to our already very extended list? It is quite probable that the climate of the Middle States, or that of the mountainous regions of the Southern, would be better adapted to the culture and development of this esculent than the more northern; but this question needs to be settled by experience. As a high, dry and rather poor soil is said to be the kind in which the Truffle and Truffle Oak succeed best, we should experience no difficulty in supplying the proper requisites for its extended culture without interfering with other products. It is also quite probable that some of our native species of oak might be congenial to the Truffle plant, if the latter were once introduced and planted in close proximity to their roots. But the true Truffle Oak of Europe can be obtained at foreign nurseries for about $2 per thousand for one year seedlings; there, it would not be advisable for one attempting the production of Truffles, to experiment very extensively with other species.

Our conclusion is, that the man who shall first produce the true Truffle in America may be pretty certain that his name will go down to posterity as one who did not live "all in vain," even if no great amount of money was made out of the experiment.

CHARTER OAK LAWN MOWER.

With increased attention to home adornment, Lawn Mowers have come in demand. They are now used by hundreds of families, who, 20 years ago, had never known of such a thing, as indeed they had never dreamed of having a lawn. Still there are many more who have not lawn mowers but want them, besides, not a few who need such an implement, but have not yet learned that they want it. To enable all such to be accommodated cheaply, we put the Charter Oak Lawn Mower (see cut) in the RURAL Premium List for 20 copies at $2.65, or 35 at $2.15 each. We will



also furnish a Croquet Mower, cutting 9 or 12 inches in width, very convenient for trimming grass on croquet grounds, for 15 subscribers at $2.65, or 30 at $2.15.

A START IN MARKET GARDENING.

EDS. RURAL:—Some eight or nine years ago I was a subscriber to the RURAL NEW-YORKER, but I never read it with the interest I do now. I am now taking it from the news room. I have bought twelve acres of good creek land, adjoining the corporation, for a market garden. About one acre of high land overlooks the garden. It is a favorite business spot. I am setting this to trees and grapes. I set them this fall. I would inquire if grapes will not do well on dry creek bottoms, as wild grapes grow in swamps.

This fall I set one acre to strawberries in the bottom land, and the best varieties of raspberries and blackberries I could get. I propose having a Honey Locust hedge, and have planted two bushels Locust beans. I shelled about one pint and planted the balance in the pod. I can get the beans in sight of the garden. I prefer this kind of hedge, as it is a native of this country and will not freeze out. I want to know if they will come up in the spring, or will they lie in the ground longer.

I have a swale of about one acre which I have set apart to cranberry vines, and also planted some Cape Cod cranberries. I am experimenting on the berries. I have always been inclined to fruit growing. I like to graft, and work at such business as trucking. I cut a ditch, and brought a spring run close to the building spot, and I will want to know something about a fish pond after awhile, but I am not quite ready for that yet. I want to make the garden a credit to the little town of Auburn. I will take your paper from the news room to January first, and then subscribe for the year. I could not do without it now; it has benefited me already.

Auburn, Ind., Dec. 13, 1875. G. S. M.

SAWDUST FOR WALKS.

In the extensive wild garden adjoining the well-kept pleasure grounds at Cadland, near Southampton, the gardener, Mr. Harnett, has used sawdust as a dressing for the pathways cut out amongst the heath and trees in the woodland. The transition from smooth mown lawns, bright, clean gravel walks, and brilliant flower-beds, on the one side, to the adjuncts of this wild garden, is both pleasing and refreshing, and seems specially enticing when the sun sheds a tropical heat, and quietness and solitude are most appreciated. The walks are firm and yet soft to the tread; the sawdust soon becomes of a neutral tint, closely allied to the crushed dried leafage of the Beach, which here so much abounds. Weeds seldom grow, and these are easily kept in check with the hoe, and a light sweeping with a broom keeps all clean and neat. —*D., in the Gardeners' Chronicle.*

HOT-BED FOR SWEET POTATOES.

The following plan for preparing a hot-bed is a good one:—Dig out a space as large as the bed is wanted ten inches deep, and filled with decayed leaves of wood. Upon this put eight inches of fresh stable manure. Pound down well, and cover this with three inches of rich, well pulverized dirt. Let it stand until the first heat passes off, which perhaps will take a day or two, owing to the weather. Put the sweet potatoes on the surface of this layer of dirt and cover with two inches of soft chip manure.

Field Crops.

CORN CULTURE.

Now that a good corn crop has been raised and a good deal of interest manifested, more experiments having been made the past year, owing to more reading having been done by the farmers than usual—which is no doubt the fact, and an encouraging one too—we propose to give such items of interest and true principles of the culture of a crop so important to the farmers of the West. The following is by John Elliot in the Ohio Farmer:

According to promise, I send you an account of my corn crop this year, with method of cultivation. My farm consists of one hundred and seventy acres of high rolling land, situated in Chippewa township, Wayne county, Ohio, adjoining the Medina county line, and I have lived upon it fifty-two years.

The first piece of corn I shall mention was a field that has been under cultivation over fifty years. It is free from stumps and is more clay than sand. I manured four acres in 1873, and planted in tobacco. In 1874 I took off it a good crop of sound corn. Last spring I plowed five inches deep, harrowed smooth, marked rows three feet apart and drilled in the corn, twelve inches apart in the row. It was planted May 18th, was cultivated three times and hoed once. I went through it and carefully pulled off all the suckers and stalks where they happened to be more than one in a place. I harvested about the middle of October and measured 640 bushels from the four acres, or 160 bushels of ears per acre of good sound corn.

I had another field of seven acres, clover sod, that had been under cultivation eight years. It was encumbered with a good many stumps, and never had any manure or fertilizer of any kind, except what it obtained from a lot of sheep that ran on it for three years. It was plowed and cultivated the same as the other, and it yielded 135 bushels per acre. Many of the ears measured eight and nine inches in circumference, and my hired man picked up one ear twelve inches long, and containing over 1,100 grains, the grains measuring half an inch in length.

The land for corn must be dry. Corn delights in loose, dry, warm soil. If it is soaked with water, all the sunshine of the hottest summer cannot make it warm, and all the manure that can be put on it cannot make it yield a good crop. To raise a good corn crop one must have good ground, well prepared, good seed, early and good and careful cultivation, and the weeds must be kept down the summer through. I prefer to plant in drills, because it secures a more even distribution of the crop over the ground, so that each plant secures its share of the soil and sun. The growth is more even and the ears more perfectly set and better filled. In cultivating I use the hoe to keep down the weeds.

If you would have good corn, the greatest pains must be taken with the seed. It must be carefully selected. Some farmers lose hundreds of bushels every year by carelessness in this particular. If you have not good seed of your own, buy it even at an exorbitant price. You will make money in the end, for it is labor and vexation to re-plant corn, and the re-plant rarely amounts to anything.

My corn is the yellow gourd seed and has from sixteen to twenty-four rows on an ear. I have had it for years, and have improved it and brought it up to the present standing by carefully selecting the best ears every year, at husking time. My plan is, when husking, I find an ear that suits me, to leave a few husks on it and put it by itself. After I am through husking, I go over the whole lot again, rejecting all that are not filled up to the end of the cob, and that have not sufficient depth of grain. Then I put away in the garret, out of the way of mice, till wanted. Let me add that I never select seed from a stock that bears two or more ears. Here, I suppose, I shall differ from many of our best farmers, but I can't help that. My theory is derived from close observation for many years. I would ask all who differ, go into your field, any year, select a dozen ears from stalks that grow more than one, and a dozen from stalks that bear but one, shell, measure and compare, and then be convinced.

BROOM CORN.

Broom Corn, like Indian corn, thrives best in rich, alluvial soil, and the land is prepared in all respects as for the latter crop. I use a horse-drill making two rows and marking the third, which serves as a guide on the return. One bushel of seed plants about 14 acres. When the corn is up about two inches I go through the rows with a horse-scraper; that cuts the weeds and scrapes the earth from the corn, after which the field hands, using a light hoe, scrape the earth from the corn, at the same time thinning it out when too thick. After this the labor is mostly performed with a horse and cultivator, going through five or six times, concluding with a hiller that throws the earth up to the roots. In this valley it requires about 90 days to mature. After the brush is in condition it is bent down so as to be cut, leaving a stem about seven inches long, after which the work is simultaneous of cutting, handing to the scraper, assorting, scraping and placing upon drying poles in open sheds of 15 to 21 tiers, according to the hight of the shed. When baled for market, two lengths are placed with butts out and filled in the middle to preserve a good shape, and pressed in a machine for the purpose, holding about 275 lbs., with four bands of No. 10 annealed wire. Prime green brush bears the highest price. Green hurl stalks, braided, will work itself up if there is sufficient small brush to work up the long, and Red is ripe when cut. Land well cultivated and adapted will yield one ton to three acres. After the brush is cut, and before frost, we plow under the standing stalks, and the following spring gang the land, followed with harrow and roller.—*H. B., Mount Morris, N. Y., in Tribune.*

EFFECTS OF TREES ON CLOVER.

Some species of trees seem to be specially injurious to vegetation beneath their shade, and of these the butternut and hickories, or walnuts are conspicuous examples. The fact is frequently noted that clover, corn and hoed crops are especially liable to injury. We have often seen clover killed outright around a butternut tree for a distance equal to the extent of its branches, and also presumably of the underground branches or roots. At the same time clover will thrive under apple, pear or other fruit trees where the ground is not unsuitable, and the failure under butternut and walnut trees suggests the query whether it is caused by the roots of one kind of trees exhausting the moisture near the surface while the others draw it from the subsoil, or whether it may not result from the direct injurious effects of the drippings of water from the leaves and branches. Many farmers believe that butternut and walnut leaves poison the soil for certain kinds of crops. In order to test this question we are instituting experiments, taking butternut leaves and spreading them on a few feet square of clover to note the effect next summer. If the leaves are really poisonous to vegetation the effect will be seen away from the trees as well as near them. Our guess is that the butternut roots exhaust the subsoil moisture worse than the roots of other trees. Butternut makes a poor shade, and this tends to keep the land dryer. We noticed last fall that young clover of last season's growth grew quite well under a butternut tree. The bad effect seems not to be manifested till the second year, by which time the clover roots should strike the subsoil.

This subject is well worthy of attention and investigation. Clover is so important and almost necessary as a renovating crop, that anything which detracts from its growth is a great loss, and it is highly important that we should know wherein the injury consists. We are entirely convinced that fields kept mainly for tillage should be cumbered with few or no trees and especially that those kinds most injurious to tilled crops or clover should be removed. They are as much worse than rocks in a field as a continued injury is worse than an inconvenience. By making the soil less productive, trees in cultivated fields become one of the worst obstacles to good and successful farming.

MANURING POTATOES.

ED. RURAL:—Being a subscriber to your valuable paper, I take the liberty of asking a question which, if you will answer, will benefit several. I have fresh stable manure and partly rotted stable manure, and can get pulverized charcoal in limited quantities. Should they be used together to manure in the hill potatoes at the time of planting or separately? JNO. J. HALL, *Eureka, Nev.*

The fresh stable manure will do better applied broadcast on the surface of the ground this fall. The rains and snows of winter will mix its fertilizing properties in the soil, and with little loss. If applied directly to the hill, fresh manure might cause potatoes to rot. Small quantities of rotted stable manure with charcoal can doubtless be used in the hill with benefit to the crop. We incline to the belief that charcoal is a preventive of rot. At any rate, it can do no hurt, and is a valuable absorbent of ammonia.

Good Corn.—The Husbandman says:—Geo. C. Hill of Burlington, Pa., presents the Elmira Farmers' Club with several fine samples of corn on the ear. He raised during the past season 247 bushels of shelled corn from two and one-fourth acres. The corn was planted on the 7th of May. The land was manured this year and last. This piece of land was planted to corn in 1869, oats in 1870, wheat and buckwheat in 1871, oats in 1872, corn in 1873, 1874 and 1875. There are probably fifty samples of corn in the Club Hall, but those presented by Mr. Hill are the finest in the lot. Some of the ears are 15 inches long, and are plump and sound, almost perfect.

The Horseman.

FEEDING WORK HORSES.

The Cincinnati Gazette gives the following account of the way the Adams Express Company feed their horses, which are always noticeably sleek and fat:

The number of horses kept at the stable is 54. Four hostlers attend to these. Promptly at 4 o'clock A. M. the watchman of the stable gives to each horse eight ears of corn. Then, about 5 o'clock, the hostlers commence their duties. Of those under the care of each, one by one is led to the watering trough and then to the urinary. This consists of a pit sunken 10 or 12 inches below the level of the basement ground floor and kept compactly filled with sawdust and short shavings. And it is a remarkable fact that a horse in this stable scarcely urinates excepting at this place, especially prepared for him. When horses come in from their work the harnesses are removed, and they are then led at once to the urinary. When a fresh or green horse comes to the stable, by being driven with some old "stager" that knows the rules of the stable, the new comer soon learns to conform to the habits of the older inmates.

From 5 to 7 o'clock, each horse is taken in hand and thoroughly curried, brushed and cleaned, from ten to fifteen minutes being spent by a hostler upon each horse. A damp woolen cloth is always rubbed over the coat of a horse after being curried and brushed. This serves to remove all loose dandruff and to give that fine, glossy, sleek appearance so noticeable in the animals of this stable.

The horses are fed nothing in the morning excepting the eight ears of corn. After being led back to the stalls when cleansed, they are then ready for work. The same process of carrying, brushing and cleaning is also gone through with at noon and at night, at the close of their forenoon and afternoon's work. At noon each horse is fed with half a peck of oats. At night chopped feed is given. This is composed of sheaf oats or rye straw passed through a straw cutter and then, when wet, ground oats, corn and bran mixed up with it. A peck and a-half of this is given to each horse. In addition to the chopped feed the rack is supplied with eight or nine pounds of bright, sweet timothy hay, this being the total amount of hay which is fed. And perhaps of this supply the horse will not eat more than five pounds during the night, finishing up the balance during the next day.

While Mr. Barrett is particular to give nothing but clean timothy hay in summer, in cold weather he is willing to feed hay which is one-third clover. About once a week a peck of oil-cake meal is mixed up with the chopped feed, being equal to about a third of a pint to a horse. This promotes the uniform good condition of the animals. And if at any time the urine of a horse is cloudy and thickened, a tablespoonful of pulverized resin mixed up with chopped feed is given him. This acts upon his kidneys and the difficulty is at once removed.

The horses are given what water they want as they come in from their work, unless they are "green," and then care is taken not to water or feed until they are thoroughly cool. In a few weeks, after becoming habituated to the regimen of the stables, the same course is taken with the "late comers." Of course, if horses come in over-heated, then they are not watered until cooled off.

A very marked feature connected with the stables is that the air is so sweet and fresh. And probably this is owing largely to the fact that scarcely any urinating ever takes place in the several stables, and that the saturated sawdust and shavings in the urinary itself are removed from the stables every third day.

DECREASE OF HORSES.

It is said that the number of horses is decreasing in England, and of those used there an increasing proportion are imported from the Continent. The effect of high farming in England is to restrict farmers to products of quick maturity, insuring speedy returns from capital invested. The improved Short-Horn cattle have reduced the time required for growing and marketing a beef from four years to two, and in some places they are fattening beeves at eighteen to twenty months old. There is no way of making a colt fit for hard work before he is four years old—or three at farthest, and in the meantime he is a constant expense with the liability of entire loss from accident or disease. It is probable also that in England much more than in this country there is decreased demand for horse labor on account of the employment of steam power in nearly all mechanical and many agricultural operations. Steam plows have been for several years in successful operation, and their economy on large and level farms is undoubted. Of course, such implements would cost more in this country but they would also supersede dearer labor, and probably in the long run the gain from their use, especially on large Western prairie farms, will be found as great as in England. Horses will never go out of fashion—possibly not soon be less used than now—but the proportion of power furnished by horses is steadily decreasing, and is destined to further decrease. Engines are used for threshing, wood sawing, feed cutting, and various farm operations requiring considerable power and engines are now made cheaply and portable, to be used on all the farms in a neighborhood.

That horse breeding is less profitable at the West is indeed a matter of some surprise. Cheap lands and abundance of feed would indicate this section as the natural home of the horseman. But at the West enormous and usurious rates of interest, from ten per cent. a year to two per cent. a month, take away profits and compel farmers to invest only in products giving quickest returns. Sheep and cattle are superseding the business of horse breeding. It costs less to keep a calf till it is three years old than a colt till it is two, and at three the steer will be fattened and turned into cash, while the colt must wait two years or more before finding a purchaser, and at last may very possibly be worth less than the steer. Poor stock is of course responsible for much of this loss; but there is more variation in prices of horses than of cattle. When a man grows a calf till it is three years old to be sold for beef, he can calculate pretty closely how much it will weigh and what it will sell for. Not so a colt. It may be one of the few prizes, selling for $500 to $1,000; or much more likely, it may be a blank—worth less than the expense it has cost. Aiming at the fashionable and fast breed of horses has intensified this evil. If the progeny of one of the trotting stallions is not among the few that "can make their mile" inside current fashionable trotting rates, he is not wanted by the gambling fraternity, is of no use on the farm and precious little use anywhere else. A much safer business and we suspect more generally profitable, is the breeding of good farm and work horses. They are less liable to accident, have a surer sale and at a higher average price than the majority of would-be racers.

THE NUTMEG.—MYRISTICA MOSCHATA.

Our readers will remember our illustration of the Clove tree which appeared a few weeks since. We now present them with a sketch of the Nutmeg, botanically called *Myristica moschata*, a native of the Moluccas, attaining a hight of twenty-five feet and resembling quite closely in its general appearance a Pear tree. The male and female flowers are borne upon different plants, (*dioecious*), the first in clusters resembling those of our Ericas, fragrant, and of a yellowish color—while the female or pistillate flowers generally exist alone.

The fruit is pear-shaped, consisting of a fleshy pericarp breaking open at maturity and exposing the seed. This is partially enveloped by a bright scarlet netting which changes in the drying process to a light-brown and is then known as Mace. The kernel within this *arillus* is the dark-brown, wrinkled nut known as the Nutmeg. The yield of each tree is said to be about 5 lbs. of Nutmeg and 1¼ lbs. of Mace. We copy our illustration from the Journal of Horticulture.

—The preceding article was intended for the Arboriculture department, but overlooked until after that page was electrotyped. Hence its contiguity to the Equine race.

The Vineyard.

THE BEST GRAPE.

Scores of times, during the past twenty years, *the* best grape for all localities and purposes has been announced, but we are about as far from possessing it as ever. It is true that we have many better varieties of grapes than were known ten or twenty years since, but the *one* first-class grape for general cultivation is still wanting, and will, probably, remain a hidden treasure for some time to come. But, as we have progressed in this direction, there is every reason for believing that a still further advance is not only possible but quite probable.

There are men still at work experimenting with seedlings, and every year some of their wares come to light in the shape of new sorts of promise, and this is all that it is safe to say of any variety until more has been proved through dissemination and extended cultivation. The experience of our grape growers, during the past two decades, has taught them a lesson that will not be unlearned in the next two or more, and it is not safe to decide upon value from the quality of the fruit or its appearance or that of the vine, as seen in any one locality.

These conditions must also be looked at in opposite directions, for if a variety promises to be only second-rate in quality, it may possess other valuable properties which will eventually give it a prominence over those of superior flavor. We have a noted instance of this in the Concord, which, at the time of its advent, was denounced in no unmeasured terms by those considered authorities in grape culture, still, in spite of this kind of opposition, it soon became the most popular grape in America, and even at this day has not fallen very low on the scale, even with the many powerful rivals in the field. The Delaware, however, which came in with all the honors imaginable, on account of its generally acknowledged superior quality, has dropped far behind its poor but more robust rival.

We might, if necessary, review the entire list of noted sorts, showing why they failed to meet expectations, but the well-known characteristics of the two sorts named above will illustrate the point which we desire to bring plainly into view, *i. e.*, that vigorous, robust constitution, and fair quality of fruit, will surely win the race against any enfeebled sort, no matter how superlatively good the fruit may be when obtained. We say this more emphatically at this time, on account of some objections which have been made in regard to what was said in these columns a few weeks since, in regard to the value of a few new and unnamed seedlings of white grapes of purely native or *vitis labrusca* origin.

It is certainly well to aim high in fruit culture, but, at the same time, a well filled bag of ducks may go further to supply a family than one lone snipe. Now the best grape for the masses is the one which will yield an abundance of good, wholesome fruit without costing more to produce it than the average cultivator can afford. In some localities and soils the very best in quality can be produced nearly or quite as cheaply as the inferior sorts, and, under the circumstances, a man would be foolish not to take advantage of them. But it is not fair to advise a man to plant oranges in a climate and soil where he can scarcely succeed with crab apples.

SOME IDEAS ABOUT GRAPES.

A writer in the Cincinnati Gazette says that "the more he knows about grape rot the more he don't know." He illustrates this proposition admirably by suggesting a theory that grape rot is caused by the burning heat of July when the fruit is forming. Letting this nonsensical idea pass for the very little it is worth, we quote something decidedly more valuable in a practical remedy, for grape rot. It is found in spading manure in the ground, of course cutting off old grape roots in the fall, and causing new rootlets to push out into the fertilized soil. The following experiment was very satisfactory and indicates that there is something valuable in this practice.

Early in November the ground around the collar of the vines was removed, leaving a dish of about a foot in diameter and six inches deep and a pitchfork of good rich manure applied. This was done to some eighteen hundred vines, or three-fourths of an acre. The manure then gave out. The next season the rot was very great, but the vines so treated escaped it almost entirely, making some 300 gallons of wine, while the 8,000 vines remaining yielded but 50 gallons all told. On opening the manure it was found to be pierced with roots a foot long. A deep furrow was then plowed between the rows and partly filled with manure and covered. These vines have averaged their 300 gallons for four years in succession.

To ascertain the best time to apply the manure, experiments were tried monthly till the 1st of June. All the vines so tested after the beginning of March showed no benefit whatever, while those done the fall before gave the best results.

To start new roots into an exhausted soil would show but a transient improvement. This many have tried. But, followed up by a covered deposit of manure, the result will be more lasting.

There is no doubt that almost all kinds of grape vines are benefited by occasional manuring. Possibly the good result might not be attained by top-dressing, as it may have depended on severe root pruning, causing new rootlets to form nearer the vine, and probably, also, nearer the surface of the ground. This remedy for grape rot is worthy attention in all localities where it is prevalent.

The Centennial.

DAIRYMEN AT THE CENTENNIAL.

The American Dairymen's Association has issued an appeal to Dairymen and Patrons of Husbandry throughout the entire country for aid in presenting a creditable exhibition at the Centennial Exposition. Mr. J. V. H. Scovill, Chairman of the Committee appointed for this purpose writes:—From such facts as have come under my observation I am led to believe that dairymen are laboring under great embarrassment for want of more concerted effort, both in the care of their goods to be placed on exhibition at the Centennial and in the arrangement and economy of space, and, in order to secure more uniformity of action, I unhesitatingly issue the following call:—"All Dairy Associations or Boards of Trade in the various States, whether State or local, are requested to send one or two delegates, as is most convenient, to a meeting to be held at the City of Rome, N. Y., on Wednesday, the 12th day of January, 1876, for the purpose of taking such action as will best unite our various interests, and at the same time stimulate the largest and most effective display."

Contributions may be fowarded to J. V. H. Scovill, Paris, Oneida Co., N. Y.; T. S. Gold, West Cornwall, Conn.; O. S. Bliss, Georgia, Vermont; David W. Lewis, No. 85 Broad St., New York City; Artemas Ward, Sec'y of Produce Exchange, Philadelphia; Geo. E. Morrow, No. 407 W. Madison St., Chicago, Ill.

CENTENNIAL BELLS.

The Centennial Year was ushered in on Friday night by a grand celebration in Philadelphia. Beside a parade of the military, a salute, and a general illumination of the public and private buildings, other events transpired appropriate to the occasion. On New Year's morning an American flag of the original design was raised on the old State House steeple and a parade of the New Year's shooters occurred. Altogether the Philadelphians seem to have inaugurated the Centennial in a right joyful and spirited manner.

Many other cities and villages celebrated the event appropriately—the ringing of bells, illuminations, etc., etc., being the order of the night. The Dutchess Co. (N. Y.) Board of Supervisors provided for the ringing of the church and town bells in every town in the county at midnight on Friday, which we presume was accomplished successfully.

Diary of a Ruralist.

DAILY RURAL LIFE.

From the Diary of a Gentleman near New York City.

NATURAL GUIDES IN HORTICULTURE.

Dec. 23.—There are many cultivators of plants who are constantly proclaiming the great importance of "following Nature," and still they are usually the first to be astonished at the inflexibility of natural laws. The difficulties to be met in searching after guides in these matters are mainly our ignorance of the natural functions and properties of plants. We may find two species of plants growing upon the same rod of ground in a tropical climate, and while one will be capable of standing repeated freezings and thawings without any apparent injury, the other dies with the first chill. Nothing that we know positively of natural laws will guide us in discovering the why or wherefore of the difference in the hardiness of the two; still the fact that there is a difference is indisputable.

The same principle pervades all of Nature's production, and our only sure guide in horticultural matters is to assume to know nothing positively until it has been learned by experience. Of course the discoveries of one man may answer us a guide to thousands of others, thereby saving loss of time in conducting individual experiments; but we must not overlook the fact that variations are likely to occur with every change of soil or location.

It may appear somewhat anomalous that a raspberry which succeeds perfectly in the rigorous climate of Canada, or passes the winter uninjured on the shores of Lakes Erie and Ontario, fails in the milder climate of New Jersey. But we have scores of instances of this kind, not only among raspberries, but other families of what are termed hardy plants. The Northern species of pine, spruce and other kinds of evergreens fail as we approach warmer climates; but in these instances Nature furnishes us with an excellent guide for cultivation in the distribution of the wild plants of field and forest. We find the hardy Northern species occupying the higher table lands and mountains as they approach the warm climes, until they entirely disappear in the tropics. The Hemlock Spruce, which forms the larger part of some of the most extensive of our Northern forests, is found but sparingly in the vicinity of New York City, and it is here that we first observe indications among cultivated specimens that this species is not quite at home in so mild a climate. Few of the Rocky Mountain evergreens which thrive near the line of perpetual snow will thrive with us here; therefore we must conclude that the same law of adaptation which prevents us from cultivating the orange in the Northern States also excludes the hemlock and other similar evergreens from the Southern.

From this cursory glance at the natural distribution of species, it is easy to see how the novice in horticulture may be misled by taking it for granted that because a tree is hardy and succeeds in Maine it will thrive in New Jersey or further South. "Hardy as an oak and will thrive anywhere," is a statement frequently appended to the descriptions of new plants, but it is a somewhat contradictory piece of information, for if they are really very hardy and of Northern origin it is pretty conclusive evidence that they will be worthless in a warmer climate.

The natural guides to success in horticulture are abundant, but one needs considerable study and experience to enable him to make the proper application and avoid being led into errors thereby.

CUTTING CIONS AND MAKING CUTTINGS.

Dec. 24.—Before the cold of a long winter has weakened the vitality of the young wood of trees and vines is the time to take off cions and cuttings. With many of the most hardy kinds this operation may be deferred until spring, but it is best as a general rule to do it in the fall or early winter. Wood intended for grafting in the spring should now be selected from the best-matured shoots of the past season's growth. The shoots may be taken off and left entire; but if more than 18 to 24 inches long, they may be cut in the center, and then either tied in small bundles or spread along in shallow trenches, the lower ends being buried in moist soil in a cellar, or in any other material which will prevent them from becoming dried or shriveled. If one can obtain a good quantity of sphagna or swamp moss, slightly moist, the cions may be wrapped in this, and then put away in boxes, where they will be kept cool until wanted for use in spring. Sawdust and tan, both, are also used for this purpose; but I have never found anything equal to moss, as it holds moisture for a long time and never ferments or generates heat while undergoing decomposition. It is also an excellent material in which to store cuttings of all kinds in winter. But cuttings of grapes, currants, gooseberries and various kinds of hardy flowering shrubs and climbing vines, if made now, may be buried in soil, sand or sawdust, and stored in a cellar or in pits in the open ground.

Next spring, after it is too late for taking off cions for cuttings, there will doubtless be many regretting their forgetfulness in this matter; hence a hint at this time may be of value to those who are more or less prone to be negligent.

FREEZING SEEDS.

There are many kinds of seeds which do not grow freely unless exposed to a freezing temperature or considerable heat. Those natives of cold climates, such as the hickory nut, black walnut, heavy locust, *Shepherdia*, and similar seeds with hard, horn-like coverings, should be exposed to the action of frost during winter, but not in a dry state, for under such a condition the freezing would do more harm than good. The best way to manage such seeds is to mix with wet sand and put in a box or other tight vessel, and then half or wholly bury in the open ground, but do not cover so deep that they will not freeze during the coldest weather. This appears to be the most natural way of preservation, without sowing them where the trees are to grow.

Fall planting will answer with many kinds, but there is always more or less danger of nuts and edible seeds being destroyed by mice and other vermin, from which, however, they are readily protected when mixed with sand and kept in boxes. I have known hickory and chestnuts to be dug up and carried off by squirrels and mice during a thaw in winter; hence it is best to guard against such depredators.

Piscifulture.

ANGLING IN NORWAY.

Occasionally an American angler finds his way to Norway, but it is very seldom. Henry Harbeck, Esq., who has spent two seasons there, says:—"I leased a part of a river for salmon fishing in the summer of 1874, for which I paid £10 sterling, or about forty-five Norwegian dollars; but that is cheap, as the best rivers frequently bring from £40 to £140. I believe I am the only American angler who visits Norway. The rivers are mostly fished by Englishmen. The climate is very fine, and I have never been troubled by mosquitoes, or black flies, or punkies. I arrived at the river the 20th of June, and it being very early in the season for that river did not get fast to a salmon for four days. That was in the morning. In the afternoon the river, or my pools, became very muddy, caused by a clay bank washing away, which had often taken place for many years. Then I stopped fishing and went away to another part of the country; came back in about a week and the water was too high, but it lowered in a few days, and in three weeks time I killed about 180 pounds of salmon and sea trout. The sea trout are different from the Canadian trout in their game qualities, they being the strongest fresh water fish I ever saw of their size. I caught none over six pounds weight, and as to the salmon in that river, I never saw such strong ones, although I have fished wild rivers in Canada and Ireland. They immediately take down stream and are like race horses. They are long fish and terrific runners. I never saw their equal. The rivers differ, though; in some they are more gamey than in others. They were not large, the largest being only eleven pounds; but in game I never had more sport with a twenty pounder. They run small in that river, though. This summer, being better acquainted with the country, I had much heavier fishing; but the river brought a considerable higher rental."

STOCKING STREAMS WITH TROUT.

Seth Green writes from Rochester, N. Y., to Forest and Stream as follows:—"In answer to your inquiries as to how I know our depleted trout streams can be stocked again and be made a success, I will explain. In the year 1871 Charles Upton, a banker in this place, bought a small, played out trout stream about one mile long. I put 4,000 young brook trout one inch long in the stream. During the summer of 1872 the creek was alive with yearling trout. In 1873 Mr. Upton commenced fishing for them. He would go out at 3 P. M., after bank hours, and his take would be from 50 to 100 during the afternoon, and in 1874 his take would be from 20 to 60 three year old trout, and in 1875 his take was from 5 to 19. A good many of the 1875 take were pound fish. Care should be taken in putting young trout in trout streams, and to not put in any more than there is food for. They feed on all kinds of small animalcule and larvæ of small flies. I have just returned from the lower end of Lake Ontario. I have had great success in gathering salmon trout spawn. I shall have some millions to distribute next spring.

People engaged in fish culture are invited to communicate the results of their observation and experience for the benefit of Rural readers.

Arboricultural.

NOTES ON BUDDING AND GRAFTING.

The end sought in propagating plants by the common processes known as budding and grafting, is one and the same, but the operations are quite distinct. Budding as generally practiced is performed in summer or early autumn, while the plants operated upon are growing on just as the season of growth is ceasing but not fully closed. But in grafting the operation is usually performed while both stock and cion are in a dormant state, the union between the two taking place as the sap begins to flow and growth commences in spring. The various methods of budding and grafting have been so frequently described in these columns that it is probably not necessary to repeat them, but our object in referring to the subject at this time is to point out to the novice in horticulture some of the variations which may be practiced or rejected in these methods of propagation. With new beginners in any branch of business or profession, there is always more or less inclination to make experiments for themselves, and while this is commendable to a certain degree, it may lead to a useless waste of time and means. In propagating plants there are many possibilities and different ways of performing certain operations which experience has shown are not worthy of being introduced into general practice. It may be possible to grow pears on thorns and mountain ash stocks, but is it advisable to do so while we have other kinds which are far better. Then again, we find that the ordinary methods of grafting may be practiced successfully upon certain kinds of stocks and not upon others, hence the advisability of resorting to budding where grafting is less sure or more expensive.

BUDDING AND GRAFTING APPLES.

Apple stocks are so readily raised from seed that other kinds are seldom employed except when dwarf trees for garden culture are required, then the Paradise or Doucain apple are used instead. The latter are very dwarf or low-growing species, or perhaps varieties, of the common apple, and the sorts worked upon them assume the dwarf habit of the stock, hence the common name of Dwarf, or Bush, apples. Now it is possible to make the apple to grow on quite a variety of stocks, but the three named are considered best for general purposes.

The stocks may be budded in summer or grafted in spring, as standing in the nursery rows; but the method most generally practiced is to take up the stocks in fall and then graft upon the roots during the winter, planting out in spring. Grafting apple stocks in winter affords the propagator an opportunity of increasing his stock more rapidly and at less expense than if he had to depend upon budding or grafting the stocks while standing in the nursery, and the trees propagated in this manner are without doubt fully as good.

PEARS.

Pears may be worked upon apples—any of the species of thorns, (*Crategus*,) mountain ash, *Cotoneasters*, quince, and various other kinds of stocks; but the seedling pear for standard trees and the quince for dwarfs, are now generally employed for this purpose and considered the most suitable. Pear stocks may be grafted in winter the same as those of the apple, but budding in summer is usually the preferable mode, and the same is true when using quince stocks for dwarf trees.

Certain varieties of pears succeed well on the quince stock, while others do not, and we may seek to know why the difference without discovering it. For instance, the Bartlett will seldom form a good, permanent union with a quince stock, there appearing to be only a temporary uniting of the cells of the two; but the Vicar of Winkfield and some others which might be named will take to the quince almost as readily and firmly as upon stocks of its own kind. The discovery that the wood of one variety of pears united readily with the quince, while another would not, led to the introduction of what are termed "double-worked dwarfs," which are produced as follows:—The first season the quince stock is budded with some vigorous growing variety of pear like the Vicar of Winkfield, which is known to form a perfect union with the quince; the next spring the bud, in the usual course, produces a strong shoot several feet in hight. In the latter part of summer or at the proper time, a bud from another variety—say, for instance, the Bartlett—is inserted into the pear shoot about six inches above its junction with the quince. This bud, of course, unites readily with wood of its own kind, and next spring the entire shoot above it is removed and the inserted bud pushes into growth, forming the tree proper. Now in this case we have a quince root or stock, then six inches of a Vicar of Winkfield pear stem, and the remainder, or bearing portion of the tree, is a Bartlett.

These double-worked trees were once quite popular, and are really worth all the cost whenever dwarf pears are cultivated extensively or solely. This same principle of double-working, might be introduced into other fields of horticulture with beneficial results.

PEACHES, PLUMS AND CHERRIES.

Not long since we received an inquiry from a novice in pomology, asking if he could not dig up his peach stocks and root-graft them in winter, the same as practiced with apples. Of course such an experiment would certainly end in a disastrous failure, and no one but a novice would desire to try such an experiment. We prefer using seedling stocks and budding in summer for all the three kinds last named, although grafting plums and cherries can be done quite successfully in our northern climate. Peaches may be worked upon plum stocks and *vice versa*, although it is seldom advisable to do so. There are several distinct species of native plums, all of which may be employed for stocks upon which to work the choice improved sorts. The dwarf Beach Plum (*Prunus maritima*) answers well as a stock for dwarfs, while the Chickasaw and Wild Red plum answer well for standards.

In propagating the cherry by budding and grafting, we meet some natural barriers, which prevent an indiscriminate inter-working of the various species. Of those bearing edible fruit both the foreign and native may be divided into two classes, or sub-genera, one producing flowers in umbels or clusters, and the others in racemes. Now all the species and varieties in either may be budded or grafted upon each other; but the wood of those bearing flowers in clusters seem to have no affinity for those with flowers in racemes. Now if the novice in Pomology keep this fact in mind, he will have no occasion to ask if this or that species of wild cherry can be employed as stocks for certain cultivated varieties. To make this point plain, we will name the principal species in both.

FLOWERS IN CLUSTERS.

The common Garden Red or Morello cherry (*Prunus Cerasus*) and all its various varieties. The English cherry or, as more generally called, Mazzard, (*P. avium*,) the parent of our large sweet varieties. The wild form, or Mazzard, is found growing wild in the hedges and even woods of the Eastern States, the seeds having been distributed by birds from cultivated trees. Wild Red cherry (*P. Pennsylvania*) is a small tree found in rocky woods in the Northern and Middle States. The fruit is small, red and quite acid.

The Dwarf cherry (*P. pumila*) is a small shrub growing only two or three feet high, forming large clumps. Flowers small, white, succeeded by a dark, purplish-black fruit a half-inch in diameter and of a sweetish, rather insipid taste. The roots are of reddish color, covered with numerous buds from which spring many suckers.

FLOWERS IN RACEMES.

Wild Black cherry (*P. serotina*) is too well known to need description, growing to a large tree, the wood of which is extensively used by cabinet makers.

Choke cherry (*P. Virginiana*) is also well known and common almost anywhere in the Northern and Southern States. A small tree or large shrub, with dark, astringent fruit.

Small Bird cherry of Europe (*P. Padus*) is sometimes cultivated for ornament in this country; resembles our Choke cherry, but the racemes are larger and the fruit usually of a lighter color.

Now when any of our readers write to us asking if wild cherry seedlings can be used as stocks for the cultivated sorts, they can see how difficult it is to answer this question unless we knew to what particular species they refer.

THE LADY APPLE.

This beautiful little dessert apple, the *Pomme d'Api* of the French, may often be seen in the windows of the fruiterers' shops in Covent Garden, where its handsome form and brilliant colors never fail to excite admiration. It is by no means a new apple; on the contrary, it was once said to be known and appreciated in the time of Pliny. It is now thought to have been originally a French apple, obtained from a wild variety found in the forest of Apis, in Bretagne. In Normandy it was well known in 1690, and was known as Gros Apis and Long-bois. The fruit of this apple, which should be gathered as late as possible, should be thinned where it is too thick, and, above all, should be as much exposed to the sun as possible, so as to give it color. So well does it adhere to the tree that it will brave, without falling, the strongest winds. This apple should be eaten with its skin on, this having so agreeable a perfume that we can hardly afford to dispense with it. It is largely grown in the United States, and always commands a higher price than any other fancy apple in the market. In this country it would, doubtless, succeed well under orchard-house culture, on the Paradise stock, or in the open air.—*G. in London Garden.*

Prairie farmers should plant wood-lots as soon as they get their farms fenced.

Patrons of Husbandry.

OFFICERS OF THE NATIONAL GRANGE.

BELOW we give an accurate list of the recently-elected Officers of the National Grange, with their respective Post-office addresses. They are elected for two years—until November, 1878:

Master—JNO. T. JONES, Barton, Phillips, Ark.
Overseer—J. J. Woodman, Paw Paw, Van Buren, Mich.
Lecturer—A. B. Smedley, Cresco, Howard, Ia.
Steward—A. J. Vaughan, Memphis, Tenn.
Assistant Steward—Mortimer Whitehead, Middlebush, Somerset, N. J.
Chaplain—S. H. Ellis, Springborough, Warren, O.
Treasurer—F. M. McDowell, Wayne, Steuben, N. Y.
Secretary—O. H. Kelley, Louisville, Ky.
Gatekeeper—Oliver Dinwiddie, Orchard Grove, Lake, Ind.
Ceres—Mrs. Jno. T. Jones, Barton, Phillips, Ark.
Flora—Mrs. Sam. E. Adams, Montecello, Wright, Minn.
Pomona—Mrs. Harvey Goddard, North Granby, Hartford, Conn.
Lady Assistant Steward—Miss Caroline A. Hall, Louisville, Ky.
Executive Committee—D. WYATT AIKEN (Chairman), Cokesbury, Abbeville, S. C.; E. R. Shankland, Dubuque, Ia.; Dudley T. Chase, Claremont, Sullivan, N. H.; Alonzo Golder, Rock Falls, Whiteside, Ill.; W. H. Chambers, Osweehee, Russell, Ala.

MEETINGS OF STATE GRANGES.

WE continue from last week the reports of meetings of State Granges:

Maine.—Annual meeting held in Bangor, Dec. 14-16th, and embraced representatives from nearly every Grange in the State, of which there are 400, with an average membership of 200. The following officers were elected for 1876:—Master, NELSON HAM, Lewiston; Overseer, C. E. Gilman, Houlton; Lecturer, Raymond S. Rich, Thorndike; Steward, E. H. Clement, Newburg; Assistant Steward, O. A. Bowman, N. Fairfield; Chaplain, C. B. Davis; Treasurer, C. H. Cobb, E. Poland; Secretary, J. M. Jackson, Lewiston; Gate Keeper, J. C. Clements, Winterport; Ceres, Mrs. H. P. Ham, Lewiston; Pomona, Mrs. C. E. Gilman, Houlton; Flora, Mrs. J. F. Cornforth, E. New Portland; Lady Assistant Steward, Mrs. J. M. Jackson, Lewiston. Executive Committee:—A. K. Walker, Nealey's Corner; Hermon Sawyer, Durham; J. O. Keys, North Jay; Nathaniel Dyer, Pownal.

Kentucky.—The State Grange held its annual session at Louisville, Dec. 7. Over 200 delegates were present, of whom about 50 were ladies. The State Purchasing Agent, Bro. GUTHRIE, reported that he had purchased for the members of the Order in the State goods to the amount of $300,000 at a saving of $75,000 to the purchasers. The Treasurer reported a balance on hand of nearly $15,000. The officers for the ensuing two years of the State Grange are as follows:—Master, M. DAVIE; Overseer, W. J. Stone; Lecturer, Dr. R. D. Smith; Steward, W. J. Sec; Assist. Steward, D. W. Cooper; Chaplain, Rev. D. J. K. Maddox; Treasurer, J. M. Clark; Secretary, J. Eugene Barnes; Gate Keeper, H. S. Priest; Col. Chas. G. OTIS of Knickerbocker Grange, New York City, addressed the Grange.

Massachusetts.—The State Grange recently closed its annual session at Springfield, after having elected Thaddeus Graves of Hatfield, Master; Henry E. Rice of Barre, Overseer; A. F. Bliss of Blandford, Lecturer; Charles Jones of Deerfield, Treasurer; James Draper of Worcester, Secretary. During the year 35 Granges have been instituted, making 100 in all, and the membership has increased from 2,700 to 4,000.

Colorado.—The State Grange adjourned on the 18th ult., after a very interesting session. Subordinate granges were advised to discuss the proposed amendments to the State Constitution, and the Legislature was requested to make an appropriation for the Centennial Exhibition. Resolutions were adopted in favor of changing the present system of jurisprudence to Courts of Equity or arbitration; forbidding private corporations controlling the water in the rivers and streams.

Knickerbocker Grange.—Several members of this Grange have taken occasion to visit meetings of State Granges—notably Bros. NAUGHTON, Secretary, and REED, OTIS and INGERSOLL. Besides the National Grange, they have visited Iowa, Illinois, Missouri, Indiana, Delaware, Pennsylvania and New Jersey.

GRANGE NOTES AND ITEMS.

THE Arkansas State Grange meets Jan. 24.

THE Virginia State Grange meets in Richmond Jan. 11.

YORK Co., Me., has eleven Granges, all in good working order.

NOTICE is given for an act to incorporate the Dominion Patrons of Husbandry.

THE receipts of the Illinois State Grange for 1875 were $124 000; balance on hand, $12,000.

THE Grange mill at Fairbault, Minn., is acquiring a high reputation for the quality of the flour it turns out.

ACCORDING to the last reports, there are 18 division Granges and 227 subordinate ones in the Dominion of Canada.

THREE Granges and a council of Sovereigns of Industry, in Massachusetts, have started a co-operative store in Holyoke.

MR. A. T. MATTHEWS, lecturer of the Kentucky State Grange, has sold his crop of broom corn to parties in Louisville at $120 per ton.

MR. HENLEY JAMES, master of the Indiana State Grange, favors making all fourth degree members eligible to the Pomona Grange.

A MEMBER of Brandywine Grange, Pennsylvania, and his wife, were the first to subscribe to the Centenial Encampment scheme.

EUREKA GRANGE of N. H., is in a flourishing condition. Its numbers are increasing and they purchase supplies at a discount of from 20 to 50 per cent. on former prices.

THE annual convention of the N. H. State Grange, held at Manchester, last week, was the largest ever held in that State. Nearly all the 72 subordinate lodges were represented.

THE Texas Grange Manufacturing Co. at Kelloyville is turning out cooking and heating stoves, every variety of cast, turning and cultivating plows, and is preparing to manufacture steel goods of all kinds. It is succeeding beyond all expectations.

Domestic Economy.

SPLENDID SUET PUDDING.

OUR Suet Pudding for dinner was so very nice, and gave such general satisfaction, that I send the recipe for the benefit of my RURAL Sisters, as it may be new to some of them. It is particularly nice and convenient for housekeepers, as it will keep nicely a month or two in a cool, dry cellar in earthen jars or a tin box, and a part of it may be sliced off and steamed from time to time as needed—when, with suitable sauce, it will be found as good as when newly made.

Recipe for Suet Pudding.—Take one cup of suet, chopped fine; one cup of raisins, chopped; one-half cup of English currants; one cup of sirup; one cup of sour milk; two even teaspoons of soda. Mix the suet, raisins and currants well into the sirup; then add the sour milk; next the soda, pulverized and well mixed in a handful of dry flour. Stir until it begins to foam, then add flour enough to form a stiff batter. Steam one and one-half hours. For a large family double the quantity will be required, and it should be steamed two hours. Serve hot.

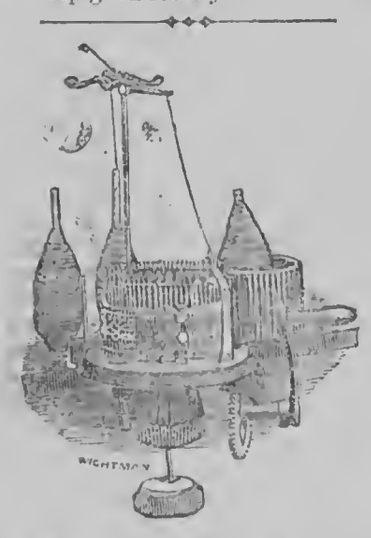
Sauce for Pudding.—One-half cup of butter; one-half cup of sugar; beat these together with one heaping table spoon of flour. Pour into it (a little at a time, stirring all the while,) one pint of boiling water, and let it simmer on the stove a few minutes. Add one teaspoon of lemon extract, and the juice of one lemon or a teaspoon of lemon sugar.—JULIA M. W.

WASHING FINE UNDERCLOTHING.

A LEADING firm, importers and retailers of hosiery goods in Philadelphia, gives the Germantown Telegraph the following directions for washing merino, lamb's wool and silk underclothing, and that paper bears witness to its excellence:—Use one pound of dissolved soap in four gallons of warm water, in which rinse well the articles to be washed, drawing them repeatedly through the hand; wring them as dry as possible, to remove the soap; rinse them again briskly in clean, lukewarm water; wring and stretch them to their proper shape, and dry in the open air if possible. The only effects of rubbing are to shrink and destroy the material; it should, therefore, never be resorted to. The material used in manufacturing silk underwear being an animal product, it is absolutely necessary that nothing but the best quality of soap and warm water should be used. All kinds of washing compounds destroy the nature of the material, giving to the fabric the appearance of poor cotton.

TO DRY FRESH MEAT.

CUT the flesh into slices of from two to six ounces in weight; immerse a small portion at a time in boiling water for five or six minutes, using only just water enough to cover the meat, adding fresh water to keep the liquor up to its original quantity. Lay the meat to dry on open trellis work in a drying stove, keeping the temperature at about 122 degrees Fahrenheit. In about two days the meat will be completely dry, having lost two-thirds its weight. Add a little salt and spice, especially coriander, to the liquor or soup in which the meat was immersed, and then evaporate to a gelatinous consistence. When the flesh is dry, dip it, piece by piece, in the gelatinous matter liquified by a gentle heat, and replace it in the stove to dry, repeating this varnishing and drying two or three times, so as to get the coating uniformly think. Meat thus dried will keep good for a year.



AUTOMATIC KNITTING MACHINE.

THIS is a simple, economical and effective machine, adapted to a great variety of work, and doing it with the least possible care of the operator. It is manufactured by the Franz & Pope Knitting Machine Co. of Bucyrus, Ohio, at the low price of $40. We have not room for a long description, but a little book, giving complete instructions, is sent with every machine. We will this machine to every one obtaining 20 subscribers to the RURAL at $2.65 each, or 40 at $2.15 per yearly copy.

THE BEST YEAST KNOWN.

VIENNA bread is said to be the best in the world. It owes its superiority to the yeast used, which is prepared in the following manner: Indian corn, barley and rye (all sprouting) are powdered and mixed, and then macerated in water at a temperature of from 149 to 167 deg. Fahrenheit. Saccharification takes place in a few hours, when the liquor is racked off and allowed to clear, and fermentation is set up by the help of a minute quantity of any ordinary yeast. Carbonic acid is disengaged during the process with so much rapidity that the globules of yeast are thrown up by the gas and remain floating on the surface, where they form a thick scum. The latter is carefully removed and constitutes the best and purest yeast, which, when drained and compressed, can be kept from eight to fifteen days, according to the season.

SELECTED RECIPES.

A Danish Dish.—One pint of currant juice; one pint of water; half pint of sago; two cups of sugar. Boil all together until the sago is soft. Pour into molds, and set on ice.

Cream Pie.—One cup cream (sweet, and as thick as you can get it), two tablespoons sugar, and one egg. Use one crust, making it the usual way.

To Warm Beans and Succotash.—Put with a little water into a flat dish and cover tightly. Heat slowly, and do not stir while warming, as that will make them messy and pasty. If they are likely to burn, put them where there is less heat. Dish them with a flat ladle or skimmer, so as to stir them as little as possible. A good dish for breakfast.

Aromatic Vinegar.—Concentrated acetic acid, eight ounces; oil of lavender, two drachms; oil of rosemary, one drachm; oil of cloves one drachm; oil of camphor, one ounce. Dissolve the camphor in acetic acid, then add the perfumes. After remaining together for a few days, with occasional agitation, it is to be filtered and bottled for use or sale.

Winter Succotash—This may be made with Limas, horticulturals, garden beans, or white field beans. The latter are seldom used for succotash, but they make it very nicely. The method of proceeding in each case is the same. Boil the beans without soaking until three-fourths done. In the meantime put an equal amount (dry) of dried sweet corn with three parts water, and let it steep on the stove for two hours without boiling, then add to it the beans and let them cook together gently until the beans are done. Serve warm, and do not break the beans.

A Test for Linen Fabrics.—To distinguish cotton when woven into professedly linen fabrics, it is well to know that linen fiber, when dipped in an alcoholic solution of rosolic acid, next in a concentrated aqueous solution of carbonate of soda, and finally washed several times with strong soda, attains a beautiful red color, while the cotton fibers are not dyed. Before testing, the dressing should be washed out of the goods, and a few threads ravelled out on each of the three sides.

Hygienic Information.

WHAT TO EAT.

AN American lady, medically educated abroad, and well acquainted with the habits of the Scotch, English and Germans, recently declared that she thought the three curses of America, and the primary causes of its physical deterioration were eggs, butter and sugar, in the form of cake.

In no country is this poisonous stuff used to the same extent as with us. Infants lay the foundations of future dyspepsia with it before they leave their mother's breasts; children are fed upon it between their meals, to the destruction of all natural appetite; while among schoolgirls, it slays more than all the studies in the world.

The case of hundreds of Scotch students was cited, now become eminent divines, who left home with barely money enough to pay the rent of a poor room, and with a bag of oatmeal on their backs, returning vigorous, strong men, remarkable for their powers of endurance, mental and physical, their food during their years of probation, oatmeal only, cooked by themselves, the bag being replenished from home as often as it gave out.

We use too much food in this country, we mix our oatmeal in the morning with beefsteak, fried potatoes, eggs, chops, fish, corn bread, hot biscuit, and other convertibles in a way which deprives it of all its virtue. Oatmeal must be made the principal dish at breakfast, if it is to have any potency, especially for children, for if there are other and more tempting luxuries, they will not of course choose that, and to eat a little under protest, when the stomach is already full of ill-assorted food, is to add insult to the injury already inflicted upon it.

"Crushed" wheat is winning golden opinions as a fine and healthful article of food, and as it requires three or four hours cooking, it is particularly adapted as a warm dish for "tea" for children, and adults also, in families where the city custom of late dinners is not observed. It is usually made the consistency of oatmeal, or Indian meal mush, with water, and a little salt, and left to "simmer" at the back of the stove or range, between the hours of mid-day dinner and tea, then eaten with new milk only, exactly the same as oatmeal.

REMEDY FOR FROZEN FEET.

THE following remedies, by several different persons are seasonable and we trust will be found effectual by any of our readers who may have occasion to use either. Any one having a better remedy will please send it to the RURAL:

Some one wishes to know what will cure itching of frost-bitten feet of many years standing. Mine troubled me very much every winter for several years, and were so sore that I could wear only a loose stocking and a felt shoe, and was obliged to cut a hole in the other shoe over the large joint, (which enlarged the joint.) I cured them with Cantharides cerate, and have never been troubled since. That was six years ago. I have given it to several persons, and have never known it to fail to cure. Two or three applications are generally sufficient.

To make it—rub into simple cerate as much of the tincture of cantharides as it will hold. Any druggist can prepare it for you. A small box will cost about fifteen cents. Cantharides is made from Spanish flies; *I think* it is a harmless remedy. Rub a little on the feet before going to bed, after bathing them in warm water. The best thing for frozen feet is to make a poultice of grated raw potato and fish oil, and apply to the parts. It never fails. An onion chopped fine and applied as a poultice will give immediate relief in cases of frost-bitten feet, and if persisted in will effect a cure.

Another writer says:—"I have tried almost every thing that could be mentioned, but found nothing equal to a mixture of turpentine and camphor-gum."

THE MEDICINE OF SUNSHINE.

THE world wants more sunshine in its disposition, in its business, in its charities, in its theology. For ten thousand of the aches and pains and irritations of men and women we recommend sunshine. It soothes better than morphine. It stimulates better than champagne. It is the best plaster for a wound. The good Samaritan poured out into the fallen traveller's gash more of this than of wine and oil. Florence Nightingale used it on Crimean battlefields. Take it into all the alleys, on board all the ships, by all the sick-beds. Not a phial full, not a cup full, nor a decanter full, but a soul full. It is good for spleen, for liver complaint, for neuralgia, for rheumatism, for falling fortunes, for melancholy. We suspect that heaven itself is only more sunshine.

"PROGRESS AND IMPROVEMENT."

SATURDAY, JANUARY 8, 1876.

CENTENNIAL PROSPERITY.

The Rural New-Yorker, having entered upon a new year and volume under the most encouraging auspices, sincerely congratulates its numerous readers all over the Continent upon the facts and indications which give promise of an early return of General Prosperity—our candidate for Centennial President—to the People and Country. That view is too rose-colored, in your opinion? Let us examine and decide.

The prevailing sentiment of both the People and the Press seems to be that the Centennial Year, so favorably inaugurated throughout the Union, is not only to restore and render permanent our former unexampled prosperity as a nation, but create and cement a bond of union among the peoples of these States and foreign countries which will insure peace and harmony in the future. And pray why may not such be the result? What we lack most is *Confidence*—in ourselves and in each other. With that, and judicious Economy and Industry, the "good time coming," which has been so long delayed that many have despaired, will surely arrive. Faith and Works will accomplish the desired object and inaugurate an era of prosperity equal to any ever known during the existence of the American Republic—whose career during the past century is unexampled in the history of nations.

The country never had more abundant resources. The farmers and planters are especially fortunate—for, notwithstanding the bad weather and other unfavorable indications, last spring, they have been richly blessed "in basket and in store," and are now really the most independent people on earth. The grumblers and croakers—we trust there are no chronic ones among our readers—should not forget the numerous blessings they enjoy, compared with inhabitants of other lands, where war, pestilence and famine prevail.

Of the unparalleled improvements successfully introduced within a few years—demonstrating the great ingenuity, intelligence and enterprise of the American People—we need not speak in this connection, for are they not patent to "all the world and the rest of mankind?" The invention of labor-saving implements and machinery, by the "Universal Yankee Nation," has alone created a wonderful change in the various channels of Agricultural Production and Manufactures—a change which has not only vastly benefited our own people, but those of foreign countries. The improvements in production, and the great facilities in transportation by both land and water—enabling us to compete favorably in many respects with other nations—are among the blessings vouchsafed, and for which the American People and Nation should thank God, resolving to do all that is needful in the immediate future to promote what has already been inaugurated,—Centennial Prosperity.

Thanks to the hosts of Agents and others who are helping the Rural by introducing it to the notice and support of their friends. We gratefully appreciate the efforts of all who are kindly seconding our efforts to benefit the Ruralists of America.

INDUSTRIAL PROGRESS IN 1875.

An observant philosopher has shrewdly remarked that, "Happy are the people who have no history." Looking backward over all preceding and barbarous ages, the saying is no less wise than witty. So long as history concerned itself only or chiefly with war, devastation and the misfortunes of mankind, its absence was for any people matter for congratulation. Looking forward to the Golden age, not far distant, we shall see history concerning itself chiefly with the more important yet less sensational matters which promote progress in the arts of peace and industrial advancement. The people of the United States are to celebrate this year the Centennial anniversary of their Independence; but it is safe to say that we should not think of making a World's Exposition of progress during the past century if we had only the most notable events of our history, our wars with England, Mexico and among ourselves, to show for it. The inventors of the cotton gin, of the reaper and mower, the sewing machine, the electric telegraph and of the innumerable devices for promoting civilization by bringing men nearer to each other and lightening their burdens, will make a prouder record in our coming Centennial than any mere military heroes. War for any cause is a public calamity. It may be the alternative of a worse evil and therefore excusable, but it always needs excuse. Only industrial progress benefits all, and is an unmixed good.

During the year just closed there has been no one achievement which towers far above others. Progress has been made, but it has been mainly in minor details rather than in single brilliant strokes. Despite the "hard times" which have affected all kinds of commercial and speculative business, the producing interests of the country are probably to-day more firmly established and more prosperous than a year ago. The farmers and other producing classes are probably also in better condition. Earnings have been small; but economy has been general, and the savings from small gains are more important to the individual or community than great increase in profits. Notwithstanding the general lack of astounding discoveries or inventions, the year has not lacked many of great importance, and which, in an age of fewer industrial triumphs, would have created a great deal of interest and excitement. It cannot be doubted that the aggregate of these lesser inventions cannot fail to be of great and increasing importance to the cause of human progress and improvement. An invention once made is for all time, and what now seems of the slightest importance, working through centuries and ages yet to come, may affect for good millions and millions of men and women yet unborn.

FARMERS' CLUBS.

Conrad Wilson, an esteemed contributor to our own pages, writes to the Christian Union:—"In view of the conceded usefulness of Farmers' Clubs and of their growing importance, it has occurred to me to submit for their consideration a suggestion that will perhaps be deemed worthy of attention. There are various and important considerations tending to show that many advantages would probably result if the Clubs of the whole country were connected together under a general organization. One obvious effect of such a movement, of course, would be that the countless local associations now scattered through the country, unnumbered and unknown, would be brought into fraternal union and concert of action that would largely increase their efficiency and the value of their influence on progressive husbandry. It would also tend to the mental and moral as well as social improvement of the present isolated societies, and would make each Club an object of greater interest to farmers and to the public, thereby increasing their membership and their sphere of usefulness. There would be no reasonable ground for suspicion of political motives, as the State and National organizations would simply reflect the sentiments and purposes of the Clubs from which they spring. The honorable rivalry at present existing between the Granges and Clubs would still remain the same as now, for the new movement would not need to introduce any new aims or elements of discord, and would make no essential change in the present character of the Clubs. It would simply enable them, by concerted action, to work out and more effectively promote the progress of husbandry and the prosperity of the country."

We believe the above "hits the nail on the head" in proposing to make the scattered Farmers' Clubs more efficient and useful. Some connecting links, to give coherence and effectiveness to farmers' organizations, would utilize for the farmers' benefit a great deal of power now wasted. It is this union of numerous local Granges in State and National organizations that has given the Order of Patrons of Husbandry its unprecedented success. To this we would also add one other feature, *i. e.*,—the presence of wives and daughters in Grange meetings. Probably the greatest advantage of the ritual consists in the fact that it necessitates the presence of women at Grange meetings. This advantage, together with that of a general organization through the country, can just as well be secured by Farmers' Clubs, and in many localities where strong prejudices exist against secret organizations, the open Clubs will probably have the preference. Each will have some advantage commending it to different habits of thought. With two classes of successful organizations, one open and the other secret, and each working for the farmer's welfare, the objects of both will be pushed forward to speedy accomplishment. We heartily thank Mr. Wilson for the timely and practical suggestion he has made, and will do all in our power to further its adoption.

PROPOSED POSTAL REFORM.

Postmaster Filley of St. Louis has suggested to the Department a change in the postal laws which seems to us very sensible. Newspapers and other periodicals sent to regular subscribers and news-agents are now reckoned as second-class matter and charged for at pound rates, while sample copies of newspapers, prospectuses, display posters, and similar articles issued by publishers and mailed generally to the same offices and at the same time with their regular subscribers' copies, are counted as third-class matter and charged for at transient ounce rates. This discrimination causes so much annoyance both to postmasters and publishers, and yields so little to the postal revenues, that Mr. Filley proposes that it should be abolished and all periodicals, with posters, prospectuses, sample copies, and other matters connected with them, rated as second-class. There will have to be a revision of the postal laws at this session, and we commend this common-sense suggestion to the consideration of Congress.—*N. Y. Tribune.*

There is no doubt that such a change would greatly simplify the postage business; but why not go a step further and make a uniform rate for all mailable matter, as proposed by Mr. Vick and quoted in the Rural New-Yorker December 18? Mr. Vick is himself one of the largest patrons of the Post-Office through his extensive business, and his suggestion is the result of much experience and a thorough knowledge of what the people need and what the Government can profitably furnish.

RURAL NOTES AND QUERIES.

The Tramp Nuisance.—The turning away of some hundreds of thousands of men engaged in industrial pursuits by the suspension of mercantile establishments within the past two years, has been the means of setting afloat a large population who go through the country ostensibly looking for work, but really begging or stealing whenever they can get a chance. These classes are called "tramps," and an intolerable nuisance they have become. Many of them are the natural result, not of "hard times," but of a dislike of honest industry learned during the flush times during and following the war, when a greater proportion of the people than ever before lived without work. Wages have naturally and properly declined somewhat from those flush times, but there is something for every one to do, and better pay than our grandfathers and great grandfathers were glad to take for harder toil. Nine-tenths of the tramps infesting the country are not looking for work, but for some nice, easy job that will not require much exertion and will give big pay. In the meantime, these fellows cost vastly more to maintain than the majority of respectable members of society. They prowl through the country, acquiring and disseminating vicious habits, burning barns, houses and other buildings wherever they can get a chance. The two recent fires, nearly destroying the entire village of West Avon, N. Y., were both probably started by tramps, and hundreds of other mysterious fires have a similar origin. It is high time that these outlaws were set to work, if only for the sake of keeping them out of mischief. The County of Orange, N. J., has given a good example in this respect. Last year the authorities housed and fed 18,000 of these traveling vagrants, and the news spread so rapidly that the number bade fair to be quadrupled. The coming year a new tack is to be followed. Each town is to have accommodations for giving able-bodied vagrants plenty of hard work for the benefit of the town while they remain in its borders. Judicious improvement of roads is a work which might profitably employ a good deal of tramp labor, and this suggestion is appropriate for most Rural districts. If some such practical measure as this is adopted, the business of "looking for work" as a permanent means of getting a living will speedily come to an end.

The Rural and the Centennial.—In remitting for a club of subscribers for 1876, Mr. Wyman Elliott of Minneapolis, Minn., writes:—"We are a devoted little band of admirers of your paper, and I have acted as agent so long that it comes natural to send for the Dear Rural every year. I have been a reader of its contents for the past twenty years and have most of the volumes complete. I hope you will give a good summary of the Centennial as it progresses, with all that is of interest to the *producing classes*. Cheap Transportation is what we of the West demand at the present, and he who gives us that will long be remembered by the millions of the great Mississippi Valley."

—Our friend, and others who have recently written us on the same subject, will observe that we anticipated their wishes by opening the Rural for 1876 with a department entitled "The Centennial." This we purpose to continue, with a view of chronicling the leading features of the great anniversary as they transpire or are announced. We hope to render "The Centennial" the most interesting feature of the Rural, while we shall neither forget nor neglect matters of interest to the producing classes—prominent among which we reckon Cheap Transportation.

Sugar from Grapes.—Some of the Pacific Coast journals are devising means for utilize their surplus grape crop by converting its sweetness into sugar for the market. The Pacific Rural Press exposes the fallacies of this idea as follows: "There is not a particle of crystallizable sugar in the grape. What is known as "grape sugar" is the same substance as that which is made from corn or starch, and when so made is called glucose, which is largely used in the manufacture of wine, etc. The form in which it approaches nearest to sugar is the appearance it sometimes presents on raisins, which is known as "grape sugar," an altogether different article from the sugar made from cane or beets. Grape sugar can be made much cheaper from starch than it can from grapes; and in fact, is largely manufactured from that substance for commercial purposes. The question of what to do with our surplus grapes is not yet solved."

Kind Words from Ruralists—Are daily reaching us from all sections of the country, which reminds us of the trite but wise adage, "Beware when all the people praise thee." Let us see. Here is a subscriber in Steuben Co., Ind., (Mr. Henry B. Dodge) who writes:—"You may just as well put my name on your book for life, or at least as long as my wife and children live, for 'there is no use talking'—they have got to have that paper if all the others go by the board." Another says:—"Having taken the Good Rural for twenty years I cannot drop it, inasmuch as it is now better than ever before. God bless you, and all who contribute to the institution. You are making the best paper of its class in the universe, and ought to be abundantly rewarded—for people who read and heed the Rural's pages cannot but be benefited."

We must omit, or defer, what many say, but here is an item from Fanny D. Boylan of Allegany Co., N. Y., (who remits for a handsome club,) which should be duly chronicled. She writes: "Please don't think that the Agent you named is the only one who does a good thing for you. I have been advancing money for Rural subscribers for years. I advance the money for half of this list. Pray tell us when and what is going to make the times better." The "good times" will come so soon as people are saving, economical and live within their means. In the language of a Boston lady, who has successfully managed a large estate for many years, "so long as the people of this country continue to eat roast beef when they have only money enough to pay for salt mackerel they will have and deserve to have hard times."

The Wheat Prospect in England for another year is very poor. Much of the seed grain rotted in the ground from excess of wet and cold, and what is left has made a poor growth. It is not possible that the crop of 1876, under the most favorable circumstances hereafter, can be an average one, and bad weather may make it a very light one. The rainfall in the United Kingdom was, in September, 2.66 inches; October, 4.22 inches; and in November, 2.97 inches; or, in three months, 9.85 inches, of which about one-half, or 4.22 inches, was during October. This heavy rainfall has prevented the sowing of fall wheat on heavy soils, and the Mark Lane Express says there is a wide acreage unsown with wheat, leaving the agriculturist to the uncertainties of spring sowing.

The Rural's Title Page and Index, issued on a separate sheet at close of last volume, was a "new departure" which is highly appreciated, judging from the commendation of it by several correspondents. It was only an augury or foretaste of what we propose to do for our readers during the Centennial Year—in return for which we trust all true Ruralists will extend to this Journal such influence and support as it may in their judgment be entitled to upon its merits.

RURAL BREVITIES.

Specimens, Premium Lists, &c., are sent free to all disposed to help the Rural.

The Centennial Year ought to be a good one for farmers, and will be if they do their duty.

Show the Rural to your friends and invite them to subscribe for the fifty-three numbers of 1876.

Officers of Agricultural Societies, Clubs, etc., will please send us the reports of their annual meetings.

The Rochester Business University (Prof. L. L. Williams, Pres't,) has just issued its Thirteenth Annual Circular and Catalogue in a beautiful pamphlet, worthy the Centennial Year.

A Texas subscriber to the Rural writes:—"To show you how we live down here I will give you a statement which speaks for itself. The assessed value of my property is $500, and my taxes on the same $38."

We learn that C. H. Dann, of Warsaw, N. Y., is preparing a lecture to be read before Farmers' Clubs and Granges. The title is "The Light Bringer," and we assure farmers within reach of one of his lectures that they will miss a good thing if they fail to hear it.

No sooner had we fairly recovered from the shock produced by the news of the earthquake in Virginia than we were again thrown into a state of nervousness by the appearance in our Publication Office of the ubiquitous Gen. Jones of Binghamton. We at first feared that he had come to talk Scales to us; but as it only turned out to be a friendly call, we soon regained our self-possession. We wonder if Jones intends to supply all New York City with Scales? He certainly did not come here for nothing.

BUSINESS NOTICES.

BRIDE & CO.,

769 Broadway, N. Y., want agents for the best money-making article in the world. Send for particulars.

For Throat Diseases and Affections of the Chest, "*Brown's Bronchial Troches*" are of value. For Coughs, Irritation of the Throat caused by cold, or Unusual Exertion of the Vocal Organs in speaking in public or singing, they produce beneficial results.

WINTER WAIFS.

THE FACE OF NATURE.

As maidens who have passed their prime,
As beauties who have seen their day,
To cover up the tracks of time
And hide the russet of decay,
Puff powder o'er their faded roses,
Those tawny traces time discloses;
So, in the waning of the year,
When, ribbed and wrinkled, brown and bare,
Our Mother Earth feels age draw near,
She makes her face with snow-flakes fair.

[*Harper's Bazar.*

BEYOND EARTH'S FROST.

WHERE are the flowers? where the leaves?
Where the sweet zephyrs' gentle breath?
Where mellowed fruits and golden sheaves?
Dead, dead; all icy bound in death!
Is Love, too, dead? Hence, needless pain!
Love only sleeps to wake again.
Love dead? Ah no, not so with Love!
Love only dies to live above. [*Ennis Graham.*

LOVE LASTS THROUGH SEASONS' CHANGE.

OH, what if the snows are white and cold,
And the summer's bloom is over!
O, what if the roses blush no more,
And the frost has killed the clover!

Let us turn to the winter a smiling face
And welcome the pale new-comer;—
Isn't love as deep, isn't life as sweet,
As it was in the by-gone summer?

[*Mary F. Williams.*

The Story-Teller.

OUT OF THE STORM.

BY A NEW CONTRIBUTOR.

IT was a cold, dreary night without. The wind blew in wild, heavy gusts, as though it reigned a king. Men hurried on, with heads bowed and thrust forward to cut their way through the storm; little children slunk under the protecting shadows of doorways and such rude shelter as could be found; while poor, wretched women braved the horror of that terrible night from dire necessity. One among them—a pale-faced creature, with a look of mortal terror in her countenance, and who seemed to have known more cheery times—lifted her head from time to time, scanning the faces she met in an anxious, questioning way, that seemed to meet with no response from the passers-by.

At last, as though she felt it useless to hope longer, she turned aside to wait under the princely eaves of a large church. To wait! as we all come to do when the flush of youthful expectancy has passed out of our lives. "He will not come; perhaps the weather is too severe, yet it could not keep *me* within doors,' she murmured, desolation and weariness creeping over her face; "and then there remains but one thing to do, and the sooner that is done the better it will be for me; but oh, it is so hard to beg! Only twenty-five, alone, without friends, and, what is far more necessary—money!"

She started forward to meet the glance of a man with a kind pleasant face, gentle almost as a woman's. She noted it even then; she remembered it through all the years that came after. "Sir, I am starving. For the love of Heaven, give me enough to buy a single loaf of bread!"

He was a generous man, as men go—one who gave largely to charitable institutions—and his name stood among the first on the church-list; but he was a man who knew nothing of real poverty, and withal he *did* know how many of the refuse of society obtained a livelihood by begging. So he passed by—as others had done. Suddenly out of his memory crept the words, "Inasmuch as ye have done it unto one of these ye have done it unto me."

Back through the rain and slush he made his way to find something buried under a heap of clothes. He touched it, but there was no movement; he spoke and tried to push a bank note into the open hand, but the woman lay where she had fallen apparently dead.

"What a brute I have been! How could I have forgotten so soon!" he spoke aloud, and the only answer he had was from the wind and rain. A policeman passing on his round was hailed, a carriage called, and he lifted the inanimate form in his arms, saying to the driver, "No. 105 Arlington Place. Drive fast, and I double your fare."

"I wonder if she will die; if she does it will seem like a just retribution for that other." Then a tear came into the eyes and fell on the fair face of the girl. She was still unconscious, but a moment after and his home was reached.

"HELEN, I've done an odd thing to-night; picked up a woman on the street and brought her home with me; the why and wherefore I have not attempted to analyse. Get her to bed, send FRANK for Dr. GREY, and then let us have dinner, for I am hungry as a wolf, and after a fashion unnerved. How long is it since—since that time, HELEN?"

Mrs. ARNOLD was not a young woman, but there was a look in her sweet, beautiful face, that age alone had never brought—a look that told of some grief that had been wrought by her own hand—some act which was now irretrievable, but which she sought to atone for, in every thought and word and deed. She was a proud woman, but now her pride was all forgotten, and her voice trembled and her lips quivered as she answered, "It will be ten years the sixteenth of this month, HARVEY dear;" then hesitatingly, "why, have you broken the silence to-night?"

"I hardly know, but if he were not dead, I should believe that in some way news was coming to us of our lost ones; yes, *both*, HELEN—after all these years."

An hour later a servant entered the room, and announced "Dr. GREY." Mr. ARNOLD rose to meet him, while his wife extended her hand, with, "Well, Doctor, we are not in need of your services, but HARVEY has concluded to open a hospital for the poor, aged and infirm, and has desired to obtain your assistance as head physician—with an opening case up stairs."

"Mrs. ARNOLD, I wait your pleasure, refusing for the present all the hospitality you offer here below."

Speaking in the pleasant, gracious manner that people use when performing any act of charity which does not at all interfere with individual comfort, Mrs. ARNOLD and the physician passed up the stair-case into a bright, cosy room, where they were greeted by the cheerful warmth of a coal fire, the soft, subdued glimmer of gas lights turned down. On the bed lay the woman they had come to see, thoroughly restored to consciousness, but with a brilliant color on the cheeks that seemed to betoken fever.

Dr. GREY looked grave as he held the small, wasted hand in his, and counted the beating of the pulse. "Too rapid," he said, under his breath, "No, you must not talk, but remain perfectly quiet; rest is what you need. You are in good hands, and to-morrow, if you are better, you may tell all that you have on your mind."

There was an air of refinement about this waif that even fastidious Mrs. ARNOLD noticed; and she saw the look of gratitude that welled up from the depths of the deep, dark eyes, though the lips uttered no word. Bending over, she whispered, "Wait until to-morrow. The doctor thinks you require rest, and I dare not infringe upon his orders. ELLEN will remain with you, and you may be assured that we feel a deep interest in your welfare. Good night; try and sleep."

"Give her these powders every two hours," said the doctor, and then he passed out of the room.

How often we go to meet our fate without knowing it. The things we look for, the sweet anticipations of life slip, oftentimes, away from us, one by one. We know not where they have gone, or why, but we do know that where there was joy and hope, naught lives save desolation! And there are others that come down like GOD's white-winged angels, and rest, and help, and lift us up, and thus the odd things are made even, and the rough corners rounded and made beautiful.

Mrs. ARNOLD was true to her word, and when the light of another day had won the world back to her beauty, she looked upon the young girl's face and knew that she would live. Then she formed after the woman fashion—a life that should be redolent of good works, and rich in faith and love. "We will take her home to our hearts," she thought. "I am sure she is as fair within as without; the face is almost always an index of the soul. She will not disappoint us, I am sure."

She was very willing to listen to the stranger's story. Moreover, she was, like her husband, charitable, and there was a story in *their* lives—a sad, very sad one—that they never referred to from choice. The silence in regard to their "skeleton" had been unbroken for years until the previous night, when her husband had put the question that had brought back the old ache in her heart.

"You are very much better, almost well, but I intend to keep you in bed to-day. 'An ounce of prevention is worth a pound of cure,' so the old proverb says, and I believe in it. By-the-by, what shall I call you?"

The girl's voice was low and sweet, as she replied: "My name is GRACE ARNOLD, and I have been married ten years."

Mrs. ARNOLD started forward: "What did you say—GRACE ARNOLD? Why—" and then she stopped, saying only, "go on, I am listening."

"I was only fifteen when I married, and I had never known trouble. Father and mother denied themselves many comforts in order that I might be educated. They were so good to me—taking all the rain of life and leaving me the sunshine. One summer, when I came home to pass my vacation, I met FRED ARNOLD, and soon I came to love him, to long for his presence, to miss his pleasant words and little attentions. The idea of marrying him used to cross my mind from time to time, but I lived too entirely in the present for it to prove a source of anxiety.

"At last—I remember the time so well—he told me that he must go away, but before he went there was a story he must tell me, and my answer would influence his whole future for weal or woe. How sweetly the birds sang that day; how fragrant the flowers were; but none of the precious gifts of nature were to be compared with this great benison of love that had come down into my life. Then he told me all about himself. His father was a rich banker, but very proud, and my darling feared that he should have little to offer save his heart and willing hands; would I be satisfied with them?

"A week from the time we said good-by he returned to claim me. He was very honest, telling me plainly that his father had erected a barrier between them that could not be broken down this side the grave. We were married a month later, and he brought me to Philadelphia, where we were left to fight the battle of life as best we could. Two years after a baby boy came to us. How glad and happy I was! FRED wrote to his father, but after some time an old friend sent word that the family had gone abroad and their whereabouts was unknown. My baby remained only ten months, and then GOD took him."

The girl's eyes were dim with tears, and her voice failed for a moment. The figure in the chair bowed her head lower; then the story went on. "Things went against us after that time. My husband lost his position and I could not aid him, my health was so wretched. One night he came home and told me that he had received an offer to go West, and if I were willing he would go out there first, as he did not want to take me into a wilderness. In a month he should be back, at the utmost. Days and weeks passed on, and I heard nothing. My money was nearly all gone, so I was obliged to leave the comfortable boarding place where he left me and rent a little room in an obscure part of the city. Then I tried to find a position as seamstress, but no one would engage me because I came without any kind of recommendations and I had no friends to whom I might appeal. Two days ago I heard, in an indirect way, that if I would be in a certain place at seven o'clock I might hear something of my husband. It was my last hope, and I clung to it as I have to the only thing that remained—my wedding ring. I went and waited for more than an hour, but no one came, and then the knowledge that it was a cruel piece of deceit—may GOD forgive the author of it! After that I wandered up the street, knowing that unless I begged I must starve. I asked and was refused. Then I remembered nothing more until I opened my eyes in this room and fancied I was in Paradise. This is all I have to tell."

Mrs. ARNOLD's face had grown whiter and whiter, and her hands were clasped in an agonized manner, showing that she was undergoing some terrible suffering. She looked up full in the girl's face. There was an indefinable something in the eyes of the elder woman that caused the other to hold her breath and say: "Did you know him?" For answer Mrs. ARNOLD crept nearer and nearer, until the young girl's head was pillowed on her breast, while, amid sobs and tears, she said: "GOD has forgiven me, at last! Oh, my child, my child!"

Ten days later a young man in a Western town might have been seen busily writing what appeared to be an important document. From time to time he referred to some papers that lay before him on the desk. His face bore the impress of a subdued sorrow and heroic endurance—such an one as we see a dozen times in the course of a whole life, but when once seen is never forgotten.

"FRED, does this concern you? HARRY ran across it in the New York Herald and brought it over to me. I hope it is good news, old fellow."

"IF FREDERICK ARNOLD will send any tidings of himself to No. 105 Arlington Place, Boston, he will hear of something to his advantage. Any information regarding this gentleman will be richly rewarded."

"I am off on the 4.30 train, HALL. It is news of my lost GRACIE. Good-by. We will not forget! Expect me back any day. Will telegraph immediately."

"GRACE, darling, I have learned to believe in the compensations of life. I sought you everywhere, but no one knew anything about you, and at last I went back, having nothing because I had lost you. Little did I think in the far-back days that my little wife would bring me back to my kindred, Out of the Storm."

GEN. ISRAEL PUTNAM.—EVENTS IN HIS LIFE ILLUSTRATED.—(SEE NEXT PAGE).

WHAT a glorious world this would be if all its inhabitants could say with Shakspeare's shepherd, "Sir, I am a true laborer. I earn what I wear. I owe no man hate, envy no man's happiness, glad of other men's good, content with my farm."

WORDS before blows.

IDLE words are fast in growth.

NO legacy is so rich as honesty.

MANY men have more hair than wit.

THE empty vessel makes the greatest sound.

GEN. ISRAEL PUTNAM.

SCENES IN THE LIFE OF A RURAL HERO.

Some names in history have a peculiar fascination for mankind, and are destined to perpetual remembrance, regardless of all intrinsic merit of their owners. It is mainly the names of men who sprang from the people and lived with the people that will enjoy this immortality. Not that these men are destitute of merit. On the contrary, they are universally men of the strongest native character, more often without scholastic advantages than with, whose heroism seizes upon the imaginations of mankind and makes their lives immortal. Holding no titled or official station, these men are remembered ages after the horde of Governors and Senators, and Presidents even, may have been forgotten. It is pretty safe to say that five hundred years hence every school-boy will know the story of Israel Putnam and the wolf, while as for our Presidents even, excepting Washington, Jefferson, and may be a few others, they will be as indistinguishable almost as the names of unnoted men and women who lived, suffered and hoped five hundred years ago.

Israel Putnam—of whom we give a portrait and some scenes from his active life, was a farmer and the descendant of a long line of farmers in the province of Massachusetts. Born in Salem, January 7th, 1718, he was one of twelve children who crowded the farm house of his father, Capt. Joseph Putnam. The old house is still standing and the object of much curious interest by numerous visitors. It was a few years ago occupied by the grand-nephew of the Revolutionary veteran. Reared in an era of large families, young Israel could not find much time nor opportunity for school advantages. He distinguished himself instead in athletic sports and adventures, one of which is thus related:

Young Putnam's first daring exploit was in attempting to get a bird's nest attached to a slender limb at the top of a tall tree. He walked out on the limb below, but just as he touched the nest and exclaimed, "I've got it—it is mine!" the limb broke, and he fell till he caught on another limb by his pantaloons, where he hung, head downwards. Hanging thus, where he could get neither up nor down, in a position where death must come in a few minutes, he called to a boy in the frightened group below to shoot off the limb with his rifle. After some hesitation he did this and young Putnam fell to the ground somewhat bruised. Determined not to be defeated, a few days afterwards he returned to the tree alone, and with much difficulty secured the nest, which he brought to his companions in triumph.

At the age of 21 Putnam married Miss Hannah Pope, and settled down as a farmer in the newer and more fertile farming land of Pomfret, Conn. In a few years, by good management and hard work, he made quite a competence. The new country was, however, much troubled by a wolf whose depredations none of the townsmen had been able to avenge. Putnam had a fine flock of sheep and on one night he lost seventy. Starting with some neighbors Putnam tracked the she wolf to a cave in the rocks, followed her, and as he saw the beast's eyeballs glaring at him, shot her and dragged her out to daylight. This adventure which, with a less daring hunter, would have been foolhardy and dangerous, seemed to Putnam only a matter of course. It gave him an established reputation among his fellow farmers, and afterwards in the army caused him to be generally known as "The Old Wolf."

Putnam was a man of great personal strength, and on one occasion twisted the tail of a vicious bull around a sapling tree, holding it firmly in one hand while with the other he chastised the animal so that it was ever after submissive.

As a matter of course, Putnam took an active part in the French and Indian wars which preceded the Revolution. His skill in adapting simple means to achieve his ends seemed almost miraculous. On one occasion, while some English troops were attempting to take Fort Oswegatchie, two French vessels blockaded the river and prevented them. Putnam offered to capture the vessels in the darkness of night. Taking a few picked men in a boat, they proceeded with muffled oars, with beetle and wedges, to the vessel. Putnam drove the wedges under the rudder so firmly that it could not be moved, and before the trick was discovered the vessel was drifted ashore and surrendered without firing a gun. The other vessel, seeing the fate of her companion, followed and became a prize.

During the French Wars Putnam went through a multitude of hair-breadth escapes, showing that he bore "a charmed life." During the nine years preceding the Revolutionary War Putnam was a hard-working and, for those days, very progressive farmer. He paid particular attention to the improvement of stock, and especially of cattle and horses. News of the battle of Lexington reached him when plowing in the field. Leaving his oxen on the furrow for some one else to loose, the veteran of ten years' service mounted his horse and hastened to the front. His beloved wife had died some years before, and with no home ties to interfere with patriotic duties, no man was more enthusiastic or did better service during the years that tried men's souls. He was older than most other Revolutionary heroes, and crippled by hard service he retired at the close of the war to spend the remainder of his days on the farm. His military experience and his native force of character brought him rapidly to the front in the Revolutionary War, and he rose to be the Senior Major General of the Continental forces under Washington. For eleven years after his retirement he lived on the farm, and at last died respected by all, and with a name and fame which will grow brighter with the passing of time.

One incident represented in our illustration, not noticed in the above sketch, is Putnam's celebrated escape when pursued by his enemies—riding on his favorite horse down a steep declivity where none dared follow. The bullets fired failed to injure him, in harmony with the mysterious and miraculous providence which always kept him from danger.

A CONNUBIAL CONTROVERSY.

The bolt in the back door had needed replacing for a long time, but it was the other night that Mr. Throcton had the presence of mind to buy a new one and take it home. After supper he hunted up his tools, removed the old bolt and measured the location for the new one. He must bore some new holes, and Mrs. Throcton heard him roaming about the kitchen and woodshed, slamming doors, pulling out drawers and kicking the furniture about. She went to the head of the stairs and called down:

"Richard, do you want anything?"

"Yes, I do!" he yelled back. "I want to know where in Texas is that corkscrew."

"Corkscrew, Richard?"

"Yes, corkscrew, Richard! I've looked the house over and can't find it."

"Why, we never had one, Richard!"

"Didn't, eh! We've had a dozen of 'em in the last two years, and I bought one not four weeks ago. It's always the way when *I* want anything."

"But, you must be out of your head, husband," she said as she descended the stairs. "We've kept house seven years, and I never remember of seeing you bring a corkscrew home."

"Oh, yes, I'm out of my head, I am!" he grumbled, as he pulled out the sewing machine drawer and turned over its contents. "Perhaps I'd better go to the lunatic asylum right away."

"Well, Richard, I know that I have never seen a corkscrew in this house."

"Then you are as blind as an owl in daylight, for I've bought five or six. The house is always upside down, anyhow, and I never can find anything."

"The house is kept as well as any of your folks can keep one!" she retorted, growing red in the face.

"I'd like my mother here to show you a few things," he said, as he stretched his neck to look on the high shelf in the pantry.

"Perhaps she'd boil her spectacles with the potatoes again," answered the wife.

"Do you know who you are talking to?" he yelled, as he jumped down.

"Yes, I do."

"Well, you'll be going for York State, if you don't look out."

"I'd like to see myself!"

"Look out, Nancy."

"I'm afraid of no man that lives, Richard Throcton."

"I'll leave you."

"And I'll laugh to see you go."

Going close up to her he extended his finger, shook it to emphasize his words, and slowly said:

"Nancy Throcton, I'll apply for a divorce to-morrow. I'll tell the judge that I kindly and lovingly asked you where the gimlet was, and you said we'd never had one in the house, which is a bold falsehood, as I can prove."

"Gimlet," she gasped.

"Yes, gimlet."

"Why, I know where there are three or four. You said corkscrew."

"Did I?" he gasped, sitting down on the corner of the table; "well, now, I believe I did."

"And you went and abused me like a slave because I wouldn't say a gimlet was a corkscrew," she sobbed, falling on the lounge.

"Nancy," he said, tenderly lifting her up.

"Oh, Richard!" she chokingly answered.

"Nancy, I'll go right out of doors and kill myself."

"No, you needn't—I love you still, only—only—you know a gimlet is not a corkscrew."

"It ain't—it ain't, Nancy; forgimme and lets be happy."

And that house is so quietly happy that a canary bird would sing its head off if hung up in the hall.

NEWARK LITERATI.

A correspondent of the Boston Gazette writes: There are quite a number of well-known literary people living in Newark, N. J., although there never was a city that showed less evidence of culture than that. Nothing ever draws a crowd but a prayer meeting or a circus. The best singers and the best actors may go there, but seldom make enough to pay their hall rent. Of literary people living in that manufacturing town perhaps the most widely known is Marion Harland. This popular author is Mrs. E. P. Terhune to Newarkers, and she is the wife of an equally popular clergyman of the Dutch Reformed Church. Mrs. Terhune is a sort of Lady Bountiful, and is at the head of almost every charitable undertaking in Newark. She makes no fuss or bustle about what she does, but goes quietly about her work, as though her books did not sell by the 50,000. From her "Common Sense in the Household" she has an income of $2,500 per annum. That is common sense worth having. If her novels do proportionately well she is in a fair way to become rich. Mrs. Terhune is a plain, modest sort of a woman, a devoted wife and a sincere friend.—She has been very ill all summer, but is now better.

Mrs. Mary Mapes Dodge, the editor of St. Nicholas and the author of "Hans Brinker," lives on the old Mapes place, just outside of Newark. This was the home of her father, Professor James J. Mapes, and is the great summer visiting-place of some of our most distinguished literary people. It is a charming place to visit, and is one of those comfortable country homes that were built before the days when ground was so scarce that all houses and public buildings had to be shot up into the air, instead of resting firmly upon the earth. Mrs. Dodge is a widow and has two sons. One of these young gentlemen inherits all his grandfather's inventive genius, besides being a practical worker and the right-hand man of John Roach, the great ship-builder. The other, the younger, has just left Rutgers College, where he had a brilliant career. Mrs. Sophie Mapes-Tolles, who has an enviable reputation as an artist, makes the old homestead her summer quarters. Mrs. E. C. Kinney, the mother of Mr. E. C. Stedman, and herself a well-known poet, has her home in Newark. Mr. Stedman lived in Newark up to within a couple of years, and might have been seen any day in the week going to and fro on the cars, discussing the rise and fall of stocks with other brokers, or a Greek tragedy, if he could get the right sort of an auditor.

Dr. Abraham Coles, author of "The Evangel," and the thirteen translations of "Dies Irae," is a practising physician in Newark. Dr. Coles is one of the most learned Latin scholars in the country, and as a poet he ranks nearer such men as Heber, Jeremy Taylor, and that class of minds, than anything more modern, and, I was going to say, superficial. His hymns and religious poetry are not only beautiful, but they possess a quaint simplicity that is unfortunately of the past. Amanda M. Douglass, who is well-known as the author of popular Sunday school books and mild novels, lives at Woodside, a suburb of Newark. Virginia F. Townsend, who at one time had a reputation as widespread and somewhat similar to T. S. Arthur, is also a Newarker, or was up to a recent date. Edmund Kirk—Gilmore is his real name—is a Newarker. His literary work is not very high, still his book "Among the Pines" was widely read and favorably received.

NEW WAY TO GET A HUSBAND.

A reliable correspondent to the Reading Gazette says: "It is none of the world's business who the lady is or in what part of the county she resides. The facts are sufficient to show how a lady, vulgarly called an old maid, got a husband, and one that may prove himself worthy of her. Six months ago a tramp came to a Berks county farm house and asked the daughter for food, and it was given to him. He was considerably worse for wear, yet his modest demeanor and gentlemanly bearing attracted the attention of the family. He was given work on the farm and shortly became a favorite. He was sober, industrious, genteel and intelligent. Gradually the daughter took a liking to him and she loaned him money from her own purse to purchase clothing with. She encouraged him to keep himself well dressed, and in a short time the farmer saw that his man of all work had suddenly become a fine looking and earnest suitor for his daughter's hand in marriage. It was at first refused, but the only child cried to her mother, the mother interceded, and finally the stern parent gave his consent. It was virtually a romance in real life. The marriage took place, the ceremony being performed by a Reading clergyman. The young man is tall and finely formed, is a German by birth and has been in the country not quite a year. He has a good education and wants to be a farmer. The lady is proud of him, and does not seem at all embarrassed when reference is made as to how she secured him. He has made a 'ten strike,' and is now on a fair way of becoming a rich man by and by."

WHO ARE CREOLES?

Before I came to New Orleans, says a correspondent, I thought that a Creole was a half breed of some race, Cuban or Spanish or French, I didn't exactly know which, and I think the Northern people have the same notion, and will be grateful if I correct them before they come down here and show their ignorance, as I did. A Creole is a native Louisianian. Any one who is born here is a Creole. Just as any one who is born in Indiana is a Hoosier, and in Ohio a Buckeye. They don't have dark, pensive eyes and romantic hair; they don't sit on verandas with their fingers against their cheek and a shapely arm, bare to the elbow, resting on the balustrade; and they don't look off into the gardens of orange trees and bananas and drooping palms, with alligators crawling over the walk. It is a base misrepresentation, this idea; but I was sorry to have my romance shattered when I found it out.

ABOUT HATING.

Hate not. It is not worth while. Your life is not long enough to make it pay to cherish ill will or hard thoughts towards any one. What if this man has cheated you or that woman played you false?—What if this friend has forsaken you in your time of need, or that one, having won your utmost confidence, your warmest love, has concluded that he prefers to consider and treat you as a stranger? Let it all pass. What difference will it make to you in a few years, when you go hence to the undiscovered country? All who illtreat you now will be more sorry for it then than you, even in your deepest disappointment and grief, can be. A few more smiles, a few more pleasures, much pain, a little longer hurrying and worrying through the world, some hasty greetings and abrupt farewells, and our play will be "played out," the injured will be led away and ere long forgotten. Is it worthy to hate each other?

Many strokes, though with a little ax,
Hew down and fell the largest timbered oak.

Sabbath Reading.

"PRIEZ POUR MOI!"*

BY A. H. F.

My dying wish, for soon I hence shall go
Beyond the ken of mortal friend or foe.
Whither, ah! whither do my footsteps bend?
I may not know, but these words backward send—
Priez pour moi!

Wand'reth my soul alone or angel led,
In realms of light, or darkest gloom my bed,
Still, this my cry in keenest bliss or woe,
From blessed blights, or saddest depths below—
Priez pour moi!

For as within God's universe so wide
No place is found for human soul to hide,
So this I know, where'er my spirit be,
I shall have need of all His love for me—
Priez pour moi!

* "Pray for me!" No formal epitaph was ever so touching as this simple inscription, common in French and Catholic cemeteries.

A HAPPY CHURCH.

While speaking lately with some gentlemen connected with a very flourishing church, of which they are members, one of them said: "And there is not a grumbler in it!" Everything seemed to suit every body—pastor, elders, deacons, communicants, Sunday school, prayer meetings, the new and handsome church building, just ready to be dedicated—were all right. Brotherly love reigned over the entire community; liberality abounded, and there was the peace of Christian contentment. Happy minister! He would appreciate his seven years of labor in that "field" which the Lord hath blessed, for he came to it from another people who were otherwise. Happy church! "without a grumbler in it!"

Grumblers have their uses, like thorns and goads and flies and mosquitoes. They may be even "means of grace" to some ministers who have grace enough to bear with them. But they are so wrapped up in their own discontent and so unhappy, whether they keep it in or let it out, that they have the gift of keeping other people all the time in the same hot water with themselves. We suppose that they must be endured, because they are, as a class, past cure; but they are a hard set to get along with in any church, and if the Lord does not have more patience with them than those whose patience they try so sorely, they will have their reward after their own ways. But happy is the pastor and happy the church which have no grumblers to trouble them. How many such are there "among the thousands of Israel?"

GOLDEN GLEANINGS.

The fool derideth another's deformity.

The violation of truth is an infamous crime.

Fear is implanted in us as a preserver from evil.

Hope, though valuable, is not always a sure antidote to misfortune.

A good conscience seats the mind on a rich throne of lasting quiet.

Virtue is the greatest ornament, and good sense the best equipage.

In your worst estate, hope; in your best estate, fear; in every estate be circumspect.

In the Christian race all patient runners win, and in the Christian battle all who endure to the end are victors.

Let the fire be always burning brightly and ardently on your own altar, wherever it may blaze or blink besides.

I know of but two beautiful things:—the starry heavens above my head and the sense of duty within my heart.—*Kant.*

He that has tasted all the bitterness of evil fears to commit it, and he that hath felt the sweetness of mercy will fear to offend it.

Every day brings its own duties and carries them along with it; and they are as waves broken on the shore, many like them coming after.

They who are most weary of life and yet are most unwilling to die are such as have lived to no purpose—who have rather breathed than lived.

It is never too late with us so long as we are still aware of our faults and bear them impatiently—so long as aspirations eager for conquest stir within us.

The whole story of human life is compressed into this dainty little poem by Jean Ingelow:

Sweet is childhood—childhood's over.
Kiss and part.
Sweet is youth; but youth's a rover—
So's my heart.
Sweet is rest: but by all showing
Toil is nigh.
We must go. Alas! the going.
Say "Good-by."

If God, our Heavenly Father, seems distant and uninviting to us, it is because, like the prodigal son, we have taken our portion of goods and gone into a far country to set up for ourselves, that we may foolishly enjoy, rather than reverently serve.

How often do we try, and persevere in trying, to make a good show of outer good qualities, without anything within to correspond, just as children will plant blossoms without any roots in the ground, to make a pretty show for the hour! We find fault in our lives and we cut off the weed, but we do not root it up; we find something wanting in ourselves and we supply it, not by sowing the divine seed of heavenly principles, but by copying the deed that the principle ought to produce.

Ladies' Portfolio.

ETHEL.

THE harvest was ripe on the hill,
The harvest-moon reigned in the sky,
And her mantle of gold floated down o'er the world
And gilded the waters, by breezes uncurled,
When plighted were ETHEL and I.

We stood by the murmuring marge,
In the lull of the evening's breath;
And we said:—As these rivulets mingle their tide,
Our spirits united, as one shall abide
Till we enter the ocean of Death.

We plucked the fair flowers of hope
To garland our life-shallop o'er;
And wove us bright fabrics of faith for our sails,
And with Love for our pilot we feared not the gales
That might threaten from headland and shore.

We sailed in this love-freighted bark
On the tide of the unresting river;
And morning gleams deepened their tints into splendor,
And sunset glows melted to twilight so tender
That we fain would have lingered forever.

But the current we could not delay,
And the pictures so fair to behold,
Of sky-tint and landscape with fragrantest flowers,
Like flocks of fair birds in summer-time's hours,
Flew past us on pinions of gold.

Many days far away we descried
A boat with a sail black as night;
And sometimes we deemed it a phantom, but when
It drew near and we saw the pale boatman within,
Our souls read its meaning aright.

I knew what that dark wing would bear
Away, and I strove with my might;
But she whispered,—"Farewell, Love, 'tis heavenly here,
But I see the Green Hills, and 'tis heavenlier there,"
And the boat vanished into the night.

Alone in my shallop I sail
On the tide of the unresting river;
And her tender farewell, and her love-lighted eyes,
Are borne on the breeze and gleam out of the skies,
And I long to be with her forever. F. H. G.

THE FLOWER AND PLANT MANIA.

BY ROSE GERANIUM.

YES'M, *it's me!* "Where have I been?" In a very good world, my dears, storing up the joys of the present as so many shining little bits toward the great heaven-mansion we are all hoping for in the future! And though I am not sure that things are proper in improper places, as a by-dignitary I am going to write it just here that it is my private belief we will have to put up in very much the same kind of mansion we are able to fashion from these lilliputian pebbles. Now that I should say it, who certainly shouldn't, after all my past faith and works, I trust the lenient sisterhood will not make my burden of penance greater than I can bear. And if any one is offended, I wish it to be distinctly understood that I *don't refer to her*—not by any means! But she, if she looks across the street into her neighbor's affairs (though she *won't*, we all know!) may possibly understand who it is that has become the basis of my remarks.

Now that our eye is upon her let us scrutinize her doings. She is most certainly an ambitious candidate for air and exercise, for she has made just thirty-one trips from her sitting-room to the sunny south steps, bearing burdens which vary from five to forty pounds each. "Her blessed flowers, and she couldn't part with them for a world. They are so comforting, companionable and soothing. They make her pure,—and better"—. O, in mercy hush! We are fickle as a woman in our wavering toward solid reformations and we are particularly tender on this subject; so let us alone until we get the disagreeable duty off our rebellious hands. If we recollect how things looked in one of our wide-awake clairvoyant trips, we are very skeptical in regard to her husband's faith in their calming qualities. In truth we believe he candidly set SOPHIA down as a deplorably nervous and cross woman, though the next instant he told himself it was only a brute who would get out of patience with the pale, trembling, back-ache-and-head-ache-y mother of his children. If SOPHIA felt his coldness let us hope that some potent influence flowing from those thirty-one beautiful specimens of smiling nature may charm away her heart aches, as she clasps frail arms around them and tugs them in from the cooling air this evening.

"Did we ever put our vaguely-expressed faith into practice?" Aye! we have! Did we not whitewash our visage with a hellevlug smile while frost did his best night's works among our plunged and our bedded-out things? Did we not look to our flax and our wool, and let the tender perennials look to themselves? Did we not ignore the creepers, the trailers, the climbers, the jews that wander and the jews that don't wander, and build ourselves up on the awful wall that gives a broader vision?

We awoke, and lo! a thousand (strictly metaphoric) delegates from foreign land had got the doors opened and fastened their footholds—or rootholds—within. The tables, stands, brackets and mantels were conceded possessions. They nailed down the sewing machine lid and kept the piano lid open. Our soul fainted within us—but our ruffles needed to be ironed. We had forsworn ourself against lifting a single pot the whole winter through (except some ten or twelve that we had just culled from the creamiest cream of flowerdom),—but we wanted the laundry table. We practiced meekness for three hours and then blandly unbosomed our desires.

"Most certainly you can have it," was the answer. "Just set the plants in the sunshine of the dining-room windows. It will do them good!"

Think upon it, ye who vow vows! Yet we took up our cross and never a murmur escaped these patient lips!

"There is a tide in the affairs of men——"

and women too, when they won't endure another atom for anybody. We reached that climax when our beautiful new footstool and slipper box was requested as a casket for the *extra nice* tuberose bulbs. Then it was that we rose up like a—like a spunky woman! and spoke the thing that we meant! "I'm not going to permit it! I've taken too much pains with the outside of that box to think of turning it into a dry-cellar. The tuberoses may go to the—green-house, if they want to! There!" But they didn't seem to desire the voyage, and I have concluded that speaking the thing one means is only a figure of speech, after all; for the bulbs are all wrapped for packing and to-morrow my slippers move? Can any one tell where they are to go?

FOR AND ABOUT WOMEN.

ANNE BREWSTER is writing letters from Rome to the Philadelphia Bulletin.

QUEEN VICTORIA has decided to send twenty pictures of the Royal collection to the American Centennial.

MISSES EVELINE and Althea Taylor of Westport, have lost by fire their ancient family mansion, built in 1700.

MRS. JULIA WARD HOWE lectured in Reading, Mass., recently. Her subject was "The Legacy of the Good Shepherd."

JULIA A. GOULD of New York, has recovered $6,000 damages for a fall on the ice in City Hall Avenue, in January, 1873.

MRS. N. E. RUSSELL of Greenfield, Mass., is President of a new society auxiliary to the Woman's Board of Missions.

STATISTICS are given to prove that of the sum total of human misery, physical and mental, women have to bear two-thirds.

STORE girls all over the country are taking a firm stand on the sit-down question. They have the sympathy of the general public.

MRS. MARY HOWITT, the well-known advocate of Abolition and Woman Suffrage, now appears as a correspondent of the N. Y. Observer.

MISS P. E. TOWNLEY has recently been preaching in Wallingford, Conn., and a Moody and Sankey revival, on a small scale, has crowned her efforts.

MRS. STEARNS, the widow of the late Dr. Samuel Stearns, eighty-two years old, has just returned from Kansas, making the 2,000 miles journey alone.

MISS I. C. DE VELLING of Springfield, Mass., has gone to New Haven, to take part in the temperance work by request, and will afterward go to Portland, Ct.

MISS ANNA E. DICKINSON is said to be in such an unsatisfactory state of health that her physician has ordered her to abandon all work and take a sea voyage.

JOSEPHINE J. THOMAS of Cornell University, is among the contestants for the Greek prize in the annual inter-collegiate literary contests just begun in this city. May she win!

MINNIE WHITE of North Middleboro, Mass., a girl only seven years old, a few days ago plunged into a pond and pulled out Lelia Lincoln, ten years old, who had broken through the ice.

A BEAUTIFUL and aristocratic Louisville girl of seventeen smokes a short, black clay pipe filled with the strongest plug tobacco. She was born with a love of the weed, and the habit has steadily grown upon her.

THE Princess Natalie De Keschko, recently married to Prince Milan of Servia, is described as looking like a Greek statue stepped down from its pedestal, and as having the air of a goddess when goddesses were believed in.

THE Marquise De Chambrun, the granddaughter of Lafayette, now a resident of Washington, has in her possession a set of pearls given her grandmother by Marie Antoinette, at whose wedding that lady acted as bridesmaid.

IN Newark the other day a fashionable mother said to the family physician in the presence of her three giggling, frivolous daughters: "Doctor, how can we improve our girls?" "By improving the mothers," was the gruff reply.

MRS. RAMASWAMI, a native Hindoo Christian lady, the wife of a clergyman at Indore, has been appointed by Maharajah Holkar, on a salary of one hundred rupees (about fifty dollars), as tutoress to the zenana of Bala Sanib, the young prince.

A WESTERN lady gives the following advice to girls engaged in looking up husbands:—"Look out for physical health and beauty for the sake of the race. Do not bestow a glance on the lean, dyspeptic, cadaverous biped; shun him as you would a pestilence."

THERE seems to be much suffering this winter among the genteel, poverty-stricken women in Washington. A few days ago two ladies, descendants of three of the most distinguished men whose names are interwoven with the history of this country, were turned out of their home in that city for non-payment of rent.

MARY MUKPOCH MASON divides her sex into three classes—the giddy butterflies, the busy bees and the woman's righters. The first are pretty and silly, the second plain and useful, the third mannish and odious. The first wear long, trailing dresses and smile at you while waltzing; the second wear aprons and give you apple-dumplings; and the third want your manly prerogatives, your dress coat, your money and your vote.

Reading for the Young.

THE OLD PROVERB.

"THE boy is father of the man."
Such talk sounds very queer to me,
But I suppose they mean to say
If I a true brave man would be,
I must not be a sneaking boy,
But in my work or in my play,
Whatever I may say or do,
Be true and honest as the day.

"The boy is father of the man."
I wonder how it is with girls?
If all they care for is to be
Pretty and fair, with glossy curls,
And handsome dresses will they grow
To noble women, good and true?
Or will they be like pretty dolls
Which please us for an hour or two?

"The boy is father of the man."
Then boys and girls, suppose we look
For the best pattern we can find,
And take him for our copy book.
Then looking backward, we may see
A pleasant pathway clear and bright,
And looking forward we may hope
To reach the world of light.

LETTERS FROM BOYS AND GIRLS.

From a Virginia Girl.

DEAR RURAL:—In one of the numbers for this month I read a letter from your correspondent at Rocky Mount, Va., and thought I would reply, as some of the other Cousins have done so. I would most gladly receive and acknowledge the title of relationship, which "Young Tom" so disdainfully rejected, should it be tendered me; and I would also say, for the benefit of said correspondent, that the "fair cousins" are not *extremely* anxious to have him acknowledge the tie; it was merely a courtesy extended. The compliment he paid us, in speaking of our society, is returned in all sincerity. The flippant talk, which gentlemen think so interesting, is most tiresome, and we must endure it, and even engage in it, if their company would be tolerated at all. I guess no more intrusions will be made upon YOUNG TOM, and I hope he will not, hereafter, give publicity to his opinions regarding the "fair" portion of your correspondents. His letters, generally, are interesting, and I hope he will not be silenced by this rebuff.—MINNEHAHA, *Salem, Roanoke Co., Va.*

From a Canadian Girl.

DEAR MR. EDITOR:—This is the first time I ever attempted to write to the RURAL. I am eleven years' old. My brother has taken the RURAL the last year, and we all like it very much. Pa takes several papers, but ma and I like the RURAL the best, on account of the nice stories and likewise the useful hints on gardening, and the many good recipes. I am going to school and taking music lessons. I have two pets. One of them is a beautiful red bird, a present from my cousin in Ohio; it sings sweetly. The other is a small black and tan dog, whose name is "Trent." I am very fond of these pets. We have a nice horse that I and my sister MAGGIE, who is four years younger than myself, drive. It has been very pleasant here this winter so far. There has been good sleighing for the last ten days, and we are enjoying it very much. I will now close, wishing you and all the Cousins of the RURAL a Merry Christmas and a Happy New Year.—ADDIE CRUICKSHANK, *Trenton, Ont.*

From a Western New York Girl.

MR. EDITOR:—We have taken your paper ever since I can remember, and I like it very much, especially the Letters from Boys and Girls. I am fourteen years of age. I have two brothers and sisters older than myself. I live on a farm of 137 acres, near the Lake Shore and Southern Michigan Railway, and about three miles from the pleasant village of Fredonia, the location of the State Normal and Training School, where one of my brothers and both sisters attend. It is a very nice looking building, quite an improvement, and also a great benefit to the place. There are about 400 pupils from this and other States. Fredonia is also quite noted for its natural gas. I am lame and therefore I do not go to school, but am taking music lessons, which I like very much. And now, Mr. Editor, if you please to print this perhaps I will write again.—JESSIE A. H., *Fredonia, N. Y.*

From an Eastern New York Boy.

MR. EDITOR:—I write to you in regard to that smart Western New York Boy, who dug 225 bushels of potatoes in ten hours. I am a farmer's boy, and live in a town where every farmer raises from 25 to 50 and some even 100 acres of potatoes. My father raised about 30 acres this year. I do not pretend that I can dig 225 bushels of potatoes in ten hours, but I would be pleased to dig a race with that smart boy whenever there are potatoes to dig. Did that potato digger dig ten hours on a stretch, or did he dig one or two hours a day? Did his basket hold 60 lbs.? What is the name of the potatoes? How many did you get out of a hill?—E. M. I., *Hartford, Wash. Co., N. Y.*

From a Southern (What State?) Girl.

DEAR EDITOR:—I thought as I liked your paper so much that I would write to you. This is not the first time, for I have written three times. The first time my letter was not published, but my second (the Dew Drop) was, and I want to see where this one goes. I am 12 years' old, and am staying with my brother this winter, and I am going to try mighty hard to get up a club for your paper. I have one subscriber, but I am afraid I shall not get the others; but if I can't I don't know what I will do, for I want a microscope so bad. I have three pets—a flower, a cat, (her name is "Beauty,") and a chicken, named "Lady Jane Brown." Have any of the better writers caught any little rabbits? I used to have pet rabbits, but I let them go. I have my box set. I have a funny name for a girl. Good by.—DICKIE SIMPSON.

From an Oregon Boy.

DEAR RURAL:—I have read so many letters in your good paper from boys and girls, I thought I would write one. I am going to try to get up a club for the RURAL, if you will please send specimen copies. The past has been a very prosperous year for farmers, and I think every farmer's boy ought to take just such a paper as the RURAL. I am a farmer's son ten years old—but for fear that my letter is too long, I will close.—CHAS. WARD, *Salem, Marion Co., Oregon.*

From a South Carolina Girl.

DEAR COUSINS:—Perhaps WEBSTER SMITH didn't know that I was a SMITH, but I am. My name is not GRACIE but ELLEN J. SMITH, Walhalla, Oconee Co., S. C. The above is my address, Mr. SMITH. As for my calico dress, I have made and worn all of the new off, but have another to make. What has become of YOUNG EAGLE? As for "TOM," I think he will not write any more. Thanks to the NEW YORKER and sweet MILLIE C. GIFFORD for their letters. I wish, if agreeable to them, WILD ROSE, ROMPING BESSIE and MILLIE would write to me. Good-by, dear cousins, for this is wash-day, and I have to get dinner with my sister's help.—ELLEN J. S., *Walhalla, S. C., Dec.*, 1875.

From a New Jersey Girl.

MR. EDITOR: I am a girl, twelve years of age, and I thought I would like to be one of the RURAL Cousins. May I? My grandfather takes four weekly papers, one semi-weekly, and one monthly. Of all these I like the RURAL best, though there are others that I like to read very much. I have been trying to make out Illustrated Rebus No. 10, but did not succeed. There is no singing school in this neighborhood, but I think it would be nice if there was. If this does not find its way to the waste-basket I will try again.—MINNIE, *Leonardville, New Jersey.*

From a Hudson River Girl.

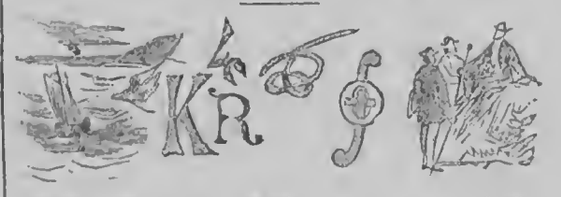
DEAR RURAL:—Having read many of the Boys' and Girls' letters, I am becoming much interested in them, and am trying for the first time to see what I, a little country girl, can do. I am attending school this winter and am studying for a prize in Lexicography. Last term I won three prizes. They were for Arithmetic, Grammar and Spelling, especially the last. Young TOM'S letters were most too simple to think of. My letter is not very long, yet still I hope it will find a welcome in your columns.—LOUIE M., *Coxsackie, N. Y.*

From a Missouri Girl.

MR. EDITOR:—As you were so kind to publish my letter I thought I would write again. I am sorry that I took ROMPING BESSIE'S name, but as I wrote first I think I am entitled to it. I should like to correspond with her, as I came from Canada. My address is HELEN M. SMITH, *Canton, Lewis Co., Mo.*—WILD ROMP.

The Puzzler.

ILLUSTRATED REBUS.—No. 2.



☞ Answer in two weeks. L. G.

CROSS-WORD ENIGMA.—No. 2.

My first is in jay but not in hawk,
My second is in crayon but not in chalk;
My third is in sale but not in trade,
My fourth is in wither but not in fade;
My fifth is in robe but not in gown,
My sixth is in city but not in town;
My seventh is in bowl but not in dish,
My eighth is in long but not in wish;
My ninth is in rise but not in fall,
My tenth is in barn but not in stall;
My eleventh is in orange but not in peach,
My twelfth is in some but not in each.

My whole gives the name of a celebrated American humorist. G. H. F.

☞ Answer in two weeks.

BIBLICAL DOUBLE ACROSTIC.—No. 1.

1. A PERSIAN king. 2. A Greek letter. 3. An Italian city. 4. A Hebrew month. 5. An idol of the Egyptians. 6. A king of Israel. The initials give a woman of Jopha, and the finals a judge of Israel. ISOLA.

☞ Answer in two weeks.

ILLUTTRATED REBUS No. 11.—Locke on the Understanding.

PUBLISHER'S SPECIAL NOTICES.

The Rural is a very good present to send to a friend, and it pleasantly reminds the recipient of the donor fifty-two times a year—this year fifth-three times. Any *subscriber* can send it to a relative or friend, as a present, at our lowest club rate—only $2.15, including postage.

Holiday Presents will be plenty this year among our Agent-Friends and others who form clubs for RURAL. Our list comprises many articles appropriate for presents. Induce a few of your friends to take the RURAL, and thus secure a Premium.

Officers of Agricultural Societies and Clubs, Granges, &c., can, if they will, materially aid in augmenting the circulation of the RURAL. Scores of such are already forming clubs; how many others will kindly do likewise?

Renew early if you would secure the uninterrupted continuance of the RURAL to your address; and pray don't forget to ask friends to join you in sending for the Fifty-three Numbers which we shall publish during 1876.

Back Numbers of this Year (from Jan. 1) can be furnished to all new subscribers, but we shall not send them hereafter unless specially requested. Those who desire can begin with any number, however.

The Best Paper, and the Best Premiums to Agents, is our motto. We ignore Chromos and all other cheap colored pictures, preferring to put our money *in the paper*, and in Premiums to Agents.

Select Your Premiums.—All persons entitled to Premiums will please designate what they prefer and notify us how and where to forward—whether by Freight or Express—if articles are not mailable.

Act as Agent!—Reader, if there is no agent for the RURAL in your locality please become one by forming a club. *It will pay.*

At Our Risk.—You can remit by Draft, P. O. Money Order or Registered Letter *at our risk.*

News of the Week.

DECREASE OF FREIGHTS.

THERE are signs that the railway combination, always made after the close of canal and lake navigation, is weakening. The explanation is that railroads are now so numerous, and their freight facilities so great, that competition is inevitable. If the roads were fewer, they might combine, but with ample rolling facilities, it costs little more to keep them employed than idle, and rather than suffer this last some road will give way. The Grand Trunk Railway has made a reduction from Chicago to Liverpool, carrying meats for 85c. per cwt. to Liverpool, while the contract price was 97½c. From Philadelphia to Chicago rates have been reduced to 27c. per cwt. on first class freights, and 14c. on fifth class. To St. Louis the reduction is to 38c. for first class freights, and 21c. for fifth class. In both cases the reduction is about fifty per cent. It is probable that the era of permanently high freights East and West has forever passed, and the producers of the country will not be sorry for the fact. At all which we rejoice.

HOME NEWS PARAGRAPHS.

THE following members of the Spanish Commission to the Centennial Exhibition have arrived from Liverpool in the Steamship China, Fabra, Chief of Commission; Alvaro DeLagandara, Director of the Department of Industry; Count Del Donadio, Director of the Department of Fine Arts; Joaquin Oliver, General Secretary, and Alfredo Escobar, Official Secretary, to the Commission.

The President has signed the bill further extending the time of the duration of the court of commissioners of Alabama claims to the 22d of July next.

Papers were served last week in the suit brought by the people to recover $190,312.41 from the old Brooklyn Water Board and Abner C. Keeney, contractor.

The Lodingstone block in East St. Louis, and several adjacent frame buildings were burned Dec. 29. Loss $35,000; insurance $12,000.

The residence of David Morrison at Green City, Penn., caught fire on the night of Dec. 28th, from gas conveyed from a well near by, and his wife and child were burned to death.

E. G. Southwick & Co.'s dry goods store at Springfield, Mass., caught fire from the furnace Dec. 29th, and was burned. Loss on building, $15,000; insurance, $10,000; loss on stock, $40,000; insurance, $15,000.

The Eliot Academy, in Eliot, Me., was destroyed by fire on the night of Dec. 28.

State Auditor Thayer made his defense before the Canal Fund Board, which, however, recommended his suspension, and Gov. Tilden immediately suspended him.

Gov. Tilden has not yet appointed any State Auditor *ad interim*. The law is ambiguous as to the term which a temporary Auditor can be appointed.

E. L. Pierson, Republican member of the Louisiana Legislature from Nachitochez, was shot and instantly killed on Sunday week by Mr. Cosgrove, the editor of the Vindicator. The difficulty grew out of the abuse of Pierson by Cosgrove in his paper.

The oldest minister of the Methodist Church, and probably the oldest preacher in the world, the Rev. Henry Boehm, known better by the name of Father Boehm, died Tuesday afternoon at the residence of his daughter-in-law, near Richmond, Staten Island. He was born June 8, 1775, in Lancaster Co., Penn. His father preached in "Boehm's Chapel," after joining the Methodist Church. The edifice was built in 1731, and is still standing and used. It was six years after the building of this chapel that Henry, then 22 years of age, joined the Methodist Church, and on Jan. 6, 1800, three years later, he was licensed to preach.

A barn in Pittsfield, N. H., owned by D. Perkins, was destroyed by fire on the morning of Dec. 29, together with the contents, consisting of 120 tons of hay, eight oxen, eight cows, three horses, a number of hogs and a large quantity of farming implements. The loss is nearly $10,000, with small insurance.

A severe storm of wind, rain and lightning visited the country north and northeast of Cincinnati, O., Dec. 26. Near Rushville, Ind., a freight train was thrown into a ditch by an overturned tree on the track. At Hamilton, O., the Miami River swelled rapidly, flooding cellars on the west side of the river. At Carthage, O., the Hamilton Infirmary was partially unroofed.

A hurricane which prevailed on Dec. 26 at Little Rock, Ark., blew down the walls of the Gazette ruins, killing Robert Leech, a laborer.

Early on the morning of Dec. 24 the steamboat Mary Miller, from New Orleans for Cincinnati, when about 40 miles below Napoleon, in trying to land was struck by a squall and driven against the bank, breaking her stem and causing her to ship about three feet of water. Some bales of rags were thrown overboard, the pumps set to work, tarpaulins slipped under her bow, and the boat was saved, with only a couple of hogsheads of sugar and a few barrels of rice in her hold damaged. The steamboat Illinois passing she was hailed and took off the deck load. On the arrival of the Mary Miller at Memphis, Tenn., she was attached on a claim for $30,000 for salvage, made by the officers of the Illinois; but the attachment was withdrawn on Dec. 27, and the matter will doubtless be compromised. A protest was entered by the commander of the Mary Miller.

The barrel manufactory of Jaynes & Co., Cambridgeport, Mass., was entirely destroyed by fire on Dec. 29. The building was owned by the Boston City Flouring Mills Co. and valued at $7,500; insured for $5,000. There was stored about the place 50 car loads of barrels, etc., valued at about $22,500; insured for $13,000.

A frame dwelling at Passaic, N. J., belonging to David B. Sickles of New York, was destroyed by fire on Dec. 28. The loss is $5,000, which is partially insured. The fire is supposed to have been the work of an incendiary, as the house is unoccupied.

The Baltimore dealers in terrapins keep them in nearly air-tight chests, packed layer upon layer, and deprive them of food. They grow fat under this treatment, although the fatness doubtless is the result of disease. They must each measure seven inches across the under shell before they are considered fit for the table, and are then sold at $24 a dozen.

It is not very likely this country will go short on wine soon. In California alone Amador County has 1,680,000 grape vines; El Dorado, 1,410,255; Los Angeles, 4,250,000; Napa, 3,108,500; Sacramento, 2,132,975; San Joaquin, 1,000,000; Santa Clara, 1,213,085; Sonoma, 3,603,385, and Tuolomne, 1,400,000.

FOREIGN NOTES.

ACCORDING to Hong Kong papers, placards censuring the Chinese Government for arranging terms with Mr. Wade appeared in Peking, but were immediately removed by the authorities. An uneasy feeling prevails among the native officials regarding the recent negotiations. Telegrams received from the main land indicate that the difficulty has only been settled temporarily. Considerable dissatisfaction is felt among the American residents of Tien Tsin and Peking at the order of Admiral Reynolds, sending the United States steamer Monocacy to Shanghai for repairs, owing to the unsettled state of affairs in Yunnan.

The rainfall during the last quarter has been one of the heaviest on record in England. At Oxford it exceeded the heaviest, that of 1872. The result has been serious flooding in all low-lying districts. Where the drainage was good, as in most large towns, the public health has not been affected, but in poor districts, where the water has remained in the basements of houses for days and weeks, much sickness has been experienced, and the Registrar-General's returns at the close of this quarter are looked forward to with the greatest anxiety.

A Herald dispatch from Vienna says that Secretary Fish has transmitted to all the European Governments a circular asking the expression of the views of each regarding the question of American intervention in Cuba. The object of Mr. Fish is to obtain data to be used in the preparation of President Grant's supplementary message to Congress. It is said that all the foreign Governments have replied satisfactorily; that England is ready to sustain the intervention at the present moment, and that the other nations express their willingness to support it, but hesitate to take the initiative.

A Spanish agent is now in Paris arranging for the return of ex-Queen Isabella to Spain. King Alfonso opposes the will of his Ministers, declaring that they may resign, but that his mother must have an asylum in Spain.

King Alfonso will soon sign a decree ordering that the general elections be held on the 20th of January and convoking the Cortes for the 15th of February.

Among the many other tokens of respect paid to Mr. Carlyle on his eightieth birthday was an address from the Chelsea, England, Literary and Scientific Institution, of which he is Vice-President. A portrait of the venerable writer, bearing his autograph, has been hung up in the reading room of the Institution.

Four artists are forever at work in the Uffizi Palace at Florence copying a picture of Fra Angelico, a "tryptich," with a border of heavenly musicians. It takes eight days to make a copy, which sells for sixty to eighty francs.

M. Lavally, President of the French Society of Civil Engineers and inventor of the dredging machines for the Suez Isthmus, announces that the fifteen scientific soundings taken between Dover and Calais conclusively prove that a tunnel uniting England and France is feasible. The matter now is only one of time and money.

The eruption of Mount Vesuvius, which is again active, amounted, according to the historians, to nineteen from the first to the seventeenth century, when twenty-three were recorded. In the eighteenth century twenty-three took place, and in the present century there have already been recorded twenty-five, or one every three years.

There were 19,289 deaths in Ireland during the first three quarters of 1875, in a population of 5,300,000, the greatest mortality prevailing in Ulster. Emigration has greatly decreased, 5,000 emigrants less having been reported than in the corresponding period of last year. A considerable decrease in pauperism and crime is also recorded.

The British training-ship Goliath burned at Gravesend, Dec. 22, with the loss of twenty lives.

Pierre Bonaparte has published an address announcing himself as a candidate for the French Assembly in Corsica.

The fifth century of Boccaccio's death was observed by a fete at Certaldo, Tuscany, the place of his birth and death.

At the Hotel Drnot, in Paris, the other day, was sold a valuable collection of violins and violin bows. A violin of Stradivarius was sold to Mr. Hart, an Englishman, for 7,200 francs. A violincello of Stradivarius was bought by two Frenchmen for 7,000 francs. A magnificent violin of Bergonzi was secured by an Englishman, and most of the valuable instruments sold went to England. The fine bass viol of Montagnana, however, was bought by some Frenchmen.

President MacMahon has written a letter to Minister Buffet, thanking him for, and expressing his approval of the speech in the Assembly, Dec. 24th, on the press bill.

A telegram from Berlin reports that the leading American residents in that city have called a meeting for the purpose of protesting against the strictures of the German press upon American character in their comments on the Bremerhaven plot.

A special telegram from Penang appears in the second edition of the London Times of Dec. 28th, from which it appears the British now hold all the important positions in that neighborhood. The Maharajah Lela has fled and taken refuge in Siamese territory. The British power is supreme at Perak, only the murderers of Mr. Birch, the Resident, being in arms.

The Chamber of Commerce, at a meeting in London, passed resolutions recommending the adoption by the Government of a policy of incidental protection as the most beneficial for the country under the present circumstances. A renewal of reciprocal trade relations with the United States was likewise recommended.

A memorial, signed by 129 clergymen and sixteen magistrates of the County of Derby, England, has been forwarded to the Home Secretary, praying that in any bill which the Government may introduce relating to the observance of Sunday, no permission may be given for the opening of aquaria or other places of amusement or of secular instruction on that day for money payment.

Lord Penzance designated Jan. 4th as the day for hearing the charges against the Rev. C. J. Risdale, incumbent of St. Peter's, Folkestone. This will be the first case under the new Public Worship Regulating act. Mr. Risdale is charged with using lighted candles on the communion table, mixing water with the sacramental wine, using water bread, adopting the eastward position, wearing illegal vestments and indulging in illegal processions.

As a measure of the extent to which the adulteration of butter is carried on in England, it is stated that from one manufactory alone 4,000 pounds of doctored stuff are ascertained to issue daily. A curious method of sophisticating oysters is also practiced in England. There is a French variety of the oyster in great repute—the Marennes, dredged in the vicinity of La Rochelle, and the flesh of which is of a deep green, said to be produced from feeding on the infusoria of the estuary where the oysters are stored. An imitation article is alleged to be produced in Falmouth by watering ordinary oysters with solutions of copper.

An Order in Council has been passed reducing the expenses of the Dominion Emigration Agency in London, England. A number of the officials are to be dismissed and other reforms instituted.

A new industry has started into being at the Halles Centrales, Paris. Large wagons, loaded with fresh vine leaves, arrive early every morning. A crowd of old women, dressed as peasants, surround them, purchase the leaves, wrap them tastefully about lumps of tallow, adroitly colored, and then go from door to door and sell the stuff as fresh butter.

A company of Spanish military engineers will be seen in full uniform at the Philadelphia Exhibition. They will superintend the embarkation of all packages from Spain, accompany them across the Atlantic, and will prepare the necessary fittings and decorations in the Spanish department of the Exhibition building.

Austria's project for the pacification of the Turkish provinces now in revolt, recently drawn up by Count Andrassy, the Prime Minister, has not yet been sent to the great powers, for some reason unknown.

Sydney Harbor, Cape Breton, was frozen over Dec. 29.

The work on the Greenville Canal, Canada, is being pushed forward. Nearly 500 men are now employed on the works and more are being engaged.

The Canadian Government has been informed that teams from Manitoba will be permitted to cross the boundary line at Pembina to bring in seed wheat and other grains for the sufferers by the grasshopper devastations.

At a meeting of the Chamber of Commerce recently, a discussion was held relative to the system of foreign nations granting bounties on drawbacks on manufactured articles exported to the Dominion, and a resolution was passed urging upon the Government the advisability of passing an act giving the Governor-General in council the power to add additional duty to such articles equal to the bounty or drawback. The depression of the Nova Scotia coal trade was discussed by some members who wanted a duty of 50 cents per ton placed on coal, but the idea that Western provinces would look for duty on flour if coal was taxed prevailed, and a resolution was passed that the ruinous state of the coal trade in Nova Scotia demands serious attention from the Dominion Legislature.

THE SEASON, CROPS, PRICES, ETC.

Watson, Allegan Co., Mich., Dec. 26.—The past was a very cold season here, yet all crops did well, except corn. On the night of Sept. 17th a severe frost prevailed, entirely stopping the growth of corn, which required two weeks of warm weather to complete its growth and ripen it. Hence we have a large quanility of soft corn on hand that we are trying to feed out before the extreme cold weather of winter freezes it solid. Apples in this vicinity were a light crop compared with former years, although considerable shipping was done from this point. Prices rule about as follows: Beans, $1; Butter, 20 to 25c.; Beef, (dressed) 4½ to 5c.—live per 100 lbs, $3; cheese, 13 to 15c.; chickens, (dressed) per lb, 6 to 8c.; eggs, 18 to 20c.; lard, 13 to 16c.; potatoes, 25c.; pork (dressed) 7 to 8c.—live, $6 to $6.50; honey, strained, 12 to 13c. per lb.—in comb, 15 to 16c.; onions, 40 to 60c.; turkeys, (dressed) 8 to 10c. per lb.; dried apples, 6 to 8c.; green apples, 65 to 75c. per bush.; smoked meat, beef, 10c.—hams and shoulders, 9 to 12½c.; beeswax, 18 to 22c. per lb.; tallow, 8 to 9c.; hay, $8 to $10 per ton; grain—wheat, $1.10 to $1.20 per bush.; corn, new, 40c.—old, 60 to 65c.; oats, 30 to 35c.; flour, 100 lbs., $2.50 to $3.50; corn meal, 100 lbs., $1.50 to $2; buckwheat, 35 to 45c. per bush.; bran, 100 lbs., 75 to 80c.; corn and oats, ground, $1.50. Ready sale for all the above produce at the figures mentioned. Wages have ranged from $12 to $20 per month and board on farms in this vicinity, and plenty of help to be had at these figures. We have had several dashes of snow up to this date, and on the 20th sleighs were the medium of transportation, but before night the ground was bare; the sun and a warm breeze which prevailed caused the snow to vanish sooner than it came. Last Friday afternoon it rained hard, and to-day it is raining again, although during last night there was enough chill in the atmosphere to cause snow, which fell during the night to a depth of an inch. Sheep have picked almost their entire living thus far, and have done well.—H. P. E.

Perry City, Wood Co., Ohio, Dec., 1875.—We have had a mild winter so far, with but little snow. Late pasture was very good. Stock has done well, and is in good condition to go into hard weather. Milch cows and fat cattle are selling at fair prices; other cattle are rather dull. Sheep are in good condition—farmers have killed or sold about all of their fat hogs; the short corn crop made it desirable to kill and sell early. Fat hogs sold at $5.10@5.30 per 100, gross. A few hogs in Wood Co. died of hog cholera. Times are a little dull, yet farmers have but little to complain of, as their business does not suffer so much from dull times as that of merchants and manufacturers. Our corn crop was rather light; wheat was quite good; potatoes never so good before. There is an abundance of feed, unless we should have an extraordinary hard winter, a large amount of hay having been left over from last winter. Winter wheat looks well. Wheat is worth $1; corn, 50c.; oats, 30c.; butter, 25c.; eggs, 22c.; lard, 10c.; potatoes, 30 to 35c.—H. W.

Amherst, Mass., Dec. 29.—Our winter set in Nov. 28th, with the mercury in the neighborhood of zero for several days; then it was mild for a week or two, but on the morning of Dec. 20th the mercury sank to 13 deg. below zero, and on the morning of the 21st had risen to 42 deg. above—a change of 55 deg. within twenty-four hours. Since then it has been very mild for the season, with some thunder and lightning in the evening of the 26th. No sleighing yet.—L. W. G.

Ridgewood, Bergen Co., N. J., Dec. 30.—For nearly two weeks we have had weather which reminds one more of spring than the beginning of winter. Rain and sunshine alternately, with wind shifting to all points of the compass without giving us a freezing blast. Roads bad, mud deep enough for a spring break-up, and, with all, a bad prospect for making calls on New Year's Day in the country.—A. S. F.

Ovilla, Ellis Co., Texas, Dec. 18.—We have had a very open winter. The thermometer has not been lower than 30 deg. Wheat crop very promising; also the acreage is very extensive. Corn is worth 45c.; wheat, 95c. to $1.10; oats, 50c.—J. M. L.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Friday, Dec. 30, 1875.

As we remarked in our last, the holidays are of but little value as a test for the situation of commercial matters. The absence of good bright weather has made even lines of property that have to go into use duller than they ought to be. The prevalent impression in all circles is that moderate prices will be the rule during the rest of the winter. Some holders of special qualities of produce express a determination to force buyers to their views. This may be said of a few fancy marks of cheese, "gilt-edged butter," or choice smooth, well-kept apples. If present extremes for exclusive articles should be fully supported, we think the limit of success will have been realized, as we have little faith in any advance with the present outlook.

BEANS AND PEAS.—In beans the tone of the market for both mediums and marrows is in buyers' favor. There has been a pretty liberal export demand for the latter, amounting to about 1,500 bbls. during the past two weeks, but the stock is still heavy. Mediums are not expected to move until after the first. Pea beans still show the old drawback of poor, unattractive quality. Kidneys are not moving. Limas do not seem wanted in a wholesale way. Green peas have merely a jobbing call. B. E. peas are a trifle higher. Canadian peas quiet and lower.

We quote Beans, pea, new, prime, $1.75@1.80; other, 1.50@1.65; medium, new, $1.45@1.50; fair to good, $1.20@1.35; very poor, 95c.@$1; marrow, new, prime, $1.75@1.85; other, $1.55@1.65; white kidney, prime, $2.20@2.25; fair to good, $1.80@$2; red kidney, new, prime, $1.65@1.75; fair to good, $1.40@1.50; California Lima, choice, $5.50@6.50. Peas, Canadian, bbls., new, duty paid, $1.25@1.27; bulk, in bond, $1.03; green, new, ₱ bush., $1.75; Southern B. E., ₱ 2 bush. bag, $3.10@3.15.

BEESWAX.—Small lots on export account have been sold at 31½@32c. for Western, and 32½@33c. for Southern.

BROOM CORN.—Prime stock is scarce and wanted; poor grades plenty and selling low.

We quote Brush, short green, 9½@10c.; hurl, green, 10c.; green, medium, 7@8c.; red and red tipped, 6@7c.

BUTTER.—Receipts are moderate and the market is unchanged. In fact, general trade is not active enough to create much competition for any sort. We seldom hear of State dairies above 30c., and then they must be about perfect. Very desirable stock is still offered freely at the range pitched upon last week, 25@28c. Choice selected ends of dairies or a fancy small line will bring 29c. from stores. The market trade is using Welsh at quotations and such fresh Western as can be had. Receipts of the latter are light, but it is thought we will have a better offering of it soon as other cities seem inclined to divide up their supplies with us. Rolls have accumulated somewhat and prices are weaker.

State dairies entire, extra, 30@—c.; entire, good to prime, 26@28c.; fair to good, 24@26c.; firkins, selected fresh, 28@30c.; good to prime, 25@28c.; fair to good, 21@25c.; half-firkin tubs, selected, 35@35c.; good to prime, 30@32c.; fair to good, 27@30c.; poor to fair, 25@27c.; State, Welsh, tubs, fall made, 30@31c.; dairies, 27@29c.; good to prime, 25@27c.; fair to good, 24@25c.; poor to fair, 22@23c.; Pennsylvania, store packed, 17@26c.; Western, dairy tubs, selected, 26@27c.; good to prime, 24@26c.; tubs selected fresh, 26@27c.; good to prime, fresh, 24@25c.; fair to good, fresh, 21@22c.; poor to fair, fresh, 20@21c.; Western, early packed, selected, 21@22c.; Western, early packed, other, 16@20c. Roll butter, good to prime, 24@25c.; fair to good, 22@24c.

CHEESE.—Export trade is somewhat larger, chiefly in good stock, at 11¼@12c., and prices at 12¾@13¼c.; fancy held at 13@13¼c. With the turn of the year, the trade anticipates increased movement and meanwhile are not pressing business.

New State factory, fancy, 13@13¼c.; fine, 12¾c.; do. good to prime, 12@12½c.; fair to good, 10@12c.; poor to fair, 7½@10c. State Farm Dairy—fancy, 12¾@13¼c.; good to prime, 11¾@12c.; fair to good, 10@10¾c. Western factory, cheddar, fine, 12@12¾c.; good to prime, 11@12c.; flat fine, 12¾@13c.; good to prime, 11@12c.; fair, 8@11c.; poor to fair, 6@8c.; English dairy, Connecticut, 12@13½c.; do. State, 17@20c.; pineapple, 16@18c.

CIDER.—Small prime packages are selling well for New Years. Quoted at 23@25c.; large packages or casks, 15@20c.

COTTON.—The foreign markets are dull and have tended to easier figures closing as follows:

December, 13 1-16@13¼c.; January, 13 5-32@13¼c.; February, 13 5-16@13 11-32c.; March, 13 9-16@13 19-32c.; April, 13 13-16c@13 27-32c.; May, 14 1-32@14 1-16c.; June, 14¼@14 9-32c.; July, 14 13-32@14 15-32c.; August, 14¾@14 9-16c.

Quotations for spot cotton, based on American standard of classification:

	Uplands.	*Ala.*	*Orleans.*	*Texas*
Ordinary	10¾	10¾	10¾	10¾
Strict ordinary	11	11	11	11
Good ordinary	11⅛	11⅛	11⅛	11⅛
Strict good do.	12⅛	12⅛	12⅛	12⅛
Low middling	12 11-16	12 13-16	13 15-16	13 15-16

Fair	15⅜	15½	15⅝	15⅝

Stained.

Good ordinary	10¾	Low middling	13⅜
Strict ordinary	11¼	Middling	12¾

DRIED FRUITS.—Business is very slow in all descriptions, with prices unsettled, and favoring the buyer.

Apples—State, sliced, 10@10½c.; quarters, 9¼@9½c.; Western quarters, 8¾@9c.; Southern sliced, 1875 crop, 9¼@10c. for prime, and fancy 12c.; Tennessee quarters, 8½c. Blackberries, new, 10@11c. Peeled peaches, good and prime Georgia, 11@13c.; do. fancy, 19@20c. Unpeeled peaches, new, 12¾@13c. for halves, and 11½c. for quarters.

EGGS.—Strictly fresh Western prime limed are as firm as they were at our last. All of the later arrivals of Western fresh are not giving satisfaction in quality. Scarcely any near points appear in the receipts.

Jersey and Pennsylvania, single bbls., ₱ doz., 31@32c.; State, 30@31c.; Western, prime, 29@30c.; do. fair marks, 28½@29c.; Canadian, 29½@30c.; Southern, 29@30c.; Limed, State, prime, 25@27c.; do. Western, good to prime, 24@25c.

ESSENTIAL OILS.—Wholesale quotations as follows. Small parcels of peppermint a shade above.

We quote peppermint in glass "H. G." $4.25 ₱ lb., cans, ₱ lb., $4. Wintergreen, $3.25 ₱ lb.; sassafras, 65c.; spearmint, $3; pennyroyal, $2; wormwood, $4; tansy, $4.

FEATHERS.—Quoted stronger at 60@65c. for prime live Western geese and 35@55c. for mixed. Common poultry feathers not inquired for.

FLOUR.—Stocks are liberal, estimated at about 389,000 bbls. and steadily accumulating, tending to weak and irregular prices.

Superfine State, $4.25@4.40; extra do., $4.80@5.90; superfine Western, $4.80@4.90; extra do., $5.80@5.90; No. 2, $3.20@4.40; extra round-hoop Ohio, $4.95@5.30; trade brands do., $5.35@7.40; white wheat extras, $5.95@7.00; St. Louis, $5.35@9.00; City Mills extra, $5.10@6.75; Southern at $4.20@4.50 for superfine; $4.80@6.40 for poor to choice shipping extras; $5.50@8.75 for trade and family brands. Rye flour at $4.85@5.50.

FRESH FRUITS.—Comparing this year with last, the foreign export of apples is nearly 30,000 bbs. less. The city demand is not large, still there is some improvement, buyers paying best prices, which is favorable for common lots. The available stock of California pears is small and prices for Glout Morceau are stronger. Winter Nelis have been chiefly bought up ahead. California pears soften quicker this season than they did last. Catawba grapes are offering freely at 10c. ₱ box for average stock. A few extra marks may be quoted at 15@16c. ₱ lb. Most of the remnant is of poor flavor; in fact, Catawba did not ripen into their usual excellence this season. The demand for cranberries is again steady. Peanuts have sold well. Hickory nuts are slow. Florida oranges are in demand when in good order, boxes containing about 200, from Orange Mills, St. John's River, bring $4.50@5. This fruit is of fine color. Barrels of same are quoted at $7@10.

Apples.—Spitzenbergs and Baldwins, fine, $3.50@4; Greenings, $2@3.50; mixed, good, $2.50@2.75; do. fair, $2@2.25; Lady, $6@15. Pears—Choice Cal., ₱ box, $4@4.50. Cranberries—Jersey, choice, bush. crates, $3 good to prime, $2.62@2.87; good to choice, ₱ bbl., $8.75@9.75; Cape Cod, fancy, ₱ bbl., $9.75@10.25; Eastern, fancy, $9.75@10.25; good to prime, $8.50@9.50. Nuts—Peanuts, Virginia, $1.25@1.50; do. Wilmington, $1.35@1.75; do. Tennessee, 75c.@$1.15; Hickory nuts, $1.25@1.50.

FURS AND SKINS.—There are no new features. Prices are likely to remain nominal for a week or two. We quote:

Bear, Northern, as to size and quality	$10 00	to	15 00
Bear, Southern and Northern yearlings	5 00	to	10 00
Beaver, Northern, per skin	2 50	to	3 50
Beaver, Western and Southern	1 50	to	2 50
Badger	20	to	50
Cat, Wild, North and East States, cased	50	to	60
Cat, Wild, Southern and Western	40	to	50
Fisher, Northern and Eastern	7 00	to	12 00
Fisher, Southern and Western	3 00	to	8 00
Fox, silver	15 00	to	50 00
Fox, Cross, Northern and Eastern, according to size and color	3 00	to	5 00
Fox, Red, Northern and Eastern, according to size and color	1 50	to	1 65
Fox, Red, S. Penn., N. J., and N. Ohio	1 25	to	1 50
Fox, Red, Southern and Western	75	to	1 00

Rabbits, prime, cased	2 01	to	3 00
Skunks, prime black, No. 1, cased	—	to	1 30
Skunks, prime black, No. 1, open	—	to	1 00
Skunks, prime one-half white streak	50	to	80
Skunks, whole streaked	15	to	20
Wolf Skins, mountain, large	2 00	to	3 00
Wolf Skins, prairie, prime	75	to	1 25

HONEY.—The prolonged dullness has produced some anxiety on the part of holders, and they express themselves ready to shade even the late low rates in order to start trade. White clover, in glass, 20@25c.; buckwheat, 15@17c.

GRAIN.—Wheat is in large stock, difficult to sell and lower. Latest sale at $1.20 for 16,000 bu. ungraded Milwaukee spring afloat, $1.08@1.09 for car lots No. 3 spring, $1.30 for No. 1 Milwaukee spring afloat, $1.08 partly for No. 3 Chicago spring, 95c.@$1.15 for inferior and ungraded spring, 98c. for rejected spring, $1.30@1.37 for red Western, $1.45 for choice amber Pennsylvania, $1.19@1.25 for No. 2 spring, $1.15@1.45 for winter red and amber, $1.33@1.50 for white, and $1.30@1.32 for No. 1 spring. No. 3 Chicago spring in store at $1.07, and inferior spring at $1.02½ in store. Rye at 95c. for prime State. Barley at 85@90c. for two-rowed State, and $1.14 for fair Canada. Malt at $1.12 for two-rowed State. Corn is in active demand; sales at 21c. for prime old mixed Western afloat, 59@65½c. for damp to prime dry new mixed Western, 68c. for new white Southern, 67c. for new yellow Southern, and 68c. for yellow Western. Oats more freely dealt in and firmer; sales at 48@50c. for white State, 46@47½c. for mixed State, 46c. for prime mixed Chicago, and 47@50c. for white Western.

HAY AND STRAW—Have increased demand, with straw at lower prices.

Bale hay is quoted:—Shipping, 80c.; retail qualities, $1.05@1.15 for new; clover, 70@80c.; salt, 65@70c. Straw is quoted at $1.05@1.15 for long rye; 80@90c. for short rye; 70@80c. for oat.

HIGHWINES.—Sales at $1.15.

HOPS.—There is more doing on export account, and choice stock, which is most wanted, quoted on a strong basis.

New York State, 10@16c.; Eastern, 10@16c.; Wisconsins, 10@16c; Yearlings, 8@10c.; Olds, all growths, 4@6c.; Californians, 17@20c.

POULTRY AND GAME.—The dressed poultry market is in better shape than it has been for several days back. A good deal of stock was left over from Christmas receipts, and holders were forced to close it out very low. Fresh, small turkeys are doing better than they have before this season in a wholesale way. Geese also have an improved demand.

Turkeys, N. J., choice, 17@18c.; do. other, 15@16c.; State and Western, choice, 16@17c.; do. other, 13@14c. Chickens, N. J., 14@15c.; State, as to quality, 11@14c.; Western, 10@11c. Fowls range at 10@11c. Ducks, 13@17c. Geese, near-by, 13@15c.; do. other, 10@12c.

Live poultry is not plenty and prices for the moment are firm. Western geese showing an advance.

Chickens and fowls, State and Jersey, ₱ lb., 11@13c.; Western, 10@12c. Roosters, ₱ lb., 6@7c. Turkeys, State and Jersey, ₱ lb., 11@13c.; Western, 10@12c. Ducks, State and Jersey, ₱ pair, 75@87c.; Western, 55@65c. Geese, State and Jersey, ₱ pair, $2@2.25; Western, $1.2@1.50.

Game is very unsettled; the holidays usually excite the market for prime stock. The bulk of the back supply has sold low. Venison is very low; the weather is against its sale, and only a short season remains for it. Antelope does not seem to be a favorite.

Quail, trapped, prime, ₱ doz., $1.50@2.00; soft, $1.00@1.25. Grouse, prime, ₱ pair, 80@90c.; drawn, 45@60c. Partridges, choice, ₱ pair, 80@90c.; Western, drawn, 65c.; Eastern, 65@75c. Hares, ₱ pair, 45@50c. Rabbits, ₱ pair, 40@45c. Venison, short saddles, ₱ lb., 9@10c.; long saddles, 7@9c.; whole deer, 7@8c. Bear, black, grown, ₱ lb., 10@12c.; cub, 10@12c. Canvas-back ducks, Western, ₱ pair, $1@1.25; redhead, 70@80c.; mallard, 60@70c.; teal, 40@50c.; common, 25@40c.; Havre de Grace canvas back, $1.50@1.75. Wild geese, 75c.@$1 ₱ pair; do. turkeys, 13@15c. ₱ lb.

PROVISIONS.—The general markets are lower through larger arrivals of hogs at the West. The quotations are for mess pork $20.75, do; for January $20.40; extra prime, $16; prime mess $19.50. Dressed hogs at 8½c. for Western. Dry salted shoulders 8¾c. Bacon at 10¾c. for long clear, 11¾c. for short clear. Lard at 12¾c. for spot, December and January, 13 7-16c. for February, 13 5-16 for March. Tallow at 9¾@10c. for prime. Stearine at 13¾c. for Western. Beef hams, $21.50@22.50. Beef, extra mess, $12@12.50; do., plain mess $11@11.50; new tierced at $13 for prime mess. $25 for India mess. City extra India mess, $31.50@32.50. Old extra mess, $11.50 and $10.50 for plain mess; jacket, $15.50@16.50.

SEED.—Clover is scarce; sales at 13¾c. for State and 12¾c. for prime Western.

TOBACCO.—Exporters are taking a few lots; the general market is quiet.

KENTUCKY LEAF.	Light. Cents.		Heavy. Cents.

COUNTRY CHEESE MARKET.

LITTLE FALLS, N. Y., Jan. 1, 1876.

THERE is no material change to note in the market this week. The depression and dullness continues. The weather is cold and the country roads are in bad condition for travel. The farm dairy cheese is now confined for the most part to "odds and ends," and what little is coming forward is uneven in quality and curing, and prices range at 6@9c.

The views of factorymen holding fine cheese are above those of buyers, and there is no sale of extra fine, which some hold as high as 14c., hoping to realize that figure sometime during winter. Common to fair may be quoted at 9@10½c., with light transactions. Winter butter is coming forward and sells at 22@27c., according to quality.

We have advices from Europe up to the 17th of December. Our London correspondent says:

"The finest English Cheddar cheese is wanted, but medium is neglected. American, if fine, brings full prices, and there is a good demand for common and lower grades. Quotations are as follows:

American extra, 64@68s.; fine, 60@62s.; good, 56@58s.; secondary, 28@44s. The other descriptions of cheese sell as below:—English cheddar, 86@96s.; Wiltshire double, 72@80s.; Cheshire medium, 68@72s.; fine, 78@84s.; Scotch, 72@76s., ₱ cwt.

The market is advancing on fine qualities of butter, and some large sales have been made of American.

Clonmels, 130@148s.; Corks, 150@156s.; Dorsets, 168s.; Jersey, 140s.; Friesland, 108s.; Normandy, 110@158s.; American and Canadian, 74@120s., ₱ cwt.

Oleomargarine or artificial butter brings 60@84s. ₱ cwt.

LIVE STOCK MARKETS.

NEW YORK, Jan. 1, 1876.

RECEIPTS OF LIVE STOCK.

" Last week	7,988	119	600	25,069	25,920

BEEVES.—Trade on Monday last, owing to a light run, was fast dull than it has been for several weeks, still prices did not advance, and the markets closed with a few car loads of cattle unsold—prices were 6@13c. ₱ lb.; weights, 4½@15 cwt. Wednesday, trade very dull at 7¼@12½c. ₱ lb. When the markets closed several herds stood over unsold. Thursday, trade slow at 9@12¾c.; weights, 6@7¾ cwt. Friday, the markets closed weak at 9@12½c.; weights, 5½@8¾ cwt. From 53@63 lbs., net, have been allowed to the cwt. Spanish herds direct from the Plains, 6@8¾c. ₱ lb.; Native steers, 8@12½c.; grass do., 12¾@13¾c. Oxen, 8@13c.; mixed herds, 7@9¾c.; 431,995 beeves came to hand up to Dec. 31, 1875; sold at 6@12c. ₱ lb.

COMPARATIVE RATES.

Quality.	This week. Cents.	Last week. Cents.
Good	12 @13¾	13 @15
Fair	11 @11¾	11 @11¾
Poor	10 @10¾	10 @10¾
Poorest	6 @ 9¾	6 @ 9¾
Gen. selling rates	9¾@10¾	10 @11

MILCH COWS.—Trade so small as to render quotations valueless. 3,574 cows were received up to Dec. 31, 1875; sold from $19@125 ₱ head.

VEALS AND CALVES.—Smooth quality calves not quoted. Grass calves, quality coarse, slow of sale at $5@10.50 ₱ head. 70,193 veals and calves were received up to Dec. 31, 1875. Veals sold at 7@11c. ₱ lb.; calves at $5@22 ₱ head, also at 4@7½c. ₱ lb.

SHEEP AND LAMBS.—Trade, though small in sheep, remains firm. Lambs have not been quoted. Some 47 head of Canada lambs, weight 3,750 lbs., 7¾c. ₱ lb. Monday sheep sold at 1½@4c. ₱ lb. Wednesday, 4@5½c. Thursday, 4¾@5¾c. Friday, 5¾@6¾c. State sheep, 4½@6c. ₱ lb.; Wisconsin do., 5@5½c.; Ohio, 4@5¾c.; 1,127,941 sheep and lambs were received up to Dec. 31, 1875. Sheep sold at 5¾@8¾c. ₱ lb.; lambs, 5¾@8¾c., with spring lambs up to 22c. ₱ lb.

HOGS.—During this past week 197 Ohio hogs, live weight, 44,930 lb, sold at 7¼c. ₱ lb. City dressed have been weak and slow at 8¾@9¼c. ₱ lb. Extreme range general sales 8½@9c. ₱ lb. 2,861,943 hogs were received up to Dec. 31, 1875, so largely consigned direct to slaughterers that quotations have been unimportant.

HORSE MARKET.—Trade merely nominal. 45 head arrived ₱ Erie Railway, via, Oak Cliff Station.

PATTI paid $12,500 for a fur cloak.

CHIEF-JUSTICE WAITE is in Toledo.

SIR ALEXANDER T. GALT of Montreal, is in New York.

MARK TWAIN is recovering from a recent illness.

THE Khedive proposes a new Eastern route via the Nile.

CELIA LOGAN writes New York letters to the Hartford Courant.

Mrs. JOHNSON, widow of the late ex-President, is again seriously ill.

MR. THOMAS BAILEY ALDRICH thinks of coming to New York to live.

THE Pope indicates that he does not hold full ultramontane ideas.

SECRETARY BRISTOW'S son studies in Princeton, and his daughter in Paris.

DISRAELI says a Miss Rothschild is the most spirituelle lady in England.

MRS. GEN. SHERMAN will go to Texas with her son for the benefit of his health.

W. H. DUTCHER of Hartford completed on Dec. 24 a walk of 150 miles in 36 hours.

A GIRL in Kentucky, twelve years old, has recovered $500 damages in a libel suit.

Two of Mr. Tennyson's idyls, "Elaine" and "Enid," have been translated into Spanish.

OLIVE LOGAN thinks she will not lecture on "Butter," because she does not consider it pat.

IT is claimed that Mr. Morrison's ambition was to go on the Military Committee of the House.

SENATOR CAMERON and wife of Wisconsin are passing the Congressional recess in Elmira, N. Y.

MR. GLADSTONE does not want English convents inspected for the discovery of unwilling inmates.

THE will of the late Wm. Bose of The Baltimore American gives $19,000 to religious and charitable institutions.

CAPT. RICHARDS, who died not long ago at Colmar, was the captor of Louis Napoleon at Strasbourg in 1836.

THE family of the late Dr. Hackett of Rochester have presented his library to the Theological Seminary in that city.

A. C. MOORE of Buffalo, presented the General Hospital of that city with a check for $3,000 as a Christmas present.

MR. OLIVER WARNER, who has been Secretary of the Commonwealth of Massachusetts for 17 years, has retired from that office.

Miss ADELAIDE MURDOCH, a sister of James E. Murdoch, is in San Francisco, where she proposes to lecture on women's duties.

THE library of the late Dr. Hackett of Rochester, N. Y., has been presented by his family to the Theological Seminary of that city.

PRESIDENT PORTER of Yale College showed his liberality by preaching in the First Unitarian Church in Boston on Sunday week.

PROF. F. W. PUTNAM of Salem, Mass., has been appointed Civilian Assistant on the United States surveys west of the 100th meridian.

EX-SENATOR FENTON is staying in Enterprise, Fla., where he expects to spend the winter. His throat ailment is a great deal better.

CHARLES LAMB, according to a new biographer, was one of a family of more than six children, instead of three, as generally recorded.

HON. CHARLES HUBBARD, formerly a member of the Legislature and an ex-State Senator, died in Chelsea, Mass, Dec. 28, at the age of 80.

THE Rev. John Brown of St. George's Episcopal Church, Newburgh, preached his sixtieth Christmas sermon recently. Mr. Brown is 84 years old.

THE Taylorian scholarship of the University of Oxford, Eng., has been taken by Mr. L. Dyer of Chicago, a member of Balliol College of that institution.

THE Vienna Vaterland says that the Vicar-General, Dr. Kutschker, has been recommended by the Austrian Ministry as successor to Cardinal Rauscher.

EX-PRESIDENT THIERS has reserved the right, in the event of his election to either the Senate or Chamber of Deputies, of choosing in which branch he shall serve.

FRANCIS D. MOULTON has sued Mr. Beecher for $50,000 for malicious prosecution. Mrs. Moulton is reluctant to meet the Plymouth Committee in a mutual council.

THE Trustees of Princeton College have conferred the degree of LL. D. on Gov. Bedle of New Jersey, and that of D. D. on Prof. Briggs of the N. Y. Union Theological Seminary.

MR. GLADSTONE is busily engaged on his new book on Homer, which will be an expansion of what he has already written for The Contemporary Review on the same subject.

GEN. M'CLELLAN, rumor says, will shortly be appointed to a position in the service of the Baltimore and Ohio Railroad Company, with the title of General Superintendent or Manager.

GEORGIA papers, among them the Augusta Sentinel, insist that Tweed was in Savannah and sailed in the City of Dallas for Nassau. Two New York detectives have been investigating the case in Savannah.

DR. H. C. KING, Physician-in-Chief at the Seamen's Retreat on Staten Island, is writing a medical history of the institution, which has been in existence 43 years. This work will embody the record of an experience derived from the treatment of 67,000 cases.

WILLARD'S PRACTICAL
Butter Book
ONLY COSTS $1,
And should be in the hands of every Farmer's wife in this country. It is full of practical and scientific information upon every branch of butter making, from the care of cows to butter in the market, and should be kept for constant reference in every house where that article is made.
☞ *This book is fully and handsomely Illustrated.*
Every one can understand it, and improve the quality and quantity of their butter by reference to its pages. Written by one who has not only made a life study of the subject, but who is himself a
Practical Dairyman,
it cannot but be thorough and useful. No book contains more solid information upon the subject in so few words. A complete index enables the reader to refer to any branch of butter making, and take in the whole subject in a very short time.
Lay it beside your churn, and apply its useful lessons each day, and your one dollar book will have yielded you fifty dollars before the end of the year.
Sent, post-paid, upon receipt of $1.
Address
RURAL PUBLISHING CO.,
78 Duane Street, New York.

IN making up lists of newspapers for 1875, we hope our farmer-friends will not overlook that "old standby," THE RURAL NEW-YORKER, founded and still conducted by D. D. T. MOORE, New York. No better journal of its class is published anywhere. Join the Club now being made up at the Post-Office at only $2.15 a year.—*Lyons Republican.*

NEWS CONDENSER.

— The Greeks are shy of Russia.

— Nevada has a population of 50,510.

— Deep snow prevails throughout Europe.

— London is wrapped in a shroud of snow.

— The Suez Canal pays seventy-five per cent.

— Californians had Strawberries for Christmas.

— Bermuda's fort defenees are to be improved.

— Superstition is spreading among the freedmen.

— The South Boston Y. M. C. A., has lady members.

— The Monroe County penitentiary has 250 inmates.

— Trade Unionism has reached New South Wales.

— Six Boston newspaper men have died during the year 1875.

— Fifty thousand Hebrews carry on business in the United States.

— The latest advices from Hayti state that everything was quiet.

— "Manuscript" is suggested as a proper term for "cable dispatch."

— The English regiment at Jamaica is to be instructed in field operations.

— England proposes laws for purifying rivers. Manufacturers oppose them.

— Fifty million dollars in American property are annually destroyed by moths.

— The Y. M. C. A. of Rochester holds Sunday meetings in the Variety Theater.

— Large reinforcements have been sent to Hernani, which is besieged by the Carlists.

— The royal palace at Barcelo, Spain, was almost entirely destroyed by fire Dec. 26.

— It is said that $1,000,000 of Boston capital has been invested in Indianapolis the past year.

— The graduates of the State Normal School, Albany, had a re-union in that city, Dec. 29.

— Schenectady, N. Y., is talking about improving her sewerage at an expense of about $150,000.

— The steam ferry-boat which plies between Tarrytown and Nyack has gone into winter quarters.

— If Alaska is annexed to Washington Territory the latter will have an area of 640,000 square miles.

— The trustees of the Avondale relief fund report that from all sources they received $174,-222.05.

— A statue of Metellus, the Roman conqueror of Crete, has been found during excavations on that island.

— The English Admiralty authorities have issued a new circular on the subject of fugitive slaves.

— The Commercial Bank of San Francisco suspended Dec. 24. Liabilities about $50,000; fully secured.

— The Works of the Elmira Stamping Company, Elmira, were burned last week. Loss, $2,000; insured.

— An ice gorge has carried away a number of buildings at Pulaski, N. Y., and a portion of the town is flooded.

— The first steamer entirely laden with Nova Scotia coal which ever entered Boston Harbor arrived there, Dec. 23.

— A new pocket compass invented in England has the novelty of pointing to the true and not to the magnetic north.

— An appropriation of $25,000 is asked to convert the State Capitol Grounds at Sacramento into a State Botanical Garden.

— A Philadelphia firm has paid $50,000 for the right to sell all the beer that is to be guzzled on the Centennial grounds.

— Ship-building in Maine in 1875 aggregated a tonnage of 75,060.45, against 122,548.74 in 1874, a decrease of over one-third.

— The $4,000 claim of the Jersey City Water Pipe Company against the Village of Plattsburg has been settled for $1,000.

— A member of the California Legislature has given notice of a bill to establish a whipping-post for the punishment of wife-beaters.

— The yield of salt in Michigan this year was 1,026,978 barrels, being 200,000 barrels greater than that of the most successful previous years.

— The steamer Amerique of the General Transatlantic Company, which was recently disabled, left Roche's Point, Ireland, Dec. 29, for Havre, in tow.

— A factory for the manufacture of a new explosive, said to be ten times more powerful than giant powder, is to be started at Virginia City, Nevada.

— The annual report of the City Chamberlain of Albany shows that the receipts for the past year were $2,172,818.16; and the disbursements, $2,113,247.20.

— The absurd story about the phœnix grew out of the fact that phœnixes always roosted in ash trees, and hence when they took wing they were said to "rise from their ashes."

— The official survey of the steamer City of Peking at San Francisco, is completed. The repairs were found to be satisfactory and the ship in a thoroughly efficient condition.

— By some strange combination of circumstances the manufacture of marmalade has heretofore been confined almost exclusively to Scotland, but Florida is now going into the business, and can supply the world if she chooses.

Wit and Humor.

SPARKS AND SPLINTERS.

A GOOD hotel at night is like a railroad bed—full of sleepers.

Two heads are better than one, from a hatter's point of view.

IN the journey of this world the man who goes right is not apt to get left.

SHAKSPEARE says:—"A lion among ladies is a dreadful thing." So is a mouse.

STANLEY says that African mosquitoes are as big as a Kentucky chew of tobacco.

A LOFTY position—the top of an editorial staff.

THE hight of "a girl divinely tall" is said to be s'heaven feet.

EVERY place has its drawback—Even Glasgow has its "Cross."

SEEING is not believing. There are many men you can see and yet cannot believe.

Now somebody has invented a dish-washing machine. If they invent a few more such contrivances, including one to sew on buttons, women will not be worth fifteen cents a dozen.

A BUSINESS that is picking up—the rag gatherers.

THE center of gravity—the lowest button on a Quaker's vest.

WHEN poverty comes in at the door the broker flies away with the furniture.

"FOUR angels turned out by the hangman ye terday," is a head line in the Chicago Times.

FRANK D. DART of Chicago, and Ella Darrt of East Troy, Wis., have been married. May they have their quiver full of 'em.

THE minister who divides his discourses into too many heads will find it difficult to procure attentive ears for all of them.

AN Iowa editor recently announced that a certain patron of his was "thieving as usual." The word he wrote was "thriving."

JOHN SUPPER was divorced from his wife in Detroit last week. She prefers to go without her supper.

"THIS bank is a bad place for colds," said a printing cashier; "so many drafts passing through it all the time."

SAID an old doctor to a graduating class of medical students: "Keep your patients alive, if you can—dead men pay no bills."

A LONG BRANCH baker has received news of a ten thousand dollar legacy. He'll probably knead it.

"To bee or not to bee;" as the man said when he got home and found a swarm of them settled on his door knob."

MONDAY for wealth,
Tuesday for health,
Wednesday the best day of all.
Thursday for crosses,
Friday for losses,
Saturday no luck at all.

MILK PUNCH is now recommended as a cure for diphtheria. Certain classes have always considered it good for the throat.

"KEEP cool, darling," said a Brooklyn wife to her scolding husband as she dashed a pitcher of ice-water over his head.

NEWRASTHEUIPPOMSKELESTERIZO.—This is the name of a patent medicine advertised by a large English firm. Wonder what it cures?

COLUMBUS discovered America, but when a boy he had as much difficulty in seeing an empty wood box or water-pail as any other boy.

THE schoolmaster who sat down on the "business end" of a pin that had been ingeniously fixed on his chair, rose like a Phœnix.

YOU will notice that when a boy steps on a Canada thistle, or sticks a splinter into his foot, it's invariably a few seconds before school.

WHILE Professor Proctor was lecturing in Boston, the other evening, on "Other Suns than Ours," he received a cable despatch announcing the birth of boy twins in his family.

THE look a man gives his wife when he suddenly awakes in the morning and finds her going through his vest pockets, is not a studied expression, but it is excellent in its way.

THE fact that a girl in Texas, eleven years of age, had been led to the altar by a blind organ-grinder, leads a Houston editor to ask:—"Is the New York Ledger satisfied now?"

I WANT to be an angel—As sung by the Girl of the Period:

I want to be an angel
And with the angels stand.
With my "pull-back," tight around me
And my poodle in my hand,
With my bright-hued striped stockings
And my lemon colored gloves
I'll be the gayest angel
In the celestial groves.

SPORT IN INDIA—FACING THE ENEMY.

Consumers Importing Tea Co.,
No. 8 Church Street.
P. O. Box 5,509. New York City.

This is a combination of capitalists to supply the consumers of Teas throughout the United States on the mutual principle.

We have experienced agents in all the best districts of China and Japan to select Teas especially for our trade.

We expect every consumer of Teas to render us all the assistance they can in carrying out our enterprise, as we make a specialty of SUPPLYING CONSUMERS ONLY (and allow no middlemen to make any profit on our importations), which will enable us to supply them with Teas at prices lower than have ever been known, and of those fine qualities that seldom reach the interior, being sold only to the large cities and among the very wealthy.

Hoping the consumer will take an interest in our enterprise, and send at once for a circular with full explanations of how to proceed to obtain our goods, we remain,

Most respectfully yours,
Consumers Importing Tea Co.,
No. 8 Church St.,
P. O. Box 5,509. New York City.

Entered, according to Act of Congress, in January, 1874, by the Consumers Importing Tea Co., in the Office of the Librarian of Congress, Washington, D.C.

ELGIN WATCHES.

DECLARED by Railroad Officers, Engineers, Astronomers, Explorers, Navigators, Travelers and others, to be the **Most Accurate, Durable** timekeepers in the world.

26 GRADES now in the market, including **Ladies and Gentlemen's** sizes, **Key** Winders, **Stem** Winders, **Stem** Setters, Full Plate, Three-Quarter Plate, Plain, Full Jeweled, Etc.

PRICES ranging from a few dollars for **plain** but **neat, Durable** and **Reliable** timekeepers in Silver cases, to two hundred or more dollars for a highly finished and remarkably accurate one in fine Gold cases.

AVOID all C.O.D. advertisers and apply to dealers of known respectability, as Elgin Watches are not furnished to **any party whatever** to be sold on the disreputable C. O. D. plan, which is used to palm off imitation and pinchbeck goods.

DEMAND and receive with your watch the regular warranty medal of the Company, as noted below, and see that the name and number correspond.

THE WATCH named T. M. Avery is offered at such prices as to come within the reach of all, and is unequaled in the world for the money.

GUARANTEE The Company makes no watches *at any price*, low or high, which it is not willing to FULLY WARRANT. Each watch movement of *any and every grade*, made by the Elgin National Watch Company, and bearing its trade-mark "*Elgin, Ills.*," is accompanied by the *official* WARRANTY MEDAL of the Company, with number and name corresponding to the watch.

FOR SALE by respectable jewelers in nearly every town in the United States and Canadas, and also in the principal cities throughout the world. *Call on your jeweler and ask to see them.*

To those who are making up their minds what Agricultural paper to take next year we wish to say a word. The leading Agricultural paper of this State has been, is, and will be, MOORE'S RURAL NEW-YORKER. Last year, when rumors were rife in regard to its publisher, Mr. D. D. T. MOORE, that gentleman found a strong wind to beat against; but he finally succeeded in convincing the people that one-half of what was said was not true and the other half greatly exaggerated, and so they rallied to the support of the old RURAL. Mr. MOORE lived up to his promises, and his paper for 1874 was characterized by the same spirit that has animated former volumes. We like the RURAL, and we hope to see Orleans County well represented in the subscription books of 1875.—*Orleans Republican.*

MOORE'S RURAL NEW-YORKER is an excellent Agricultural paper, and very popular. As a family visitant it is hard to beat in the attractions it holds forth for young and old. We are pleased to see that Mr. MOORE is full of his old enterprise and bent on making the paper better and better from year to year.—*Yates Co. Chronicle.*

Floricultural.

BEGONIAS.

THERE are two very distinct classes of Begonias—the one tuberous-rooted and valued chiefly for their flowers, not that the foliage is in any way inferior; the other for their foliage, though many of these are attractive for their flowers as well. Both classes possess a distinguishing, rare, eccentric beauty—whether we view their flowers or foliage—that invests them with a special adaptability to certain purposes. Of the foliage section, many bear leaves a foot in length—some of them of a metallic-olive color, spotted and doubly margined with lighter and darker shades of a silvery and coppery luster; others with a grisaille-colored disc, margined and veined with crimson; while both upper and under surfaces, as well as the petioles, are thickly covered with bright red hairs.

The tuberous-rooted Begonias have annual stems and require a rest during the winter, beginning a new growth early in spring. The leaves are fleshy, of a rich, glabrous green, often doubly toothed or incised, and the habit of the plants is generally free and branching. The flowers of this section are often of great size, as represented in our engraving, and of various colors, such as white, cream, sulphur, orange, pink, salmon, magenta.

If—out-of-doors—Begonias are more captivating in one situation than another, it is when, in a shady, secluded nook, they are interspersed with *Ferns, Echeverias, Klenias, Sedums, Agaves* and *Cacti*. Indoors, a greenhouse temperature is suitable, and the soil needs no especial preparation.

Our engraving is from one of the many beautiful catalogues sent out by the well-known London establishment of E. G. HENDERSON & SON. E. S. C.

NOTE TO RURAL FLORICULTURISTS.

WE beg to state to the readers of the RURAL that our hardy *Phlox* seed are all disposed of. To those whose hearts are not made sick by hope long deferred, we would say that we shall save next fall from the same varieties (*Downie and Lairdes*), as well as from seedlings of our own, a sufficient quantity to supply any probable demand, when we will be happy to send them to those whom we have been constrained to disappoint.

Many applicants have inquired where they could procure *Deutzia* seeds—referred to in the same article as of the easiest cultivation. Except they may still find them clinging to the bushes in their respective neighborhoods, we do not know. Last winter so cut down the *Deutzias* upon our own premises that we did not have a bloom, except upon *D. gracilis*. But our home is in a valley that catches the earliest and the latest frosts, while the interval boasts of a lower temperature than any other locality within many miles.

Several friends cautioned us that the postcript in the RURAL (offering to forward *Phlox* seeds to applicants) would prove our last, as it was our first, experiment of the kind. We received many more letters than we anticipated, it is true; but the intense attachment expressed in many of them to floricultural pursuits, well repaid us for our inconsiderable trouble, and, if we live, the experiment at seasonable periods shall be repeated again and again. These letters show that, liberal as are our seedsmen in the distribution of their catalogues, they do not reach—or if they do, are not available to—the mass of poor people, who, in their love of flowers, no sooner ascertain the merits of a particular plant and that it is of *easy cultivation*, than they seize with avidity the first means within their narrow reach of procuring it. We give two extracts from these letters as fair specimens of many of them: "I have long wished for some plants, but, as we are in debt for our farm, my husband thinks it foolish to spend money for such things—he don't care for them as I do. When we send for vegetable seeds, I get a few papers of flower seeds; but when it comes to shrubs and plants, Oh! dear—it makes me sad to think of prices. And yet I am crazy for every new catalogue. I feast my eyes on their imagined beauties, and mark the most desirable ones against the time when my ship arrives." "Though I am poor and nearly a life-long invalid, yet my little flower garden, tended by my own hands, is such a continual source of delight, that without it life would almost be a burden."

Floricultural papers that have a care for something beyond the influx of subscriptions, could, we think, with little expense and with ultimate profit to themselves, greatly assist this class of people, while performing a commendable work in promoting a more general appreciation and cultivation of flowers over the land. There are two very distinct classes of people who spend time over flowers, viz., those who like them as flowers and those who like them as ornaments. To the latter class they are to the house what diamonds are to the person—a species of elegant furniture, the more prized because of the exceeding and general admiration they attract. They are the valued exponents of wealth, or, what is worse, the affectation of wealth, the tottering pedestal of which is well concealed beneath a lavish floral display. A Cowslip is to them a Cowslip, and rather "less" than "nothing more." They must have *flowers*—gorgeous flowers—flowers bigger than anybody else's, and, when they droop and fade, the plant is in disgrace, and the "desert air" may claim what remains of its fragrance and the plant, too, until it is ready to bloom again. If they procure rare plants they are very sure to keep them—at least while they are rare; exclusiveness adds to their value. The seeds and slips are jealously guarded, and all the more so if a neighbor has long sought them in vain.

But those who rightly love flowers cannot tell—know not why they love them. It is not for their bright colors or their fragrance alone; it is not for the green leaf, or the plant's symmetry or grace. It is not that they demand daily and patient care. They love them, in a measure, as they love a little child. The flowers cannot talk, but their actions are very winning. They love them in response to a longing of their natures—a longing that knows not of greed, and that demands no more the gratification of possession than the pleasure of distribution; and so, with slips and seeds, they are ready to share their choicest plants with those who will accept them and prize them.

There are hundreds of such true lovers of flowers who read their floricultural journals with great interest, that would cultivate plants in their sitting-rooms, if they knew what species to procure and how to procure them without much cost. Now there are hundreds of individuals who would delight in saving seeds from their own collections and sending them to just such persons. But how is the one class to communicate with the other? We answer through the horticultural journals. Let those good people who have seeds to spare, communicate the fact to their favorite papers, with the names of genera species and varieties, and their address. We doubt not that any journal would publish such a notice, if it conveyed with it strong evidence of good faith. Then let those desiring such genera, etc., apply.

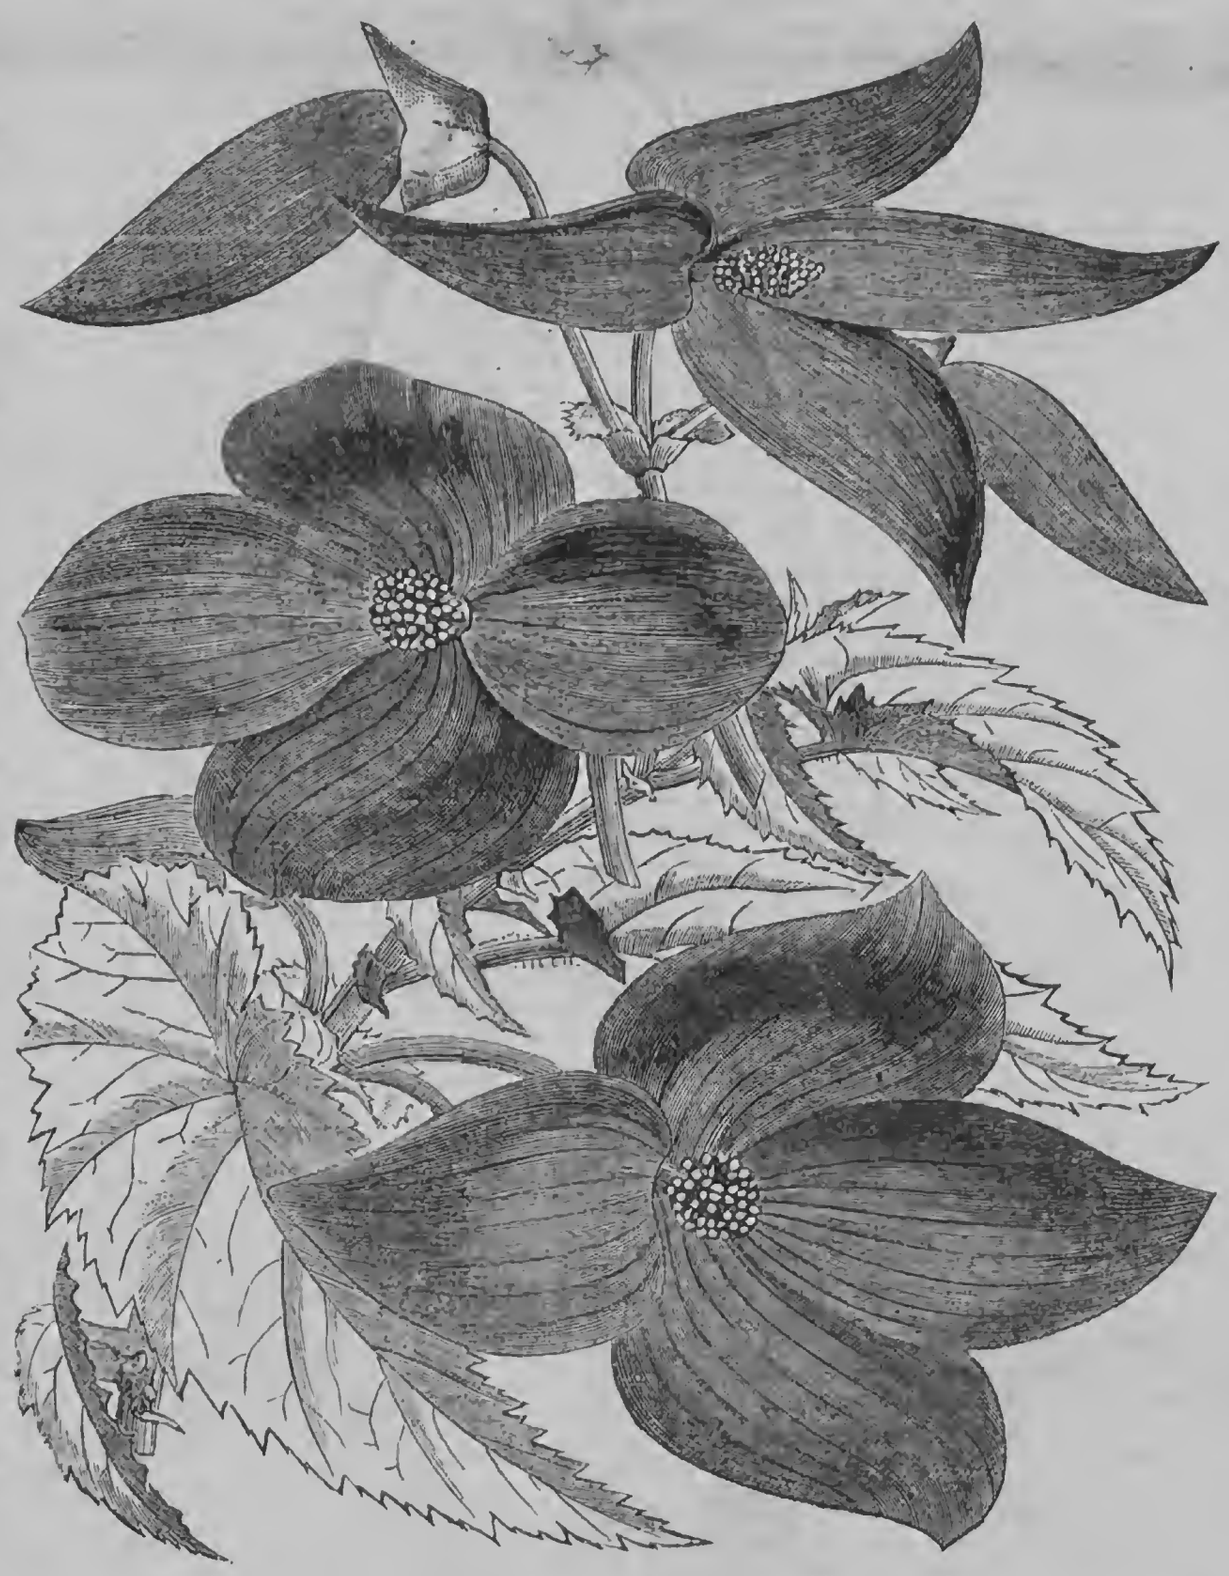
There is scarcely a person deeply interested in plants that does not learn something every season—either in-doors or out-of-doors—not generally known. If such persons, who do not write for publication, would send their information to those who do—many practical suggestions and facts of value might be distributed for the benefit of all. Horticultural writers, who narrate, for the most part, their own experiences, are necessarily confined within comparatively a narrow sphere; and the local causes which operate, either for or against a particular plant, may not exist a few miles distant. Time, however, does not permit a minute investigation of these details, and the remarks or directions in specific cases are often found quite inadequate to general application. In almost every garden certain plants will be found to do well; others to thrive in perfection; still others that sicken and perish. If the details as to the soil, moisture, dryness and exposure were carefully noted and published, we should soon arrive at a comprehensive knowledge of how to improve the plants in our own grounds—what to select—what to reject.

Thus, through the horticultural journals, the whole community might constitute itself a vast Horticultural Society, giving and receiving seeds and information free of expense, and with a trifle of trouble that would be well repaid by the information resulting from the observations which each would feel it incumbent upon himself to make and to record.

Speaking for ourselves, we are always ready to welcome such information, whether of the least or greatest import, and would promise it a careful consideration, and to render it serviceable to our readers according to its value and our capacity.

E. S. CARMAN.

River Edge, Bergen Co., N. J.



TUBEROUS-ROOTED BEGONIA.

COFFEE IN CALIFORNIA.—An exchange says that "recent experiments prove that Coffee can be raised in every portion of California, where the soil is congenial. Snow does not materially injure the plant." It has become more interesting to know what cannot be raised in California than what can.

Farm Economy.

CLOVER AS A SUBSOILER.

The fact is frequently noticed by old farmers that heavy and especially clayey land rapidly becomes hard and compact as the country becomes older, and virgin soil and the mold from decaying leaves is exhausted. For the first few years after clearing the land no difficulty is experienced, large crops of wheat and other grains are grown, and the soil seems to possess unlimited fertility. Farmers who judge of the strength of their soil by its abundance of black loam think there is no end to it. The soil, also, for a while seems dry enough, except, perhaps, in spring and fall. After a while something is found to be the matter. The black mold on the surface is turned to the bottom of the furrow, and in its place is turned up the clayey soil to be saturated with water in winter and spring, and bake and dry in summer heats. In a few years the fields need underdraining—or lacking that, are condemned as unfit for wheat and grain crops, and seeded to grass for meadow or pasture.

Yet such soils are by no means so poor as is generally believed. The elements of fertility are there; but in unavailable forms—locked up in clods of earth which roots cannot easily penetrate. The mechanical condition of the soil is at fault. While the land was newly cleared and unplowed a thick coat of leaf mold covered and protected the surface. Beneath this in the subsoil were decayed and decaying roots of trees, besides myriads of places where the roots had decayed ages before, forming natural water courses through which surplus water made its escape. No matter how hard and impermeable the subsoil seemed, it was permeated with these holes, so that if you dig anywhere in the hardest soil three feet deep, place all the earth on a board so as to lose none, it will not nearly fill the excavation. In making post holes we have often found that, with a four-inch and five-inch post, the earth taken from the hole would not fill around it, and the same experience holds good with drains. This excavated soil is apparently looser, and is really more permeable than originally, and yet it is evident that it has been made more compact than before. It will hold perhaps as much water; but cannot give it free vent through the channels which nature established ages and ages before. Thus the land becomes water-soaked, retaining moisture, retarding decomposition, and generating acids poisonous to the roots and plants. At the same time the surface soil, being unprotected by forests, burns and dries in the summer's sun, and the vegetable matter is washed away by rains or evaporated in the atmosphere, besides being taken up by growing crops. Under such circumstances it is no wonder that the soil becomes cold, "sour" and unproductive. What is the remedy?

A few years ago deep plowing was recommended as the panacea for all the ills that soils are heir to. Thousands of acres were permanently injured by injudicious deep plowing, throwing the fertile surface soil to the bottom of a deep furrow, and bringing the cold subsoil to the surface. This, naturally, didn't work well, and next we were told that the subsoil plow was the specific, loosening the subsoil, admitting air and moisture, and allowing the roots to strike deeper than they otherwise would. Some of these objects subsoiling will secure; but, when it is recommended in order to remove surface water and give a chance for its escape to the subsoil, we protest. Nothing in our experience or observation confirms this view. We have seen many experiments in subsoiling without any appreciable advantage, and some with decided injury to the soil. Both plowing and subsoiling break up the natural water drains which have been established in heavy soil, and may thus enable it to hold more water in a moderately wet season, but with the certainty of making the soil water-soaked and unproductive whenever an excessively wet season comes. When land is thoroughly underdrained these water courses re-establish themselves, as surplus water finds vent through the drains; but it isn't safe, yet, to give general advice fitted only for land that has been underdrained. In the few instances where subsoiling has proved beneficial, they have probably been followed by seasons when there was no more rain than the subsoil could hold without saturation. In such cases subsoiling would probably prove beneficial, as the roots of plants can undoubtedly more easily penetrate soil that has been loosened than that which has not. One other advantage of subsoiling must not be overlooked. It is probably the best possible preparation for the clover plant, enabling its root to strike deep and make a vigorous growth. These large clover roots striking into the subsoil will speedily re-establish the closed water courses, and leave the land nearly as light and rich as when first the forest was cleared from its surface.

Clover, after all, is the safest and best subsoiler. In its decay it leaves rich plant food, which wheat and corn and other roots can follow downward, and, after every particle of nutriment has been extracted, the "hole in the ground," which the clover root leaves, is useful as a drain. It is possible, by the use of clover, to restore the soil to its original porousness, and so dispense with one-half the underdraining otherwise deemed necessary. We believe in underdraining, though it is costly and laborious work; therefore we don't believe in doing more underdraining than is absolutely necessary.

Clover is much more grown on light, gravelly or sandy soils than on heavy loams or clays. Farmers on these last find it difficult to get a good catch. The reason is that the hard, cloddy soil is impervious to clover roots, yet, on getting a good growth of clover depends all hope of success in renovating the soil. All the manure that can be spared should be applied to the young clover to encourage a vigorous growth. With each succeeding clover crop it will be more easy to get a good growth, and the clover roots will strike deeper into the subsoil. Perhaps as a preparation for a clover crop the subsoil plow may do good service; but, excepting for this, it is much better to trust clover alone as the true and safest subsoiler.

THE ABSORBENT POWER OF SOILS.

Sir Humphrey Davy was the first chemist that ever gave a regular course of lectures on agriculture, which were in the first and second decades of this century, before the British board of agriculture in the city of London. He found by experiment that 1,000 pounds of a "very fertile soil from East Lothian, made perfectly dry, gained eighteen pounds weight in an hour," exposed to common air in the city named. A very fertile soil from Somersetshire gained sixteen pounds in the same time. A sandy soil from Essex gained eleven pounds. A soil of Bagshot heath gained only three pounds. One hundred and six pounds of dry quartz sand placed in a proper vessel absorbed twenty-five pounds of water before any came through so as to drop. Calcareous sand (that from lime rock) took up twenty-nine pounds of water before dropping. A loamy soil, forty lbs. English chalk gained, forty-five pounds; clay loam, fifty pounds; pure clay, seventy pounds. Here the practical farmer has evidence where a reliable man found 106 pounds of pure clay, thoroughly dried, probably in a large stove, took seventy pounds of water before one drop passed out of it. Such a soil is too tenacious of water and has an excess of clay. It needs underdraining, and does best in meadow and pasture. A more loamy, open soil that will hold forty pounds of water in 100 of earth is best for all tillage purposes.

The common dryness or dampness of the atmosphere is an important factor in the problem of fertility and plant growth. A mixture of vegetable mold, sand, red clay and lime salts, made pervious to the air by the use of the plow and other implements of tillage, has generally given the best returns in crops, and drawn the most moisture and plant food from the ever-moving atmosphere.

Plants and animals, when they die and rot, fill the air with fertilizing gases: and the cultivator of the soil wants to learn how he may draw manure from the inexhaustible storehouse with the least trouble and expense. Perfect tillage, to condense these fertilizing gases and vapors in the pores of the soil, is the first step in this direction. All plants that grow on dead trees, rail and plank fences, rock and stones, are very cellular and porous. In the granite wilderness of northern New York, deer, moose and elk subsist through long and cold winters on moss, which must contain all the element of their flesh, bones and blood. Gov. Seymour shot a moose, of large size, which in our view of the animal stands out boldly the representaive of fertility, in a sterile region, between almost naked granite and what may be regarded as exceptionally pure air surrounding this primitive crystalline rock. Buffalo and huge elephants once grazed in Tennessee, the unmistakable types of great fruitfulness of soil.—*National Granger.*

PLOWS AND PLOWING.

In times past farmers have thought any plow good enough that would cut a wide furrow and run level. But we notice more inquiry of late, and the better class of cultivators are experimenting with all the new inventions in hopes of finding *one* plow that combines all the merits, and none of the defects so common to almost all now in use. We have had several very good working plows, so long as we could keep them bright and have them scour; but a damp day or two with plow not in use, or even sometimes if left out over night in damp weather, and it could not be made to scour all day in our black, clay loam soils. One-horse plows, especially in fine, well-worked ground, would scarcely ever scour—not doing good work, and, of course, drawing hard. In sheer desperation we have tried every plow recommended by the seller, on condition that if it scoured we would pay for it, and if not, return. Some steel plows would do pretty well, but on certain soils in a dry, mellow condition they would clog. Last spring a very homely plow, made at Albion, Mich., by the Gale Manufacturing Co, was recommended by a party selling it here, and we took it home, without the least idea of being able to use it. We tried it, and kept trying it, but have never found a place where it would not scour, even though left wet a week it does not rust deep, but will scour the first rod—the surface being made so very hard that there seems to be no wear to it, and the rust cannot get hold. We have since seen another make of chill-hardened plows that works nearly as well. These chill-hardened cast iron plows must supercede all others on black, sticky soils. A light, two-horse plow of this kind runs quite as easy for one-horse as an ordinary cast-iron plow for two, and does much better work. We have decided to discard all our old cast-iron plows and substitute those instead. J. B. Jones.

Rochester, N. Y.

Field Crops.

EXPERIMENTS WITH CORN.

Reading an article in a recent number of the Rural New-Yorker under the heading of "An Experiment with Corn," reminded me of my father's experience with corn for the past few years. My story is as follows:—Two years ago last spring I asked my father what kind of corn he intended to plant. "The same kind I did last year," answered he. "Now," said I, "if I was in your place, I would plant a different kind. Uncle has a pretty good kind;" and I told father that I had bought and brought home some for him to plant. I showed it to him. He said he did not like that kind and would not plant it. "Well," thought I to myself, "it will make good chicken feed anyway," and I used it for that purpose. He planted the same old kind he had for years, giving it ordinary culture. From the field of three acres the result was as follows:

EXPENSES.

Plowing and harrowing	$10 50
Marking and planting	5 25
Cultivating and hoeing	15 00
Cutting	9 50
Husking	—
Harvesting fodder	3 00
Total cost	$38 25

RECEIPTS.

Two and one-fourth tons corn fodder	13 50
Loss	24 75

or $8.25 per acre.

Well, the next spring, awhile before planting time, I asked father what kind of corn he intended to plant. "Well," said he, "I guess I shall plant the kind you raised in the garden last year." (I had planted a package of early market corn—a very early variety—for the purpose of having green corn early. This variety grows from three to five feet high, the ears averaging five or six inches in length.) "I want to raise a little corn this year if I can."

"Why," said I, "that kind is not worth planting as a field variety."

"Well," said he, "I haven't any other kind to plant, and I am a going to get a barrel of phosphates to put on it, so I guess it will do pretty well."

Well, he planted it, applying the superphosphate with considerable care. The corn grew so fast, tasseled and cared out so early, that it attracted the attention of the neighbors. They wanted to know what kind of corn he had planted. I told them it was the early *short* kind. They thought it was. Well, that corn got ripe, and from the field of 1¼ acres, the result was as follows:

EXPENSES.

Plowing and harrowing	$4 37
Marking and planting	2 19
Superphosphate	6 60
Cultivating and hoeing	6 25
Cutting	1 87
Husking	1 87
Harvesting fodder	1 25
Total cost	$29 40

RECEIPTS.

15½ bu. shelled corn, at 80c	$12 40
One ton corn fodder	6 00— 18 40
Loss	$6 00

or $4.80 per acre.

Well, last spring, awhile before planting time, I asked father again what kind of corn he intended to plant. "Well," said he, "I guess I shall plant your uncle's kind"—the same kind I had tried to have him plant two years before—"one of the neighbors raised it last year and liked it pretty well, so I guess I shall plant that kind." So he planted that kind, and from the field of 3¼ acres the result was as follows:

EXPENSES.

Plowing and harrowing	$7 87
Marking and planting	3 94
Cultivating and hoeing	11 25
Cutting	3 37
Husking	6 75
Harvesting fodder	2 25
Total cost	$35 43

RECEIPTS.

56¼ bu. shelled corn, at 75c	$42 19
2⅔ tons corn fodder	13 50— 55 69
Profit	$20 26

or $9 per acre.

Father is a farmer of about forty years' experience, does not read agricultural books or papers a great deal, being somewhat old-fashioned in his way of farming. I am scarcely more than a boy, have always lived at home, working as farmers' boys generally do, and a short time before my story commences had subscribed for the Rural New-Yorker and read agricultural books some, picking up what information I could in regard to modern ways of farming. Had father planted the same variety of corn the first two seasons that he did the last, I haven't the least doubt but that it would have yielded as well the first two seasons as it did the last. Allowing this to be the case, it will be seen that the real loss for the two seasons was $69.50—an item of no small importance. And I have come to the conclusion that it does not pay the farmer to farm it in the same old way, year after year, but that it does pay him to try experiments, read agricultural books, and take the Rural New-Yorker.

Young Farmer.

Augusta, Oneida Co., N. Y.

The above experience reminds us of a story which, without meaning any disrespect to any one, we must tell:—A farmer had been greatly troubled by a mischievous sow which, every morning at daylight, was found to have mysteriously conveyed herself into the corn field. No break or gap appeared in the fence, and how the animal got through or over was a mystery. Watching carefully one day, the farmer saw the sow deliberately enter a hollow log of some length, one end of which crooked through the fence. The mystery was solved and the farmer, instead of moving the log, tried the experiment of building the fence so that both ends were outside the field. The next morning the farmer secreted himself where he could watch the result. In stepped piggy as usual, but a moment after emerged at the other end, on the *wrong* side of the fence. With a grunt of astonishment, the sow deliberately walked to the other end and repeated the operation. With a bewildered and amazed look, first at the log and then at the fence, piggy started on a brisk trot for the pen, and no amount of driving could ever bring her near that part of the field again.

There are a good many farmers who, unlike our correspondent, will continue growing a crop year after year, though every time the final result is being on the wrong side of the fence. If a farmer will not discard unprofitable crops, unprofitable varieties of grain, unprofitable stock and implements, is it not fair to say of him that he does not know as much as an ordinarily sensible hog? Two years is long enough for a man to grow a crop which, in ordinary seasons, will not pay the expense of its production.

SOME LARGE CORN YIELDS.

Wherever there was enough warm weather the past season, the crop of corn was enormous. There seems to have been a large growth of stalks nearly everywhere, but in some localities the grain failed to ripen. The Missouri Patrons of Husbandry offered a premium of $200 for the best corn crop. Fifteen farmers competed for the prize, and the number of acres and yield per acre in ears, are given below:

	Acres.	Bu. per Acre.
A. F. Brown	11	124
Jno. P. Martin	45	115
Vincent Marmaduke	20	105
A. Snody	30	100
Jno. Spears	30	100
W. B. Johnson	20	108
O. J. Ralph	30	100
M. A. Gualdin	60	97
Robt. Smith	50	97
Jno. Robinson	30	93
David Cockrill	12	86
Jno. Stoler	40	85
Benj. H. Hawpe	20	77
Craig Hays	20	75
M. T. Chartain	12	75

The Western Farm Journal, commenting on these results, says:—"In one case only was manure used; some of the crops were plowed only twice and rolled and harrowed each once; some were plowed four times and hoed once; some were worked with cultivator, and some with the plow alone. The plowing was not deep—only four or five inches; in some cases the grain was planted in drills, 3½ feet apart and 12 to 20 inches in the drills: in others it was planted in hills 3½ feet apart each way. The record states that the premium crop of 124 bushels per acre, exhibited by Mr. A. F. Brown, was raised on old ground broken up five inches deep once, laid off and planted without being harrowed—the grain being drilled 20 inches distant in the rows and the rows 3½ feet apart and covered with a hoe. When it came up it was harrowed, then rolled, worked twice with a cultivator and "laid by" with a plow by throwing the soil to the stalks. It is fair to presume that these figures would be reduced about 20 per cent. if the corn was re-weighed in the spring. We suppose it was weighed, although the fact is not stated."

Dairy Husbandry.

THE N. Y. DAIRYMEN'S CONVENTION.

LEADING POINTS IN THH PAPERS AND DISCUSSIONS,

The New York State Dairymen's Association at Norwich, may be regarded as one of the most successful and useful meetings for the advancement of dairy husbandry of any that have been held in the State. The majority of the papers read were eminently practical, while science was brought to bear upon many points in such a manner as to make the arguments more clear and convincing to the educated mind. We have no space to give the several papers and discussions in full, but shall briefly notice some of the more prominent features of the topics brought forward.

SOILING.

The leading idea in the paper by Dr. Crafts of Binghamton, was that it was more economical to soil than to pasture cows. Soiling saves land; it saves fencing; it economizes food; it keeps the animal in better condition and greater comfort; it increases the quantity and quality of the manure. These were the points urged by Dr. Crafts, who contended that his experience in soiling abundantly proved the aforesaid propositions. He referred to his management of a pure-bred Jersey which he had soiled during the past season at Binghamton. The basis of the food employed was grass and grain. She was well fed but not over-fed, and all surplus food was removed from the manger, leaving none to sour. His conclusions were, that by having comfortable stables and giving the animals good feed and care, the product of cows in the State by soiling could be increased 33 per cent.

Mr. A. L. Fish of Herkimer said he did not think soiling, as a general rule, would pay dairymen; but in times of drouth or scarcity of pasturage, it could be adopted with profit. Gen. Jones of Binghamton said cattle that are kept solely by soiling from year to year, degenerate. He approved of the system of half soiling or feeding green crops in time of drouth to supplement pasturage. Mr. Fish was an advocate of sowed corn for half soiling, but the corn fodder must be fully matured. Prof. Roberts agreed with Mr. Fish, and remarked that sowed corn fodder, when it is not matured, is not much better for feed than cold water. In answer to the question of loss of health from want of exercise when the practice of soiling is adopted, Mr. Bliss of Vermont said this could be obviated by having a short range, where the animals may be turned from day to day.

THE COW AND HER MANAGEMENT.

was the subject of an elaborate paper by E. W. Stewart of Buffalo. Mr. Stewart is in favor of soiling and has practiced it to some extent upon his farm. Clover is regarded as an important soiling, crop, and in testing its value, he found the crop grown on a quarter of an acre was sufficient to feed a cow 150 days. When everything is made convenient for soiling, the labor expense is much lighter than many suppose. Years ago when labor was cheap this item amounted to only $75 for soiling a herd of 45 animals during one entire season. This seemed to be a very small sum to many in the Convention, and we should have been glad to have had a fuller explanation on this point than was given by the speaker. Mr. Stewart, in the course of his remarks, alluded to a point of much importance in the feeding of stalks which was, that farmers should study how to mingle the proper constituents of food, so as to make up a nutritious ration. In soiling, it is important that the animals have not only the best kinds, but they should be furnished in variety. In explanation of this, whey was taken as an example. Whey contains the sugar of milk which will make fat but not bone and muscle, but if it be mixed with pea or oil meal, the lacking elements are supplied and the mixture becomes a nutritious ration. He made some very good suggestions in regard to breeding animals for the dairy, and said the experience of dairymen will show that by selection the best milking stock is obtained. The milking habit of the Short-Horn had been bred out by selection—this had been resorted to by one class of breeders whose object was to make beef, but there was another class that bred for milk. He deprecated the practice of some breeders who fed and pampered their stock to excess for the purpose of making show animals.

Though the subject of winter dairying was not discussed in detail, yet from some general remarks, we rather inferred he was in favor of this practice, since the statement was made that a cow coming in milk in January if properly fed, will give 1,000 pounds more milk than if she came in milk in May, and the reason given was because, when turned to grass, the flow of milk starts up again, and thus her milking capacity is increased. Others have stated the same, among whom we may mention Mr. Boies of Illinois, who has had great success in winter dairying.

Mr. Stewart very properly urged that cows should be full fed, and that you could not starve a cow without loss. Mr. S. advocated an improved plan for barns. His model is, in shape, an octagon. It is built with concrete walls, so as to have no interior timbers. The concrete walls do not conduct frost like stone, and the stables are warmer in winter and cooler in summer than when built of other material.

BREED AND FEED

was the subject of a well written paper by Prof. J. P. Roberts of Cornell University. He said we should carefully consider the object in breeding whether for milk or beef. To understand this question of breeding, we must go back to history. He then gave the history of the Short-Horns, which he thought were not well fitted for the dairy. The high price of beef was the first incentive to high breeding. The Short-Horns of a hundred years ago were a milking family. Bates and others picked up stock of doubtful pedigree and improved them by care. All who have established a reputation for breeding have accomplished their ends first, by selecting the finest animals; second, by weeding out inferior animals; and third, by caseine. He had searched in vain for cows possessing such good milk and beef qualities as those bred by Bates. The pure Short-Horns of to-day are not good milkers, they are too high-priced and too liable to barrenness. We are already possessed of animals with a mixture of many different breeds. Let us select the best of these and improve upon them. We can breed from these an animal suited to our fancy by selecting males from the different breeds. It is a mystery why some farmers will persist in breeding from inferior stock. The business of breeding thoroughbreds should be a separate or special occupation. Animals designed for breeding purposes are not unfrequently confined too closely, and the result is disease or want of vigor; hence the animals either die or are unfit for breeders.

Upon the question of feeding he thought that artificial means should be employed in warming the food and drink of the animal during cold weather, and he showed by mathematical demonstration that the cost of heating water in the stomach of the cow by means of grain or other food, was $32.72, while the same could be heated by steamer or coal for $7. He called the attention of dairymen to the fact that with this great difference in the cost of the process, it behooved them to warm the water and cook the food for their stock. The practice of allowing cows to stand exposed to cold and wet weather and in giving them ice water to drink, was severely censured. He gave an account of the manner in which cows are fed at the University stables. The daily rations for large cows giving milk, were 25 pounds of hay, 7 pounds of meal and 2½ pounds of bran. Upon this feed a cow could be kept in high condition, yielding a large amount of milk. He deprecated the practice of some farmers in trying to find out how little a cow could be kept alive on instead of how much she could be made to eat. He urged the latter course in strong terms.

A spirited discussion followed this address, which was participated in by Hon. Harris Lewis, Mr. VanDuzen and others, the points objected to in the address being the cost of heating water by feeding the cow, and the amount of feed employed at the University for cows in milk.

The leading points in the addresses of the second day of the Convention we shall refer to hereafter.

PENNSYLVANIA DAIRYMEN'S ASS'N.

PROCEEDINGS OF ITS FIRST ANNUAL CONVENTION.

Meadville, Pa., Dec. 30, 1875.

As an instance of the progress made by the Butter and Cheese Interest of this State, a few figures will not be inappropriate.

Crawford County has now in successful operation 101 factories, employing 300 skilled operatives, who utilize the milk product of 30,000 cows, amounting in cheese alone, this year, to nine million pounds. This represents part of the income of 5,000 farmers.

The Annual Convention of the Pennsylvania State Dairymen's Association, now in session at the County Court House, was called to order at 11 A. M. promptly, and the business of the

FIRST DAY

began by the organization of Committees on Constitution and By-Laws, on Nominations, Dairy Utensils and Dairy Products.

The opening address was then read by the President of the Association, Mr. A. M. Fuller, in which he concisely reviewed the prospects of the Dairy Interests of the State. He strongly recommended concentrated action as the only successful way in which to meet the fierce competition of other sections, and urged a more hearty support of the Board of Trade as the the most efficient instrument to establish steady sales and secure a reputation for the dairy products of Pennsylvania that will place them on an equal footing with Eastern competors. He deprecated the rivalry existing between factories as inimical to their best interests. He would advise that the practice of factories buying milk be discontinued, but if persisted in, let it be done by the methods that obtain among Eastern factorymen, that is, base the price of the milk on the ruling quotations of the cheese market on the first of each month, thus relieving factorymen of a speculative interest in the products of their factories.

He also suggested that instead of Patrons electing a committee to act as salesmen, there should be one salesman appointed to each factory who should be given full power to use his individual judgment in selling the product of his factory, thereby avoiding the vacillation and uncertainty that has characterized the sales of the past season, to the great pecuniary disadvantage of the producers.

It is of the first importance that their cheese should be branded, in order to establish its reputation on its intrinsic merits, and not permit it, as heretofore, to be sent to market and sold as N. Y. State cheese. He commends the spirit of the Pennsylvania dairy interest in scorning to make skim cheese, adding that such a proof of honest dealing must redound to their advantage, and in closing predicted a halcyon future for the interest in this State.

H. Canfield, of Crawford, in commenting on the President's remarks, said that he substantially agreed with him that there should be co-operation on the part of the factorymen, and he was also in favor of the Association fixing the price at which cheese should be sold. Although in favor of cream cheese, he was compelled to make skim cheese.

Mr. Bigger moved that a Committee be appointed to draw up a plan for the united action of factorymen, which was seconded by H. C. Green of Meadville, and the Chair appointed the following Committee: Mr. Canfield, Hiram Nash and Wm. Morse, all of Crawford County.

J. H. Reall of Philadelphia was present by proxy, sending a letter congratulatory of the aims and success of the Association. He thinks Pennsylvania cheese is being improved rapidly and will soon be the best made, and attributes the low price of cheese to the poor quality of the product. Skimming has reached its bounds, and he lays the blame of this innovation on the dairymen rather than on the factorymen.

N. W. Miller, Stockton, N. Y., read his essay on

MEAL FEEDING,

prefacing his facts by the remark that he had generally been denounced by the press as a homeopathic meal-feeding lunatic, but he could only say, in his own behalf, that he had either drawn wrong conclusions from his own experiments or he had made a discovery that would revolutionize the dairy interests. He believes in his theory, and submitted facts as a radical test.

Wm. H. Whitney of Bladensburg, Iowa, wintered four two-year olds on exclusive meal diet last winter, the animals being in good condition and fattening unusually quick on grass the ensuing spring. Mr. Beadle of Carter, Ohio, fed two cows ten weeks, as an experiment, and found that they thrived quite as well as the remainder of his herd fed on the usual winter diet. John Adams, Ingersoll, Canada, fed a large herd ten weeks exclusively on meal, as the weather was exceptionally cold and the stables uncomfortable, he fed four quarts daily. They did well on the diet, and in some respects better than when wintered on hay. These results, in connection with those gathered by himself, he thinks establish the practicability and desirability of exclusive meal feeding in preference to hay when cows are dry. He found that feeding meal for three consecutive weeks produced remarkable results in developing the milking capacity of his animals. He fed two quarts meal and what hay they would eat. After dropping their calves, and until turned into pasture, they averaged 1½ pounds butter daily—the highest average when wintered on hay—but with same spring rations, never having exceeded 14 ounces daily. His herd are Natives. During the cheese-making season of 1873 wintered on hay, daily yield being 16 pounds; the past year fed meal exclusively and produced 27 pounds daily, the pasture being about equal for the two seasons and feed in both cases being grass. His herd averaged the present season 425 pounds cheese, ¼ skimmed, and 100 pounds butter. Other herds whose produce was sent to the same factory, but were wintered on hay, made no corresponding increase. He also claims that cattle will make much better beef, and whilst feeding remain in much better general health under this system, and that results have shown that the system is the best for the improvement of stock.

A discussion arose as to whether the animal kept her meal in the first or fourth stomach, in which Prof. Arnold took part. But as this matter concerns the animal herself almost exclusively, it will have to be determined when an intelligent cow can be found who will give in her testimony. Opinions varied. The address was followed by desultory remarks. Mr. Flint Blanchard of Jamestown suggested that dairymen try meal feeding, selecting the poorest stock. A motion to adjourn to 2 P. M. was made and carried.

AFTERNOON SESSION.

After the meeting being called to order by the President, Mr. Cornelius Baldwin of Nelson, Ohio, was introduced, who then read a paper on

BREEDING AND SELECTING DAIRY CATTLE.

The essay was illustrated by crayon drawings of eight cows, said to represent the best and poorest of their kind for dairy purposes. They were Ayreshires, Jersey and Natives. There were also displayed, as illustrative of the text, drawings of the escutcheon, or milk-mirror of cattle. He thought if milk could be produced in larger quantities it would benefit both consumer and producer, and to do this great care should be used in selecting cattle. There are a number of signs by which dairy cattle, good and bad, can be distinguished, and although Guenon has made the most important of all discoveries in this connection—the milk mirror—the speaker has elaborated the subject to the extent that he feels justified in claiming some of the facts set forth as purely his own discoveries. This subject, he thinks, is not as well understood as it should be by farmers. Color was not very significant, but cattle, purely black or white, are not, as a rule, good stock for the purpose, Holsteins being exceptions. There are, however, three or four signs that are infallible, and dairymen should be content only with the combination. Size is important, and should be from medium to small. A good disposition is a prime requisite in cows and women, and this, he said, was comprised in a temperament that was sprightly, nervous and active, yet docile. Sluggish cattle are inferior for dairy purposes, and this is important as bearing on the selection. There are but three breeds in this country that deserve mention for the purpose under consideration—Ayrshires, Jersey and Holsteins—but few native cattle being up to the requirements.

In the near future, however, the natives, by judicious selection, will be among the best for dairy purposes. It is all a matter of careful selection, guided, of course, by the advice given below. It is noteworthy that good dairy cattle are thirsty, constitutionally thirsty animals, and are the first to lie down, last to rise, and utilizing their food thoroughly, are not difficult to keep. The head should be small, indicating small bones, clearly cut, with muzzle large and flattened; lips thick and protruding sidewise; neck should be clean cut, long and well jointed to shoulders; withers thin and of good breadth below the shoulders. The horns are not deeply corrugated, and are of a waxy, lustrous appearance. The body should have a general look of "bagginess" and be wedge shaped, the broadest part being the posterior; the tail must be long and bushy and the tail bone attenuated. It is also important that the carriage of the animal should be proud, erect and stately. A double chine is a very good indication. Milk veins shou'd be distinctly marked, knotted in places, and make a series of abrupt angles in their course. A short-bodied animal is one of the best, the milk secretions being larger the nearer they are to the heart. He instanced a physiological parallel in the human. The veins should be clearly noted on both sides the animal.

The milk mirrors are undoubtedly the best guides in selecting dairy cattle, it being possible to determine even how much, how long, and the quality of milk that a cow will give. This was very clearly illustrated by a series of pieces of hide cut from animals who possessed these peculiarities and which presented varied and marked characteristics of the escutcheon, that are difficult of explanation without illustration, and which exemplified the gist of his views on the subject. He suggested, in closing, that a new standard of judging dairy cattle, based on this theory, should be established, and premiums awarded therefor, thus closing perhaps the most original paper of the meeting.—[Conclusion next week.

CURE FOR A SICK COW.

For the benefit of my brother farmers' by whose contributions I have been much benefited, I will send you a recipe for the cure of a bovine which has taken cold or lost its appetite in any way, and it is also good for the disease termed "Hollow-horn" or "horn-ail." Take two pieces of salt pork, about the size of the two fore fingers, split them open and put in each a teaspoonful of cayenne pepper, stand on the right hand side of the animal, and elevate the jaws with the left arm, and put the pork between the grinders with the right hand, keeping the jaws elevated till the dose is chewed and swallowed, only putting in one piece at a time. After they are administered give two more pieces of the same size if you choose without the pepper, and if the animal seems affected by cold, give water with the chill taken off to drink and put on a warm blanket. I have no doubt that I saved the life of a valuable cow by the above proceeduro.

Weston, Allegan Co., Mich. H. D. Edgerton.

Reports from Dairy Associations.—Our aim is to give at least a synopsis of the proceedings of all prominent Dairy Associations, Conventions, &c., and for that purpose the Rural had representatives at most of the meetings recently held. We shall be glad to hear from the officers of other associations.

The Swine-Herd.

FEEDING OF YOUNG PIGS.

An experienced farmer, with whom we recently conversed, said he always had good luck with pigs, and a visit to his sties confirmed the assertion. Some notes on his management can hardly fail to prove interesting.

The prevalent idea that pigs should be kept constantly growing is a good one, but liable, nevertheless, to mislead. It is not best to stuff pigs as full as they will hold, and especially those just weaned. The sucking pig gets his rations often and in moderate quantities of food the simplest and most easily digested. The sow's milk is full of flesh and bone-forming material, and promotes a steady, uniform growth, building up a frame without too great accumulating fat. Weaning time is naturally and justly regarded as a critical period, and here is where farmers are apt to err in high feeding with rich and concentrated food. Cow's milk is excellent, and if most of the cream has been skimmed off it probably comes nearer the pig's natural food at this tender age than any other. But milk is rejected as not rich and "fattening" enough, and corn meal, the most concentrated kind of food, is substituted in its stead. Now corn meal is altogether too difficult of digestion for weaning pigs, and at most should only be given in small proportions. With an exclusive corn meal diet the young pigs will stop growing longer or larger framed and begin to pile on the fat on carcasses too small for profitable feeding. A great deal better plan is to continue feeding milk, and this sparingly, adding a little bran and a very small quantity of corn meal. This last can be increased as the pigs become accustomed to the change of diet and their stomach will bear a stronger food. The wheat bran and skim milk supply the phosphates which build up the pig's frame, while a very little corn meal will supply the fat-forming material which is taken from milk in cream, and at a greatly reduced cost. At no time should pigs be starved or stinted, but it is important to remember that pigs may be dwarfed by feeding too much and too rich food and with as bad results as from feeding too little. Great care is needed in feeding any kind of very young animal, and the pig, being especially piggish in his greed, is particularly liable to injury from eating too heartily. With all young animals growth rather than fat should be aimed at, and phosphatic foods should be given as far as possible. Corn in every stage belongs to the last and fattening stage of feeding of any kind of stock, instead of being used indiscriminately for stock of all ages.

WEIGHT OF PIGS FOR MARKET.

It was only a few years ago that swine breeders were vieing with each other for the greatest weight of carcass; but this is now all changed. Hogs that will weigh 500 pounds are sold at a less price per pound than those of 250 to 300 pounds. The market in England has long favored light weights. London is chiefly supplied with pigs of less than 200 pounds weight. And this tendency of the market to pigs, well fatted, but of small weight, is just what the farmer should encourage, for it is exactly in the line of his interest. It costs more to make the second hundred pounds of a pig than the first, and still more to make the third hundred pounds, and so every pound added becomes more expensive.

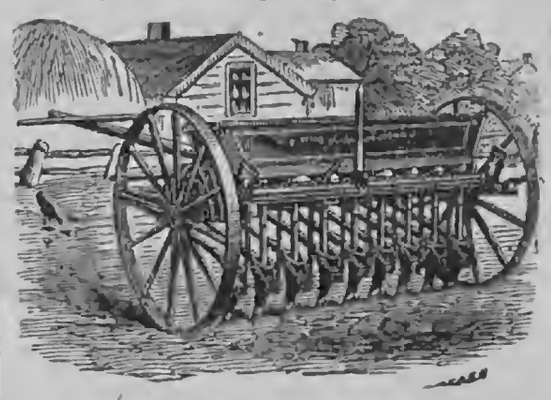
Several years have proved that well fattened pigs of 250 pounds weight find the greatest favor in the market, and this fact should change the whole system of pig raising and fattening. Instead of keeping them till eighteen to twenty months old, they should never be kept beyond twelve months, except for breeding, and seldom beyond nine or ten months. The great effort should be to induce early maturity in our pigs and thus shorten the period of feeding, and consequently lessen the cost per pound of producing pork. This is a matter of much greater importance than pork raisers generally realize. We think any well-conducted experiment would show that ten pigs carried over the winter in store condition, as is usual, and fattened at eighteen or twenty months, cost, per pound, of live weight, twice as much as another ten of equal quality, full fed and fattened at nine or ten months. There would not be so much difference in cost per pound if the pigs were full fed for the whole eighteen or twenty months; but even then the difference would be at least fifty per cent. in favor of early maturity. And this matter of early maturity is entirely within the control of the breeder. A cross of Berkshire, Essex, Suffolk, small Yorkshire, or other early-maturing breeds, upon our best common sows, will produce the desired result. But this system has no period of strong animals; it must be one constant progress from the first to the last day in the life of the pig.

Cure for the New Hoo Disease.—We have recently published reports of a new and dangerous hog disease now prevailing in the Western States. Hon. T. C. Jones of Ohio, publishes in the Delaware, O., Gazette, the following preventive treatment with directions what to do in case of an attack:—"A mixture of one peck of ashes, four pounds of salt, seven pounds of copperas, and one pound of sulphur, kept constantly in a trough, is of great service. If predisposed to cholera, hogs will eat it more freely than when free from all symptoms. If a hog gets down, try to get into him a gill of coal oil in slops; it has sometimes been effective when other remedies have failed."

Our Premium Articles.

THE FARMERS' FAVORITE GRAIN DRILL.

The Rural New-Yorker "believes in" drilling grain, and it is only in continuation of its every-day work in improving the methods of



farming, that its Publisher has made arrangements whereby energetic farmers may possess themselves of a first-class Seed and Grain Drill, by securing subscribers to the Farmers' Favorite Journal. Among Grain Drills, the Farmers' Favorite is that manufactured by Bickford & Huffman, Macedon, N. Y., and frequently commended in the Rural columns. It has a fertilizer attachment, distributing guano, superphosphate, plaster, or any finely-divided manure *with the seed*, so that the plant has a vigorous growth from the start. A small quantity of manure distributed in this way will often double the crop, and will always much more than pay the cost of applying it. One of these drills with fertilizer attachment is an important and almost necessary article for improved farming, and whoever procures one in a neighborhood, can make a handsome income every year by hiring it to neighbors at 25 to 50 cents, or more, per acre. We are able to offer these drills made in the very best style, with all the attachments, costing $130, for 130 subscribers at $2.15 each, or 80 subscribers at $2.65 each. Thus, at our lowest club rates, each subscription counts one dollar towards the price of a superior grain drill, an article which, on your own and neighbors' farm, will pay for itself within two years after purchasing.

THE WARRIOR MOWER.

The spirited engraving of this implement represents a scene pleasantly familiar to Rural readers. The Warrior Mower is deservedly popular

THE WARRIOR MOWER.

and is known in all sections of the country. Manufactured in Little Falls, N. Y., under the personal supervision of the inventor, it has the guarantee of both parties that none but the best material shall be put in each machine, and it is warranted, therefore, to be perfect in its kind, as are all the implements manufactured by this Company. The tilting lever, enabling the operator to turn the guards up or down at will, is an important feature of this machine. Its inclosed gearing, keeping out dirt from the running machinery, is another. Those wishing one of the very best of mowers cannot procure it more easily or more cheaply than by securing 75 subscribers to the Rural New-Yorker at $2.65, or 115 at $2.15, and receive a two-horse Warrior Mower as a premium, or for 70 subscribers at $2.65, or 110 at $2.15, we will send one of their celebrated one-horse machine.

The Herdsman.

SUGGESTIONS ABOUT FATTENING ANIMALS.

A correspondent of the New England Farmer writing from France, sends some curious and interesting speculations as to the effect of shearing or clipping animals intended to be fattened. It is not probable that the effect is marked enough to be of practical importance, though the experiment can be easily tried: of course, waiting until warmer weather before nature's covering for animals is removed. That sheep unsheared do not thrive as well is explainable by the fact that a heavy coat of wool in summer, keeps the animal uncomfortably warm. Also that it holds and retains wet next to the skin of the sheep after heavy rains. With these comments, we give the correspondent's suggestions for whatever they may be worth. He says:

Experience attests that sheep when shorn fatten more rapidly than those left in the possession of their fleece; horses lean or even sickly put on flesh quickly if clipped in due season and with the ordinary precautions. Animals thus treated acquire an increased appetite, and maintain the desire for more food for a longer period. M. Weiske of Proskeau, has conducted experiments with great care to test the facts found to be true by practice. He selected two full grown merinos, in good health, equal in age, and nearly so in weight. They were fed on 2¼ lbs. of meadow hay, ½ lb. of crushed barley, and less than quarter of an ounce of kitchen salt daily; their solid and liquid excrements were specially preserved, and frequently analysed contemporaneously with their food; they were supplied with a fixed quantity of water daily, and were weighed every morning; the temperature of the building during the experiments was nearly uniform. After being thus treated for seven days, no perceptible difference was discovered in their relative weights. After an interval of ten days they were shorn; the appetite which had appeared languishing suddenly became sharp. The shearing exercised little influence on the digestibility of the food, and any difference was unfavorable to the shearing; on the other hand, the animals consumed less water, pulmonary and insensible perspiration having diminished as in practice is known to be the case. But more nitrogen was eliminated, that is, less went to the formation of meat, though no change had taken place either in quantity or quality of food. Shearing then is apparently unfavorable to nutrition; the loss of the fleece is the loss of so much heat, demanding the greater consumption of food, in other words producing a more vigorous appetite. For draught animals, this result is beneficial, for it stimulates the sources of strength; horses when clipped become more energetic, lively and robust, and if they display an improved condition without any change in rations, the cause must be sought in a better appetite or superior assimilation of food. In the case of fattening stock, if this power of assimilation be a little less, the amelioration of the appetite is a compensation, for the animals will thereby put on more flesh, and to maintain the appetite in an excellent state, during the finishing stage of fattening, is the object to be realized. More food means thus more beef and mutton, and hence the advantage of the shorn over the unshorn animals.

MAKING THE MOST OF A STEER.

At the abattoirs of New York there is nothing of a steer lost after it is slaughtered: every part of its substance is used for some purpose, even to the blood. The handling of the bullocks after they are penned up for slaughter is thus described by a correspondent of the New York Bulletin:

"The way they kill a steer is this:—A man gets in behind the steers and throws a rope around the hind leg of one. Then he signals two men who pull on a windlass till the head of the steer is above the ground. Then the throat is cut and the blood flows into pans. A steer generally gives three panfuls of blood. Then the lot of savages—the skinner, legger and entrail drawer—pounce upon the carcass as a very hungry man assails a beefsteak, and in a very short time it is a carcass of dressed beef, ready for market. The butchers pay rental for pens for storage and slaughter, and bring their stock over the Pennsylvania Railroad.

"The Abattoir Company make everything pay profit. They salt the hides down long enough to set the hair. Then they shake out the salt and ship them to Europe and all parts of the United States. The unsalable portions of the hides are made into glue, the horns into buttons, combs, etc., and the inside of them into bone lime; the bones into various articles of commerce. The fat is rendered and the offal made into a fertilizer at The Meadows—a station about four miles out on the road from Jersey City, where the hog abattoir and the repair shops are situated.

"The blood is poured from the pans into iron tanks and run under a chute pipe to cook. It goes up an elevator and down the chute, then to a dryer, and by various systems of manipulation finally reaches the stage where it is reduced 60 per cent. and contains 17 per cent. ammonia. It is almost an impalpable powder, and is worth $50 per ton. This place turns out a ton and a half of it per day.

"The Abattoir Company do not allow anything—hides, pieces, bones, horns, blood or offal of any kind—to be thrown away, because there is money in every particle of the beef. They have the offal and bones carted away to their destinations—the bone factory and fertilizing establishment—immediately upon the accumulation of a car load, and the place is cleaned up every day.

"The theory that filth congregates about an abattoir, or that the river is filled up by the offal thrown overboard, is dispelled by the facts. The Board of Health of Jersey City are convinced that there is nothing about a well-conducted abattoir that is deleterious to the public health."

Pomological.

ENGLISH LATE APPLES.

Mr. Pyrus Malus in English Journal of Horticulture says:—Good keeping apples are the most useful of fruits. A store which lasts in good condition month after month, in the spring and summer period of the year, is a store of great value. This is the period of the year to test the relative value of varieties. If they keep until now in a fresh, crisp state, they are worthy of honorable mention. Even as much so—dare I write it—as are sweet scented roses. Which are really the best late sorts? I mean those which bear well and keep well without any special care. It would be interesting, and particularly useful, if those having, or who have had until recently, sound apples, could let us know their names and a sketch of the conditions under which they have been preserved. Mere size is not so much an object; neither is a very high standard of quality to go for too much at this season. Free bearing, late keeping, good, useful apples are the kinds of which I think information would be acceptable. There is no difficulty in having good apples in the winter, but we want them now and until apples come again. What are the best for culinary purposes and for dessert? I, for one, should be glad to know, and I feel sure the information would be generally acceptable. Three apples, which for a number of years I have found the most valuable, are Sturmer Pippin, desert; small, free bearer, and keeps fresh in a dark and not too dry cellar, throughout June. Striped Beefing; large, sunny side, red, a good bearer and sound until June. Gooseberry apple; medium sized, great bearer, very firm throughout June, and often useable until August. What is the experience of others with these and other sorts?

Look out for the apples about these days, and sort out those likely to decay.

The Apiarian.

WINTERING BEES IN THE NORTH.

Mr. John Voight, of Brown Co., Wis., writes to the Bee Keeper's Magazine, of his plan for wintering in the cold latitude of Northern Wisconsin: "I had no straw handy, for I am not a farmer, but I had some very dry hay. I put one foot of this hay on the floor of my bee-house, set my hives one foot from the wall and about eight inches apart; the holes in the honey boards I left open. I filled the caps with hay and put them on again, leaving the entrances wide open. I then packed hay behind and between the hives, and at last I put about one foot of hay on top of all of them, so that nothing but the front could be seen. As every one knows, we had an *extremely* cold winter, and for a time I lost all hope of ever seeing my bees fly in the yard again.

"As my bee-house was very tight, I gave it a little ventilation on top, and when the first mild night in spring came, say about zero, I opened the door for a few minutes and let in some fresh air, for the hay had begun to smell very strong.

"I give you the temperature of some of the coldest days at this place last winter:—Dec. 31, '74, 22 deg. below zero; Jan. 5, 1875, 22; Jan. 9, 35; Jan. 14, 23; Jan. 19, 20; Jan. 31, 20; Feb. 6, 20; Feb. 7, 32; Feb. 8, 24; Feb. 9, 44; Feb. 12, 34; Feb. 13, 22; Feb. 14, 20; Feb. 15, 25; Feb. 16, 24; also some days in November the mercury went 30 degs. below zero, and in March from the 17 to the 20th, 9 to 11 below zero.

"I had lost all hope. I thought my bees would be a solid mass of ice, but when in the latter part of March I went into the bee-house, very slow and listening, behold! all my bees were humming very strong and vigorously. Then I got new hopes, I took the hives out about the middle of April, and found the hay in the caps next to the honey boards dry; but that on the top moulded, and to my surprise all my bees strong and in the best possible condition. In a few hives I found some molded combs, but not enough to speak of. My neighbors lost all their bees. Along the Green Bay and Minnesota R. R. the farmers lost heavily; and everybody was astonished that I had saved all of mine."

The Magazine adds these comments on the above: "The report is valuable as showing that with proper care bees may be, and are, safely wintered no matter how cold the climate. The discriminating reader will notice that in all these reports of successful wintering, whether in bee-houses, cellars, or on summer stand, the same principle is kept in view—a moderately warm temperature, a small but constant supply of good air, and sufficient of good absorbing material to keep the bees perfectly dry. Had Mr. V. closed up the holes in the honey board, instead of leaving them open, the result would most probably have been dead bees in a mass of moldy combs, and had he failed to pack the dry hay on the honey boards, and all over the hives, his bees would have frozen. A little free ventilation below, and none, except through the absorbents above, seems to be the real secret of success.

TRANSFERRING BEES.

Mr. W. F. Lewis of Baldwyn, Miss., gives us his experience in the Bee World:—Like most Southern bee-keepers, I am a beginner. Last spring, a year ago, I had six colonies black bees in box hives. I transferred them in movable comb hives, Italianized half of them, and increased to twelve, and took about two hundred or three hundred pounds comb honey. A swarm issued from one of the Italian hives about the first of September, filled up its hive, and came through the winter in as good condition as any. During the fall and winter I bought about thirty stocks, in boxes and round gums. These I transferred at various times along through the fall and winter, except a few of the strongest which went till spring. From this experience I would not transfer good strong stocks in winter, but if scarce of stores I would do so in order to feed them successfully. I only lost one or two weak ones, and I think they lost their queens, as they swarmed out and went into other hives, leaving honey plenty. I have increased to seventy, about one-half Italians.

The yield of honey has not been as good as I expected; only about 1,000 lbs. from twenty of the strongest.

I made my own extractor. I don't see why any one should send off and pay $15.00 or $18.00 for an extractor, when one can be made at home in a few hours that will answer just as well. I use a brandy barrel, sawed off the right length, and waxed, for can. The revolving frame is composed of a small iron rod and sundry pieces of hoop-iron bent so as to make the frame of the size and shape wanted, and soldered to the rod. The gearing is that of an old Common Sense Sewing Machine, (can be had for nothing in this country,) and is just the thing wanted. About two square feet of wire cloth is all the material that need be purchased, and it costs but a trifle. I have a little circular saw for making hives. It costs but a small amount, and is a great help in hive making. At first I had trouble to get suitable frame material, and had to send to Mobile for it. I now find it can be sawed at any of the country saw mills out of poplar or cypress that will do as well as any.

The Centennial.

RAILROADS AND THE CENTENNIAL.

We don't know whether the long-headed men who manage railway affairs appreciate the interest which people in all parts of the country take in the Centennial. Farmers and their wives in far-distant States, who have never before been East, talk of coming to see the great show, and most of them also intend to visit the Metropolis on their way there or returning. We expect in this way to meet many correspondents, agents and other friends of the Rural during the Centennial year, and will be "at home" to all who call. A good many of our Western friends are from New York or other Eastern State, and all have many friends or acquaintances here. The scenes of boyhood and girlhood will be revisited, and happy are those whose parents live to extend cordial greeting to children who years ago left the parental roof to "Go West!" All this will make a busy year for railroads as well as for many other enterprises, and as people can't well circulate without circulating money as well, it is fair to presume that the "hard times" which have prevailed during the past two years will perceptibly ease. It is well that railroad managers should understand these facts and make ample preparations for the approaching "rush." Outside of Philadelphia we honestly believe very few people have an adequate conception of how great will be the occasion.

SIAM AT OUR CENTENNIAL.

Information has been received through United States Consul Partridge that the Kingdom of Siam will participate in the Centennial. John H. Chandler, an American citizen, has been appointed Commissioner to represent that country, and about $100,000 will be expended to display its products and Industries. Mr. Chandler was to leave Bangkok some time in December with goods for the Exposition. It was intended at first that a prince and several noblemen would be present at the Centennial. It has finally been decided that no nobles will accompany Mr. Chandler, into whose hands all the arrangements have been placed.

Spain and the Centennial.—A dispatch from Madrid, dated Jan. 5, says:—A royal decree has been issued emanating from a Commission charged with installing the exhibits from the Spanish colonies at the Philadelphia Exhibition. The Commission will draw up a memorandum relative to the exhibition. The Governors of Cuba, Porto Rico and the Philippine Islands will appoint members.

Italy and the Centennial.—A recent dispatch from Rome announces that the President of the Italian Executive Committee on the Philadelphia Exhibition will leave for America in April, to take the direction of the Italian section.

There will be a grand exhibition of the mineral resources of Canada at our Centennial.

A DUCK TENT HOUSE.

Sheep Husbandry.

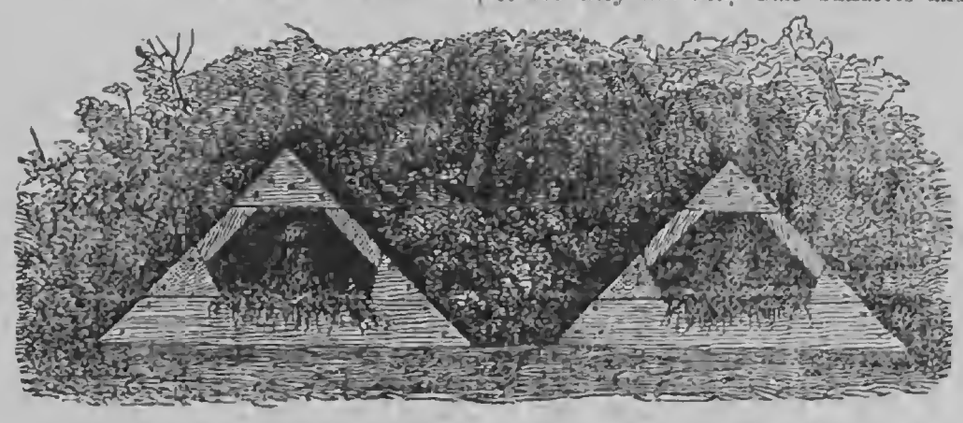
MANUFACTURING MEAT AND WOOL.

Instead of selling wheat, corn and hay from farms not in the vicinity of the best markets and where manure can be had at a very low price, if meat and wool was made for sale instead of robbing the soil year after year it would most assuredly pay very much better and improve the fertility of the land till this kind of farming would double the income, because the quantity of rich manure resulting from the consumption of corn and grain would increase the yield per acre, till there would be a corresponding augmentation in the quantity of meat and wool. Dairy produce, cheese and butter, if of the best quality, would also pay proportionally better than selling the food manufactured into milk.

Of course if it pays the English farmers to buy corn after the freight has been added to the price in the United States and make it into meat and wool, it must answer better to bring the crops into meat &c., while no expense has added to the price of the food. In sending meat to England it would be the same as in exporting cheese; the quality must be such as will suit the demand, for it must be ripe and of course equal to the best there, and when this trade is established and the country is awake to the importance of fattening cattle and sheep there will be bitter repentance for plowing up the fine natural pastures which follow on the cleared land in Kentucky and several other States. For although some newspapers with inexperienced writers tell their readers permanent grass land would not pay, yet the facts of hundreds of thousands of grass fed beeves stare them in the face as they arrive from the West and the buffaloes, deer, &c., which fatten on the old prairies prove what wretchedly poor weak minded men they must be who say it is best to sacrifice all the rich old sod to the remorseless plow. It is not twenty years since advocates for having the grass all in seed before it was mowed for hay were as plentiful as blackberries, and in Duchess County, New York, not more than ten years since I have argued with men who thought themselves smart who would not commence mowing till the grass was all dying.

A New Jersey farmer, whose name began with R. (I forget the name) was very severe on me for advising the cutting of green grass to make hay, intimating, I must be as green as the grass. Well! that man has lived to see his ideas superseded, but there are scores in every country upholding fallacies as great and editors of papers who support their correspondents, as for instance lately, an Englishman who must have come from some town and who never saw a grass field excepting as passing by on a Railway, said grass as a natural and permanent established sward was out of the question on this continent, to which the editors added, this writer being acquainted with England and the United States, knows all about the subject, therefore it is settled—natural grass will never pay, &c. Of course they will deny that buffaloes and deer ever get fat on permanent pastures or that in Kentucky or Texas, &c., cattle or sheep become beef and mutton.

A Working Farmer.



TURKEY HOUSE AND NEST.

SHEEP PAY BEST.

In "Some Sheep Talk," in the National Live Stock Journal, an experienced stock keeper says:

I have been feeding some three hundred head of cattle, and I am satisfied that, even with the most favorable conditions for selling when the time comes, I shall make a great deal more money, dollar for dollar, on the money I have invested in sheep, than I shall make on the capital invested in cattle. I have about six hundred sheep, running without any particular attention or care, and have sold one thousand four hundred dollars' worth of wool of this year's clip, and have two hundred and fifty lambs besides. I do not think it possible to have done so well on any equal amount of capital invested in cattle. One great advantage sheep have over other stock is, they never die of the contagious diseases which they contract. They get the scab or foot-rot, or something else, and if unchecked, it gets them in bad condition, and would ultimately, perhaps, kill them. But the very worst contagious diseases to which sheep are subject, give the owner ample time to treat the affected animals, and the diseases are generally of a character which yield readily to treatment.

The Poultry Yard.

TURKEY HOUSE AND NEST.

To save the trouble, says the Hand-Book of Poultry, of constantly watching turkeys while they are seeking their nests, there should be a yard inclosing an eighth of an acre for every fifteen birds, where nothing else is allowed to go. Eight feet long pickets, with a white birch or any other brushy bush woven in along the top, will make the most secure inclosure. As early as the first of April nests should be made in this yard.

The best arrangements for nests are small houses, about three feet by three, gable-shaped, (as shown by engraving,) and three feet high in the center. These should be scattered about the yard, and, if convenient, be partly hidden by an over-covering of brush or something made available. If two or three turkeys incline to one nest, set another house at right angles with that which contains the one they covet, and place several eggs in this new nest, and the probability is, that this will end the trouble; or let them all lay together till one begins to sit, and then shut her in, which will oblige the others to provide for themselves, elsewhere.

DUCK HOUSE.

A plan of a very cheap and pretty duck house is given in the American Poulterer's Companion, to be constructed after the style of the engraving herewith given. It should be placed on the bank of a pond or small island of an ornamental sheet of water. It may be constructed of rough boards thatched with straw, and partly covered with running vines and shrubbery, which would not only be ornamental but make a very pretty and cheap house for aquatic fowls. The interior arrangement of the house may vary according to the means and taste of the porprietor, only providing the ducks with nest boxes, in order that they may lay and incubate undisturbed, and affording proper protection for their young.

The Rural will will be glad to receive plans of improved poultry houses, etc.

The Vineyard.

A NEW WAY TO KILL PHYLLOXERA.

In one of our foreign exchanges we find the following on Phylloxera:—Among the thousand and one remedies proposed for the extirpation of the Phylloxera is one by MM. Balbiani and Borrot, and which has been brought under our notice by M. Sisley. The plan proposed is to remove the bark from the stocks of the vine during the winter when the winter eggs of the creature described by M. Balbiani, and which are deposited in and under the bark, may be destroyed by an insecticide, or by the application of boiling water. We are afraid that on the large scale these proposed remedies would be found impracticable.

The above, like many suggestions occasionally seen going the rounds of the press, show that the author had very slight knowledge of the insect he seeks to destroy or of its habits. The Phylloxera while in its root-inhabiting form attacks the minute fibers or rootlets, usually far away from the main stem above or below ground; it there becomes enclosed in a minute gall of cellular matter of a soft, spongy nature, not unlike the galls found upon the leaves of oaks and hickories in summer. This insect while inclosed in the gall is pretty safe from solutions which may be applied to the soil, and much more so from any application to the stems as proposed by Messrs. Balbiani and Boitot. It is quite likely that these gentlemen have found the eggs of some minute species of insect under the rough bark of grape vines and mistaken them for those of the Phylloxera.

Diary of a Ruralist.

DAILY RURAL LIFE.

From the Diary of a Gentleman near New York City.

AMONG THE GERANIUMS.

Dec. 29.—It may be rather early to commence making preparations for propagating bedding-out plants for next summer, still I can hardly resist the temptation of making a few cuttings occasionally when I find them in proper condition. In looking over my geraniums to-day I find they have made sufficient new growth to yield a goodly number of cuttings, and these have been taken off and put into positions which will probably insure the production of roots thereon. I have procured but few new sorts, being pretty well satisfied with the best of the old, or those fully tested. Besides, one cannot always determine the merits of a variety upon short acquaintance, and a year or two of experience may make us reverse first opinions.

For instance, when I first obtained *La Nigre* and tried to make it bloom in the house, I was very much disappointed, because the flowers would not open, most of them drying up and dropping off in a half-developed state. The flowers were very double and of a dark, rich, purplish, maroon color, quite distinct from any other variety of its class, hence very desirable at that time; but the bad habit of not opening freely more than counterbalanced these merits. But in the following spring a number of plants were set out in the garden, where they bloomed profusely during the entire summer, and the flowers opened as freely as other double sorts, consequently I put this variety down as an excellent bedding-out sort, but poor for house culture. *Deuil de Strasbourg* is another double variety which may be classed as first-rate in every respect, blooming freely in the house as well as when bedded out. The flowers are very double and of a clear, light, claret color, and of good size and form. Add to the above *Marie Lemoine*, a splendid double pink variety, and *L'Annee Terrible*, with its orange-scarlet flowers, and one gets the cream of the two dozen or more sorts offered by our florists. A good pure white, double variety is much needed, but those heretofore offered as such are the poorest kind of trash and not one of them worth cultivating.

Among the single flowering varieties there is scarcely any end of the really good ones, and the novice in these matters need have little fear of being disappointed in making selections from any late list of choice sorts. The list of ornamental-leaved sorts is also quite large, but outside of the ordinary bronze and silver-leaved sorts represented by Beauty of Canderdale, Mrs. Pollock and Mountain of Snow, there are a few unique and very desirable varieties. Among the best and most distinct I would name the following:

Distinction.—This is a remarkable novelty; the leaves are of medium size, of a dark, rich, green color, and nearly circular in form, the edges coarsely serrate, a narrow and almost black band extending the entire circumference, near the margin.

Happy Thought.—This is apparently a seedling of some common green-leaved sort, but instead of showing a zone or edge of a different color, as usual when variegation appears among geraniums, there is a large, yellowish-white blotch at the base of the leaf, this color frequently extending down the entire length of the leaf stalk or petiole. This variety exhibits one of those wonderful freaks of nature which prompts us to ask—What next?

Reticulatum.—Leaves round, with smooth edges, bright green color, but, as the name implies, finely netted or veined with yellow, the lines being about one-fortieth of an inch in diameter.

There are also other sorts deserving a place in this list of "curiosities," but the above will give an idea of what our florists are doing in this line.

THE SMILAX AS A WINDOW PLANT.

Dec. 30.—The *Myrsiphyllum asparagoides*, commonly known as Smilax, is one of the prettiest little climbing plants with which I am acquainted. There are no large and showy leaves or gaudy-colored flowers to attract attention, but everything about the plant, from its long, slender, grass-like stem to its small, delicate, fragrant, white flowers, are the very perfection of grace and neatness.

The roots, being small, require but little pot-room or soil, and the vines shoot up rapidly, clinging to any slight support given in the form of twine, wire or trellis. Plants are easily produced from seed, or they can be had very cheaply of almost any florist. I do not think the merits of this neat little climbing plant are as fully appreciated as they deserve by those who take delight in cultivating window plants, as it is especially adapted to this purpose. While a majority of plants of a similar habit become large, coarse and cumbersome when fully developed, the Smilax never reaches such a stage, but is always light and graceful, no matter how strong and vigorous the growth. It is extensively cultivated by our florists, the gentler sex being their principal customers, for Smilax enters largely into those "little nothings" which add so much to the grace and beauty of the final touches of a lady's toilet. Although the vine appears to be very delicate and fragile, it is quite the reverse, for the stems are almost as tough as iron wire, and the leaves remain fresh, without wilting, a long time after the twigs are separated from the parent plant, even in a warm and dry atmosphere, hence the special adaptability to the purpose named. New Year's Day being now at hand, I am reminded of the merits of Smilax by some hints from the women folk that my own plants would suffer demolition tomorrow.

WANTED—A JOURNAL OF FORESTRY.

I would like to see published in this country a journal exclusively devoted to Forestry. This is a field which as yet has scarcely been invaded by scientific or practical laborers, still the whole subject of forestry is one of vast importance to the country. It is not enough to know exactly how many species of oaks or maples we possess, or how to propagate them most expeditiously, but we need more specific information than has yet been given us in everything connected with this subject. We are told from time to time that forests have a wonderful effect upon climate, increasing or decreasing rain falls, but the arguments offered *pro* and *con* are founded mainly upon theories.

We stand in need of a more thorough knowledge of the geographical distribution of species, which could scarcely fail to reach practical results in pointing out the adaptation of certain kinds to certain climates and soils. We know as yet scarcely anything of the valuable properties of our native forest trees. It is true that our mechanics have had some experience in the use of the different kinds of timber in their various occupations, and so have the tanners, dyers and paper makers, but all the investigations made in these directions have been very superficial.

The geologist, chemist, botanist, ornithologist and entomologist all have, or should have, a special scientific interest in this subject, as well as the agriculturist and artisan. Our horticultural and agricultural journals devote more or less space to forest literature, but the treatment of the various branches of the subject must necessarily be restricted to very narrow limits under such circumstances, and hence the want of a periodical specially devoted to forestry in all its ramifications. Perhaps the time has not arrived for such a journal, but the need of it is none the less obvious.

Arboricultural.

PLANT MOVEMENTS.

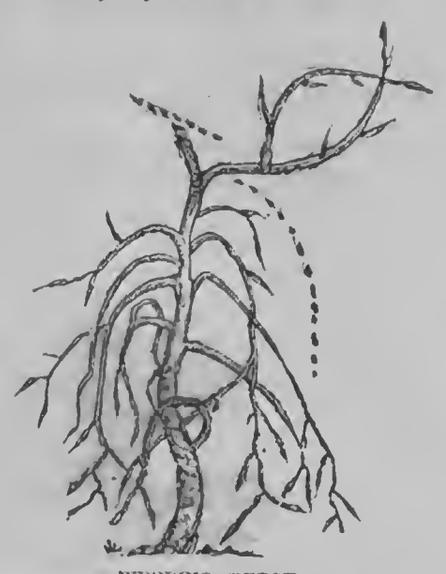
THREE years ago we purchased several Weeping Beeches. The leader of the one figured in the sketch died down to the point indicated by the short dotted line and was there cut off. It was not until the second summer that the tree made a thrifty growth. As, however, all the secondary branches were so pendulous as to droop in a direction almost parallel with the trunk, and as the trunk itself developed no buds, we at length grew curious as to how another leader was to be provided.

Late last spring (the third season) it was noticeable that the topmost branch was changing from its position, as indicated by the lower dotted line, toward a perpendicular. This elevation continued until the fall of the leaf, when it was found to have moved through an arc of at least 60 degrees, as represented in the cut.

It may seem to our readers that the relative size of the moving branch is exaggerted. It is, however, the largest of the branches, and as proportionate as we were capable of sketching it.

The Weeping Beech is a variety or sport of the English Beech, *Fagus silvatica*, and its pendulosity has been as decided as unvarying through we know not how many years. Counting its change from an upright to a pendulous tree as a variation that gravity might, in a degree render easier, if not explain, we have here an instance in which the heaviest branch, ignoring gravity, abandons its assumed habit to conduct the vertical growth of the tree, while every other bud and branch remain as pendulous as before. The buds upon the moving branch relatively to it have not altered their position—so that as they pointed downward while the branch was pendulous, they now point upward. It remains to be seen whether the lateral buds of this branch will reverse their direction of growth in harmony with the drooping habit of the tree, or whether with the terminal bud they will make an upright growth, reassuming the habit of the type.

There is not a plant, however, that does not in some form possess this power of movement or of adaptation. It rivets our attention only when we happen to observe it in some unusual and striking phase. Many vines grow erect until adjacent to a supporting object; then they twine about that object, conforming and clinging to its surface, of whatever shape, and again stretch up without a curve until another supporting object is reached. This is no less unaccountable; but we see it every day and mark it not. Branches



WEEPING BEECH.

have been artificially twisted so that the top of the leaves should look to the ground and the bottom to the sky. Such leaves very soon resume their normal positions; or, if prevented from doing so, soon wither and die. Some plants voluntarily close their leaves at night, as if to rest, opening them in the morning—as *Cassia nictitans* and other leguminous species. Others close them upon the slightest touch at any time, as the Sensitive Plant, *Mimosa pudica*, and many of the Sundews. Many well-known flowers open at a certain time daily, to close during the night, while others, too delicate to endure the sun's rays, bloom only at night. The spores of many Seaweeds, after leaving the parent cell, frisk about in the water for a long time, like so many microscopic animals.

The habit of the great Banyan Tree, *Ficus Indica*, is the same as that of any other until the branches stretch out so as to need additional support, when new branches or adventitious roots, as they are called, descend from the old branches, penetrate the ground and serve as props. The Screw Pine (*Pandanus*), Corn and many *Lycopods* present, in modified forms, like peculiarities.

The germination of seed, indeed, presents to us one of the most remarkable and beautiful illustrations of what, without a very violent leap, might be termed a plant's *instinct*. Minute as the particles of earth in which they grow, the tiny points of the seed never mistake the functions they were created to perform. Nourished by the nutriment in which they are enveloped, or by the cotyledons, in their first efforts of growth, the radical, parting from its sister plumule, creeps sturdily into the earth, where it finds its future humble occupation and its home. The plumule shoots up into the sunlight and air, where it finds a co-operative employment in returning, in the form of assimilable food, a part of the raw material which its humbler sister of the earth liberally supplies.

The trunk of a young tree may seem hard, clean and budless. Examined in its essential parts—the outer bark, liber and alburnum—we can detect by the aid of the microscope only those ordinary cells involved in the transit of the sap to and from its leafy top. Yet, if we cut this trunk in two a foot above the ground, that which remains, in its struggle for existence, at once changes its functions and structure. Many buds—those ubiquitous guardians of vegetable life—develop like mushrooms, and the leaves which quickly follow, as if they were good children gathering and preparing food for a hungry parent, continue with but a temporary check the vitality of the tree. If now we cover the old trunk and a part of the young shoots with earth, the buds which ere now were engaged in a struggle to protect their parent seize the opportunity of propagating themselves and multiplying the species, and each commences the formation of roots—an economy of which the nurseryman stands ready to avail himself in the collection of Paradise stocks for his dwarf apples and of Quince stocks for his dwarf pears.

The provident industry of the "Busy Bee" that "improves each shining hour" in gathering its winter store is no less exemplified in the "busy plant" that prepares during one summer the food by which it is enabled to develop leaves the next—or the flowers which, while they enliven the face of the earth with a beauty that "passeth all understanding," provide with a rare unselfishness for myriads of individuals that will bloom after they have passed away and added their fertilizing ashes to the soil which nourishes the new generation.

A vast array of instances in which plants are endowed with motion which they have the power to exert seemingly toward a definite object might easily be collected. Together we cannot view them as compatible with the conviction that the life of plants is purely mechanical, but that, though differing in degree, and, perhaps, in essence, they are possessed of vital propensities or tendencies as high in the scale of intelligence as is implied by that non-committal term, *instinct*, by which we disguise our ignorance of the mental operations of the lower animals.

E. S. CARMAN.

Insurance Department.

INSURANCE NOTES AND NEWS.

The Continental Life.—The Insurance Chronicle says: "The Continental Life Insurance Company of New York has employed agents at the South to buy up its outstanding policies. The policy holders who can be induced to sell are getting less than fifty per cent. of the reserve." This will not surprise those of our readers who remember the comments we had occasion to make, some months since, upon the practices of this same Continental Life Ins. Co., which made the attempt, doubtless successfully in many cases, to induce the holders of paid-up policies to exchange them for forfeitable term insurances. Those who have the effrontery to attempt this in New York City, where actuarial advice and opinions are readily obtained, can calculate with more certainty upon the stupidity of the people of less favored regions, and will no doubt obtain, upon their own terms, the release of a vast number of their policies. We shall not be startled by the announcement that their emissaries, emboldened by their successes at the South, have essayed the same kind of parasitic enterprise at the North, also. Should they succeed in inducing the people here to sell their policies for a song, through fears of the company's stability, diligently cultivated by the parties who profit by this species of industry, it will demonstrate that we have little grounds for claiming superior intelligence. The Continental is a solvent company, able to complete all its contracts, none of which should be surrendered by a policy holder unless the insured is in the best of health, and the full reserve in cash is paid. Those who do not know the value of their policies, but desire to sell them, can have them valued by applying to us.

A Tripartite Amalgamation.—In December, 1872, the National Capital Life Ins. Co. of Washington, D. C., abandoned business, and was, ostensibly at least, re-insured with the Penn. Mutual Life Ins. Co. of Philadelphia. About a year later the National Life Insurance Company of New York was closed up at the suit of a stock holder, put into the hands of a receiver, and subsequently re-insured by the American National of New Haven, Conn., a company that will be long remembered for its success in bottling up the Insurance Commissioner of that State, and gaining

> . . . . . "a victory that cost
> as much as if the day was lost."

Well, it is now announced that all these three companies are to be combined under the charter of the first named company, which, being granted by an act of Congress, is held to confer peculiar privileges not granted by those which derive all their authority from mere State legislation. Just how this is, or will be decided, or what the *deus ex machina* of this enterprise proposes to do in the premises, we cannot undertake, at this early date, to predict, except that if he thinks he has rights he will force a decision one way or another.

The Governor of California, who is Insurance Commissioner as well, makes a sort of annual report, which, whatever it lacks in other things, lacks nothing in the score of brevity. He merely chronicles the fact that the severe legislation of that State, in respect to life insurance companies, had the effect to compel seventeen out of twenty eight companies to leave that State, and that of the eleven that remains only four propose to do any new business. One of the laws enacted, "to protect the insured by compelling the financial soundness of the companies," requires of them to return to the holders of a lapsed policy three-fourths of the reserve; a defective remedy, but still better than no remedy at all for the evils of forfeiture.

One Place to Put It.—The papers tell of a man—of course out West—who purchased a can of kerosene and put it into the oven for safe keeping. He remembered all about it while the fire was roaring, the tea-kettle singing merrily, and the slapjacks burning nicely, and in time to get the family—himself included—safely behind the barn. He thinks he can use the stones for a new wall for the cellar, and one of his neighbors has brought him one of the best flat-irons. Perhaps it is just as well that it did not happen from blowing down the lamp chimney.

The Travelers Insurance Company, of Hartford, Conn., which issues two kinds of policies, life and accident, is one of the most successful institutions in America. In the past six months it has increased its surplus about $300,000.

Domestic Economy.

USE OF SALT IN PACKING MEATS.

The Massachusetts Ploughman publishes the following interesting and valuable facts about the uses of salt and the kinds of salt to use in packing meats. The meat-packer does not aim at a mere preservation of his beef and pork—his main object will always be to secure the keeping of his meat in the most palatable condition, and as much as possible of its natural color. Chloride of sodium, or what means here about the same, a good commercial salt, answers both ends satisfactorily, if properly applied. It does not necessarily change the color of the meat, nor does it affect its tenderness beyond reasonable limits. It is also a good antiseptic, for it prevents, if present in a sufficient quantity, the development of organisms of a lower order which in their growth, as a natural consequence, will hasten the disintegration of the meat mass, and thus its final putrefaction.

Practice recommends the use of the coarse and hard qualities of salt for meat packing, for the following reasons:—They dissolve gradually, and contract the meat by degrees to a desirable compactness; they keep the salt pickle within a certain moderate concentration; they cannot enter mechanically into the meat, and thus overcharge it, and may therefore be applied in a sufficient excess so as to compensate for the losses of pickle by leakage, etc., without endangering the tenderness and the flavor too prematurely.

The common fine salt answers for a short period of keeping very well, and is consequently used in the packing of meat for immediate family consumption. Fifty to fifty-six pounds of coarse salt are usually taken for the salting down of one barrel of meat; the bottom and top of the barrel are always carefully covered with a layer of coarse salt. The coarse qualities of salt which are used in our country are either manufactured from brines or from sea water. The purer the salt the nicer is the flavor of the meat. A salt which contains large quantities of foreign saline admixtures, particularly of chloride of calcium and of chloride of magnesium, imparts a pungent and disagreeable taste, and injures also the color of the meat.

NEW MODE OF WASHING.

The ill effects of soda on linen have given rise to a new method of washing, which has been extensively adopted in Germany, and introduced into Belgium. The operation consists in dissolving two pounds of soap in about three gallons of water as hot as the hand can bear, and adding to this one tablespoonful of turpentine and three of liquid ammonia; the mixture must then be well stirred, and the linen steeped in it for two or three hours, taking care to cover up the vessel containing them as nearly hermetically as possible. The clothes are afterward washed out and rinsed in the usual way. The soap and water may be reheated and used a second time, but in that case half a tablespoonful of turpentine and a tablespoonful of ammonia must be added. The process is said to cause a great economy of time, labor and fuel. The linen scarcely suffers at all, as there is little necessity for rubbing, and its cleanliness and color are perfect. The ammonia and turpentine, although their detersive action is great, have no injurious effect upon the linen; and while the former evaporates immediately, the smell of the latter is said to disappear entirely during the drying of the clothes.

SELECTED RECIPES.

Indian Rusk.—Two light cups of Indian meal, one cup of white flour, one teaspoonful of saleratus, enough sour or buttermilk to dissolve one cup sweet; stir in ¾ of a cup of molasses.

Poor Man's Cake.—One cup of sugar, one cup of milk, one tablespoonful of butter, one teaspoonful of dry cream of tartar, one-half a teaspoonful of soda dissolved in the milk, one egg, a little cinnamon, and flour to make it as stiff as pound cake.

Ginger Cake.—One and one-half pounds of flour, three-fourths of butter, one pint of molasses, five tablespoonfuls of ginger; rub the butter and sugar together; then roll them out very thin and cut them into rounds, place them on tin sheets and bake them well, and they will keep good a year.

Chocolate Cakes.—One pound of sugar, one pound of flour, one pound of butter, eight eggs, two tablespoonfuls of brandy, a pinch of salt, chocolate glazing. Mix the above ingredients well together with a wooden spoon, putting the butter (melted before the fire) in last. Spread a baking sheet with butter, put over it the mixture half an inch thick and bake it. Cut the cake into oblong pieces, and glaze them thickly with chocolate.

THE BLANCHARD CHURN.

The Dairy is one of the Rural New-Yorker's specialities. Probably no other journal in the country has done more than it to disseminate accurate knowledge on Butter and Cheese making.

The Blanchard Churn.

Not all our readers are personally interested in the methods of making Factory Cheese, but no farmer who keeps even a single cow is without a churn, and no farmer will fail to get one of improved pattern. After examining various kinds we have decided to offer the Blanchard Churn in the Rural New-Yorker Premium List, as in some districts it may be the article which our Agent-Friends would most desire, and believing that we can do the Dairy interest no greater favor than by bringing it within the reach of every one who wishes it. The Blanchard Churn is a favorite among Dairymen, has taken numerous first premiums at Fairs, and those who secure one as a Premium will never regret their choice. One of these churns, costing $8, will be sent to any one sending 5 subscribers at $2.65, or 12 subscribers at $2.15—our lowest club rates.

Scientific and Useful.

MOISTURE FOR PLANTS AT REST.

It has generally been supposed that plants do not need any moisture during their periods of rest, as, for example, trees in winter, and bulbs after their short season of activity. An English writer, Mr. J. Gnoom, contracts this idea in the London Garden, and we copy a portion of his very suggestive article.

There appears to be an idea that plants of a deciduous or bulbous character do not require moisture after they have shed their foliage, but that is, I think, a mistake, for that serious injury often results from keeping such plants, when at rest, dry, there can be little doubt. The effects of drouth are not, however, so immediately observable, as, when the foliage proclaims, by drooping, the lack of moisture at the root. In considering the effects of what is termed "drying off" on various subjects, I would divide them into two classes, viz., those with bulbous or fleshy roots, and those with fibrous ones. The latter are the first to suffer, owing to the fact that they have no store-house, so to speak, on which to fall back to maintain their vitality until a supply of moisture enables the roots to come to their aid. The effect of drouth on Peaches, Vines, and such fruits as are cultivated under glass, either in inside borders or in pots, is that the buds usually either drop off or refuse to swell, a circumstance almost unknown in the case of the same subjects when fully exposed to the annual rainfall.

I think that in the case of many deciduous trees and shrubs the roots are active for some time after the fall of the leaf—if indeed, they are ever wholly at rest; therefore, I would advise all who value the health of their trees to see that they do not suffer from lack of moisture. In temperate regions, the season of rest for this class of tree is invariably accompanied by abundant moisture, both at the root and in the atmosphere; therefore, I conclude that much more injury is likely to result from lack than from excess of moisture. Many bright hopes of success in fruit culture are blighted at this season, although the cause is not always apparent. With bulbous and fleshy-rooted plants, their peculiar formation enables them to resist the effects of drought for a lengthened period without entirely losing their vitality; but, nevertheless, the energy of the plant is, I think there can be no doubt, greatly lessened. If we compare the growth of our ordinary spring-flowering bulbs, that are, after blooming, lifted and stored on dry shelves with those left undisturbed in the soil, we shall not require further proof as to which system is best. The many beautiful Lilies now in cultivation are very impatient of the "drying off" process; while the beautiful Belladonna Lily can only be had in perfection if left undisturbed for years. If, then, any class of plants is benefited by being kept thoroughly dry when at rest, it must be such bulbous-rooted plants from the hottest regions as are usually grown in stove temperatures, such as Caladiums, Gesneras, &c.; yet it is conclusively proved that more are lost by "dry rot" than by excessive moisture. Cyclamens used at one time to be dried off periodically; but, thanks to a better knowledge of their culture, they are not now subjected to such a trying and weakening ordeal. The consequence is that finer plants are now raised the second year from seed than we used to have after several years' growth.

We can add, from personal observation, that injury to garden trees from excessive cold is more frequent during our American winters, when the ground is excessively dry, than when it is moist. This may indicate that the roots of trees absorb some moisture, though only slowly during winter, and thus supply the loss by evaporation from the trunk and branches; or it may be only a result of the ice in the soil, forming a covering and protection to tree roots from the severity of cold. Ice never becomes colder than 32 deg. F., while cold atmosphere may sink far below zero. A thickness of ice on the surface of the ground may protect the roots from injury just as Esquimaux and other far northern races are kept warm in winter in huts of snow. Beneath the frozen surface there is probably also some action, though very slight, of the roots, even in winter. There must be some evaporation from the bodies, branches and twigs of trees, even in winter, and, unless this loss of moisture is somewhat supplied, trees would dry and wither. With evergreens, evaporation of moisture during winter must be very considerable, and require a large amount of moisture to prevent injury.

The experience of the last two or three cold and dry winters has given us some valuable hints on this subject. Hardy evergreens have generally suffered more than deciduous trees, possibly because evergreens evaporated more moisture. Injury was also greatest on elevated pieces of ground. This has been explained because such places were more exposed to severe winds. Is it not rather because these "high" localities have also been exceedingly dry. In no case have we seen trees, usually considered hardy, killed or seriously injured when there was not good reason for believing that the ground was frozen down to the extremities of the roots, giving no chance for absorbing moisture. Dry soils freeze much more deeply than wet, for reasons previously given. The cold of 1873–4 & 5 was not more intense than in many other years, but it was long continued, and, in many portions of the country, accompanied by severe drouth. It is, very possibly, this winter drouth which did much of the mischief that has been credited to the cold weather. A few bucketfulls of water thrown around hardy trees, early enough in the fall to allow it to penetrate to the subsoil, might have saved some specimens which succumbed. This winter there is nowhere any lack of moisture, and hence, whatever severity of weather we may experience, we do not look for any damage to trees accounted hardy.

UTILIZATION OF COBWEBS.

Cobwebs have been applied to various uses. The delicate cross-hairs in the telescopes of surveying instruments are fine webs taken from spiders, a species that are specially selected for their production of an excellent quality of this material. The spider, when caught, is made to spin his thread by tossing him from hand to hand, in case he is indisposed to furnish the article. The end is attached to a piece of wire, which is doubled into two parallel lengths, the distance apart exceeding a little the diameter of the instrument. As the spider hangs and descends from this, the web is wound upon it by turning the wire around. The coils are then gummed to the wire and kept for use as required. About a century ago, Bon of Languedoc succeeded in making a pair of gloves and a pair of stockings from the thread of the spider. They were very strong and a beautiful gray color. Other attempts of the same kind have been made; but Reaumur, who was appointed by the Royal Academy to report on the subject, stated that the web of the spider was not equal to that of the silkworm, either in strength or luster. The cocoons of the latter weigh from three to four grains, so that 2,304 worms produce a pound of silk; but the bags of the spider, when cleaned, do not weigh above the third part of a grain, so that a single silkworm can accomplish the work of twelve spiders.—*American Cyclopædia.*

When you think of buying a harness examine the leather of the hame strap and the near tuck of the throat latch, and likewise of the crupper. If these ends are of a shazy stuff, calculated to squash and plague you while trying to make them enter their loops, don't buy. The man who cut the harness did not have the interest of the purchaser in his mind. At three separate and distinct scowls for each buckling the harness would be dear as a gift. And most likely faults and oversights run through the entire rig.

Hygienic Information.

LIFE LENGTHENED.

Dr. Hall, in his excellent Journal of Health, gives the following sensible and suggestive rules under the above heading:

1. Cultivate an equable temper; many have fallen dead in a fit of passion.

2. Eat regularly, not over thrice a day, and nothing between meals.

3. Go to bed at regular hours. Get up as soon as you wake of yourself, and do not sleep in the day-time—at least, not longer than ten minutes before noon.

4. Work always by the day, and not by the job.

5. Stop working before you are very much tired—before you are "fagged out."

6. Cultivate a generous and accommodating temper.

7. Never cross a bridge before you come to it; this will save you half the troubles of life.

8. Never eat when you are not hungry, nor drink when you are not thirsty.

9. Let your appetite always come uninvited.

10. Cool off in a place greatly warmer than the one in which you have been exercising. This simple rule would prevent incalculable sickness and save millions of lives every year.

11. Never resist a call of nature for a single moment.

12. Never allow yourself to be chilled through and through; it is this which destroys so many every year, in a few days' sickness, from pneumonia—called by some lung fever—or inflammation of the lungs.

13. Whoever drinks no liquids at meals will add years of pleasurable existence to his life. Of cold or warm drinks the former are the most pernicious. Drinking at meals induces persons to eat more than they otherwise would, as any one can verify by experiment; and it is excess in eating which devastates the land with sickness, suffering and death.

14. After fifty years of age, if not a day laborer, and sedentary persons at forty, should eat but twice a day—in the morning and about four in the afternoon; for every organ without adequate rest will "give out" prematurely.

15. Begin early to live under the benign influence of the Christian religion, for it "has the promise of the life that now is and of that which is to come."

AN EXCELLENT IRRITATING PLASTER.

I have tried this plaster and know it to be good, besides it is very highly recommended to me by a friend in whom I have great confidence. She considers it really a necessity in her family. Take of Mandrake Root, Blood Root, Indian Turnip and Pike Root, finely pulverized, of each a half pound. Sift it through a fine sieve, cover with alcohol and let it stand until nearly dry. Melt four pounds of strained Burgundy Pitch, add a half pound of pure Venice Turpentine, then stir in the powdered roots. Incorporate the whole together; simmer until formed into a soft plaster. Care is necessary in the preparation of this plaster, so that the powders are not burnt in the hot tar and turpentine. It should be prepared on coals in an earthern vessel.

This plaster is designed to be applied over the parts in cases of deep-seated chronic affections, such as diseases of the liver, lungs, heart, stomach, kidneys, spine and sciatic nerve. Spread on a piece of leather and apply very warm. It produces a severe itching, and in the course of a day or two brings out small pustules, which discharge matter. When very sore, should be dressed with slippery elm poultice. When healed, apply the plaster again, if necessary. The head may be relieved by wearing this plaster on the spine or neck. It is also beneficial in throat difficulties. This quantity would supply eight or ten families. Julia M. W.

THE GRAPE CURE.

The London Garden speaks of the Grape Cure as follows:

"There are on the Continent numerous establishments devoted to the application of this remedy—two in France, three or more in Switzerland, and many in Germany, Austria and Hungary. The cure is very simple. It consists in eating an immense quantity of grapes. The patient takes but little ordinary food, and is required to eat three or four pounds of the fruit a day at first, the quantity being gradually increased to eight, ten or even twelve pounds of grapes. This is, if possible, to be eaten in the open air, in the vineyard whence the supply is derived—an arrangement which, no doubt, greatly conduces to the efficiency of the cure."

The cure is very simple, certainly, and, we should judge, very captivating; it is not remarkable, therefore, that it should be very popular.

IMPROVED HIGHWAYS DEMANDED.

THE following Petition to our State Legislature will, we earnestly hope, secure a long-needed reform. It is a matter in which most of our readers in this State are directly interested, and they should, by petition and otherwise, aid in influencing our legislators to take early and proper action upon a subject of such vital importance to themselves and the community generally. We understand the subject will be introduced at the annual meeting of the State Grange (held this week at Auburn), and presume the members thereof, who represent a large number of our best farmers and rural districts, will give it merited attention and encouragement:

OUR HIGHWAYS.

To the Legislature of the State of New York.

IT has become the settled conviction of all reflecting minds, that the present laws regulating highway labor are wholly inadequate to the wants of the traveling public; and that, under their administration, a vast amount of labor and expense are annually incurred, without any corresponding benefit to the public. It may safely be said, that there is no subject of paramount public importance so needful of reform. It is evident that the present system of highway labor is radically defective, for the reason that, from time immemorial, its administration has not, and we believe cannot, produce a good road. It is abundantly demonstrated by the experience of the past, that the annual expenditure of highway labor simply by plowing and throwing common soil upon the beaten track, obstructs rather than facilitates travel.

The rapid multiplication of occupants of land—the great increase of business generally, and the increased demand of an increasing population for favorable locomotion upon the highways—demand, at your hands, a careful examination of the subject; if wrong—a speedy repeal of the existing laws, and a proper remedy. We, who reside in this section of the State, are of opinion that it is high time for legislative action, for the following reasons, which we regard as unanswerable:

First—The piling of common soil upon the beaten track of a road is an obstruction to travel, and should be so regarded.

Second—It is a well-known fact, as each inhabitant of a road district is assessed a certain number of days, proportioned to the value of his land, and is under the direction of an overseer who appropriates the work where and as he pleases, the only incentive presented is to dispose of the work as readily as possible, without reference to *utility* or *permanance*.

Third—It is made by law everybody's, and that is *nobody's business*. It is a well-known fact, that a great proportion of the work assessed as highway labor remains annually unperformed.

For these and other reasons, to be given hereafter, we call upon the farmers and business men throughout the State, and especially upon every Grange, to let their voices be heard by the present Legislature. Gov. TILDEN'S Administration is one of reform. This great abuse of bad roads has slept for an age, unheeded and unnoticed, except by the loud curses and execrations of the wayfarer. Roads adopted at an early day, when the State was comparatively a wilderness, and when a better system was impracticable, will not answer now. It is high time to insist on *Centennial Roads*, adapted to the business and the growing wants of an increased and increasing population. We ask no subsidies from the State, and we have no money to buy the votes of legislators. We demand what may be reasonable and just.

LIVINGSTON AND STEUBEN.

Dansville, N. Y., Jan. 1, 1876.

RURAL NOTES FROM NORTH CAROLINA.

UNIVERSITY OF N. C., Chapel Hill, Jan. 1, '76.

DEAR MR. MOORE:—Several years have passed since I last wrote an article for the RURAL. Among the many changes of these years may be noted the failure of a large number of journals representing different departments of interest and enterprise. I congratulate you heartily that the RURAL has not only survived, but hangs out its banner for '76 with the confidence of a conquering hero. "Long may it wave!"

Changes, both pleasant and unpleasant, have come upon the industrial interests of the Old North State. Among the latter the most prominent, perhaps, have visited the Eastern section of the State, particularly the cotton-growing districts. The planters generally restricted their attention to the one staple, almost entirely neglecting other crops. Many mortgaged crops and lands to obtain supplies and suffered disastrously in the close of the year from the low prices and the necessity of early sales. In numerous instances money was borrowed at ruinous rates of interest. The tobacco planters are generally wiser. They raise breadstuffs and some stock. But even they have neglected progress in other things too much in their devotion to their staple product. There is some improvement in stock in the State. A great deal more of grass and clover seed are sown. As a consequence there are better milk and butter in many places, and a limited supply of fine beef, now and then in the markets.

The corn crop of the past year was unusually large. In consequence there are many encouragaing reports from the recent slaughtering of hogs. Heavy weights are published in different parts of the State. This is also attributable in part to the introduction of better breeds. Successful wheat growing is exceptional. The average yield is very low. The central part of the State does not appear to be so well adapted to Bisecreal as it was formerly. Of oats it is difficult to judge, as the rule is to sow them, without much care, on the thinner fields. Truck farming and dairy farming have both increased encouragingly with the growth of the towns and the forced development of new enterprises. Fruit growing is receiving more attention. Far more attention is given to grapes, to which this climate is so well adapted. Bee keeping is becoming more popular. Our mountain honey is exceedingly fine. The Italian bees and patent hives are working admirably in some places.

As to labor, I would report few material changes, it being worse in some sections and better in others. At present the people here are struggling under the general depression. There is great scarcity of money. This is charged both to the prevailing scarcity in the country and to the State Usury Law, which has caused the banks, to a considerable extent, to quit discounting in the State. Building and Loan Associations have abounded and doubtless led to a great deal of building.

Among the most pleasant changes I may justly class the resuscitation of the suspended University of the State at this place. Connected with it is the Agricultural and Mechanical College, contemplated by the Congressional grant of public lands. These and the academic course are all embraced in the institution. Thus far the Agricultural Department has not been developed to any great extent for the want of sufficient funds. Under former management, or mismanagement, the whole land scrip was invested and lost, and the poor old State was required either to refund to the Government or replace the amount (so it is stated). She decided to pay the interest annually. It is hoped that this great interest will contribute largely to the diffusion of much-needed intelligence in these vital departments of the public welfare.

Many other things might be mentioned, but the RURAL wisely prefers short articles. Perchance I will give you some more minute articles at other times. Truly yours, N. C.

CHEAP TRANSPORTATION FROM THE WEST.

THIS subject, which has heretofore been duly discussed in the RURAL NEW-YORKER, derives additional interest from the action of the Transportation Convention recently held in Chicago. Not only the West, but the whole country is interested in this subject, and the views of the large body of intelligent representatives from all sections are worthy of general attention. The following resolutions, offered by Ex-Gov. BROSS of Illinois, and supported by him, as also by the Hon. JOHN YOUNG of Montreal, show what is being done in the way of opening the Northern water route of transportation to the East:

Resolved, That in view of the enlargement of the Welland Canal, now in progress, and of the present and prospective diversion of the carrying trade of the Northwest to the St. Lawrence route, the construction of a slip-canal from the St. Lawrence to Lake Champlain, for which a favorable charter has been granted by the Dominion Government, and of the enlargement of the Champlain Canal, by which vessels of 1,000 tons can reach Lake Champlain and New York, or Montreal or Quebec, in from six to eight days less time than by existing routes, and at much less expense and depreciation of value in transport, is of vital importance to New York and New England, and to the entire country.

Resolved, That this Convention concur in the opinion expressed in the report of the United States Senate Committee on Transportation to the Thirty-ninth Congress, that the enlargement of the New York canals, the construction of the Caughnawaga Canal (from the St. Lawrence to Lake Champlain), and the free use of the Canadian canals, will greatly cheapen transportation from the West to the East, and that we are in favor of the appointment of a joint commission on the part of the United States Government and that of the Dominion of Canada, to arrange and recommend terms for the mutual free use of the canals and the inland waters of the two countries by the citizens thereof.

This water route is subject to some disadvantages, chief among which is the fact that it is closed half the year. Ultimately the greater portion of Western produce will be sent eastward on lines of railroad built exclusively for freight, with continuous trains, running at a moderate and uniform speed east and west on separate tracks. This plan, proposed in the RURAL NEW-YORKER six years ago, offers the simple and only effectual remedy for the Western producer. Its partial realization has already given great relief, and as business increases with the growing wealth and productions of the Western States, its advantages will be more appreciated than possible during the check to business which the country has felt during the past few years.

RURAL NOTES AND QUERIES.

A Good "Wager" Won—"Mintwood" Married.—Thousands of our readers will be interested in the announcement that the RURAL'S long-time versatile and talented contributor, Miss MARY A. E. WAGER (perhaps better known to the public as "Mintwood," as that was her most frequent signature,) was married at 23 Washington Place, this city, one very bright day last week (say Tuesday, Jan. 4,) by Friends' Ceremony, to WILLIAM RICHTER FISHER, Professor of Modern Languages in Dickinson College. The occasion was a very pleasant one to all participants, and the happy couple were wished *bon voyage* on leaving, soon after the ceremony, for Philadelphia. We are confident that hosts of Ruralists will unite with us in wishing Miss WAGER a happy and prosperous future with the able gentleman to whom she has been most worthily united. And many who admired and were benefited by her "Modes and Manners" and other contributions will be pleased to learn that Miss WAGER—beg pardon, Mrs. FISHER—has kindly consented to continue her contributions to the RURAL, for awhile at least, and we hope the time will be indefinite.

For the information of her correspondents among RURAL readers, we may add that Mrs. FISHER'S address will be Box 63, Carlisle, Pa., until June, and her permanent address thereafter, *Bryn Mawr*, near Philadelphia, Pa.

A Railroad to the Black Hills Gold Region.—Two Nebraska Counties have voted liberal sums in aid of this object. It should seem that enough hardship had been suffered from County aid to railroads; but if the people of Nebraska want the experience of Iowa, Wisconsin and other Western States over again, we suppose it is nobody's business but their own. A railroad to the Black Hills strikes us as a peculiarly speculative and unwise investment—more so, by far, than a road designed mainly for the transportation of Nebraska products to market. Better let the Black Hills go without a railroad until we know what is there beside blood-thirsty Indians.

The Western N. Y. Horticultural Society—Held its 21st Annual Meeting in Rochester, last week, with very successful results. The attendance is reported larger than ever before, while the discussions and reports and papers on practical and scientific subjects, are regarded as the ablest and most profitable yet said and read at any session of the Society. We are glad to note this, as the Society is doing much to promote the interests of the farmers and fruit growers of Western New York, and indeed of the whole country. As one of the RURAL'S Staff was present, a synopsis at least of the proceedings will be given in its pages.

Successful Co-operation.—A factory in Springfield, Vt., is owned by the persons who work in it. They started one year ago with five members and now have forty-five. All live in one large house, but families are separate. Men are required to save one-fourth of their wages and women one-sixth, which savings are invested in capital stock that can be sold at par at any time to the Society by giving six months' notice. A board of directors fixes the wages of each member, but any one can withdraw at any time, and receive pay for all he or she has invested.

Improved Stock Sacrificed.—WM. MATTOON of Springfield, Mass., was an extensive breeder of Devon cattle, but he got into financial trouble and the cattle were sold by the sheriff at astonishingly low prices. Thousands of dollars were sacrificed and the loss is discouraging to breeders of this stock. The famous bull, "Duke of Hampden," for which Mr. M. has refused $1,000, brought only $55, or about what ordinary stock would have fetched. By the way, isn't this about as good a time as any to get superior stock of some unfashionable breeds! Fashions will change some day, and then farmers who have other stock than Short-Horns may find their account in it.

The N. J. State Horticultural Society is to hold its first Annual Meeting at New Brunswick, (in Geological Hall, Rutgers College,) Jan. 20-21. All persons interested in any branch of Horticulture are invited to attend and participate in the proceedings. Samples of fruits in season are solicited. Mr. President THURBER will deliver his address at 2 P. M. of the first day, and be followed by papers and discussions on various subjects. Among the speakers announced are A. S. FULLER, P. HENDERSON, WM. PARRY, C. W. IDELL and other prominent horticulturists.

The Wet Weather in England continues. The rainfall, during the past three months, has been the heaviest on record. The result has been serious flooding in all low-lying districts. Where the drainage was good, as in most large towns, the public health has not been affected, but in poor districts, where the water has remained in the basements of houses for days and weeks, much sickness has been experienced, and the Registrar General's returns, at the close of this quarter, are looked forward to with the greatest anxiety.

Western N. Y. Farmers' Club.—This flourishing and useful Club met Jan. 5th, but held only a business session for the election of officers. HENRY QUINBY was elected President for the ensuing six months, and P. C. REYNOLDS of Rochester, Secretary and Treasurer for the year. The Club accepted an invitation to attend the meeting of the Western N. Y. Horticultural Society.

RURAL BREVITIES.

KANSAS papers urge silk growing in that State.

BUCKS Co., Penn., has a cow weighing 1,450 lbs.

FOUR persons, in one family in Mich., recently died from eating trichina in pork.

SHORT-HORN breeders in Iowa hold a Convention at West Liberty, Jan. 15th.

A GREENE Co., Ill., farmer has a hog which weighs one thousand pounds.

A CHINESE planter, near Signapore, India, has ordered plows and seed corn from America.

TWELVE thousand hogs died of cholera in Morgan Co., Ill., last year, and the disease is still prevalent.

THE Wisconsin State Horticultural Society will hold its annual meeting at Madison, on the 1st, 2d, and 3d of Febuary next.

A. B. WINANS of Convis, near Battle Brook, Mich., has husked from eleven acres of corn 1,185 bushels, all but 100 bushels of which was sound.

THE New England Homestead comes to us in a new dress and improved typographical appearance. Glad to note this evidence of its prosperity.

THE sugar crop of La. for the past year is estimated at 190,000 hogsheads. This is the largest crop in thirteen years, and about half the average yield before the war.

A NEVADA sheep man, who had tried and succeeded with sheep, said: "Sheep are better than a government bond; you can tear off a coupon every six months half as big as the bond, and the bond is left as big as it was."

THE New York Horticultural Society, which was organized recently, held its first meeting at the Cooper Institute on Wednesday week. The display of flowers that were new, or of other special interest, was large, which is regarded as a good augury.

WITH a little effort each reader of the RURAL can secure one new subscriber. Many can and are doing much better, but this paragraph is a reminder for those who have thus far done nothing. Show the paper to your neighbor and send his subscription.

THE annual Vegetable and Flower Seed Catalogue of GREGORY, the popular seedsman of Marblehead, Mass., is advertised elsewhere. We can indorse Mr. GREGORY as both honest and reliable. The fact that he grows so large a number of the varieties of seed he sells will be appreciated by all who want to have their seed both fresh and true.

THE HIGGANUM MF'G Co. of Higganum, Conn., have enrolled themselves among those manufacturers who publish an illustrated descriptive catalogue of their wares, gotten up in excellent style. Almost every implement which can be of use to a farmer is fully described and illustrated, as are many things which he could hardly find use for. Send for one of these and see if it will not save many dollars in the course of the year.

OLIVER DITSON & Co. have just purchased, for nearly $100,000, cash, the entire stock, music, plates and good will of LEE & WALKER, the old established music publishers of Philadelphia. For forty years the music firm of Oliver Ditson & Co. has been in existence. It has now four branches in the leading cities, namely: Oliver Ditson & Co., Boston; C. H. Ditson & Co., New York; Lyon & Healy, Chicago; and the new firm of J. E. Ditson & Co., Philadelphia.

WITH the New Year comes the announcement that E. N. FRESHMAN, our genial Cincinnati friend, has taken unto himself a partner, and will now be known, commercially, as E. N. FRESHMAN & BROS. If the energy and business that have heretofore distinguished their Advertising Agency, is to be increased in proportion to the number of the firm, we really can see no limit to the extent of their transactions. Let advertisers, then, beware, as Mr. S. D. FRESHMAN, the new partner, has a "tongue that can wheedle with the deil."

BUSINESS NOTICES.

BRIDE & CO,

769 Broadway, N. Y., want agents for the best money-making article in the world. Send for particulars.

For an Irritated Throat, Cough or Cold, "*Brown's Bronchial Troches*" are offered with the fullest confidence in their efficacy. They maintain the good reputation they have justly acquired.

SUN AND RAIN.

A young wife stood at the lattice-pane,
In a study sad and brown,
Watching the dreary, ceaseless rain,
Steadily pouring down—
Drip, drip, drip,
It kept on its tireless play;
And the poor little woman sighed, "Ah, me!
What a wretched, weary day!"

An eager hand at the door,
A step as of one in haste,
A kiss upon her lips once more,
An arm around her waist—
Throb, throb, throb,
Went the little heart, grateful and gay,
As she thought with a smile, "Well, after all,
It isn't so dull a day."

Forgot was the plashing rain,
And the lowering skies above,
For the somber room was lighted again
By the blessed sun of love—
Love, love, love,
Ran the little wife's murmured lay;
"Without, it may threaten and frown, if it will;
Within, what a glorious day!"

The Story-Teller.

OUR EASY CHAIR.

A CHAPTER ON KINGS AND QUEENS.

BY OLD KING COLE.

OUR HOME ON THE HILLSIDE,
Wellsville, Allegany Co., N. Y., Jan. 1, 1876.

THE sun is just rising in the east and the clouds, red with the morning light, coupled with the balmy south wind, blowing in gentle breezes, speaks of summer, and yet the almanac tells us it is midwinter. We have been reading the almanac—a book in which we learned our first letters and wherein, a half century ago, looked with wondering eyes on that ghostly picture of

TIME IN THE PRIMER,

and on that too, of the other specter-looking object like unto a man, and they called his name

ZODIAC.

We think that was it—with spears, and darts, and sharp sticks pointing at him and, in scanning the pictures, wondered whether Old Time had a demijohn or cornucopia or an unicorn in his hand: but now we know it was

AN HOUR GLASS,

from which the sands, since running, have dropped noiselessly away and now, behold, another glass, the mirror, in which we so looked as a child and wondered if we would ever grow big, tells the story. The sands are still dropping out from Times's hour glass and the King grows old.

A half century ago, and we were sitting on the knee of an old soldier. His locks were white as wool, and on his cheek was a scar made by the saber of a red coat, and many were the stories the old man told us about the Revolution, for he was a Revolutionary soldier and drew a pension, so they said; but we did not know what was a pensioner nor much of the Revolutionary war then still fresh in the memory of thousands surviving; for we were but a child and, as we listened to the stories of the old soldier, our eyes opened wide with wonder as he talked about battles and swords, muskets and cannon, and showed us his old coat, that he wore in the army and told us about the horse he rode and said he was a trooper; and that was a something we could better understand, for we had seen worlds of troopers on general muster day. And when he grew weary of telling stories, the old soldier would sing us a song, the first we ever heard sung, and thus did the ditty run:

"Old King Cole was a merry old soul,
A merry old soul was he;
And he called for his pipe and called for his bowl,
And called for his fiddlers three."

And as we listened to the old man's stories all about King George and his sitting on a throne and having courtiers around him and his wearing of a crown made of gold and diamonds, we wondered if

OLD KING COLE

was much like King George and, whether so or no, longed to be a king; a something we have become! and here we are, sitting on our old throne, the massive Easy Chair presented to us by Brother French, an excellent Methodist man—not of the Bishop Haven kind, since Brother French was and is a Liberal and voted for Greeley—and that is the reason, we presume, he gave us this

IMMENSE EASY CHAIR.

As we said, we have been reading the almanac and looking over the chronology, tracing back to the time when, fifty years before we sat on the knee of the old soldier; one of the many myrmidons of King George, Dunmore by name, better known as the British Nero, set fire to the city of Norfolk. It was just an hundred years ago this blessed morning when the flames so lit up the heavens in lurid glare and, as the sun rose out of the waters, looked upon the scene of conflagration while the wretched people stood amazed witnesses of the destruction of their homes and the breaking in pieces of their household goods; and within a few brief hours, what had been one of the chief cities of the new world became a blackened, ruined waste. Not many were the cities of America then. Boston and Philadelphia were both in advance of New York; and as for those little towns out toward sunset of to-day—Chicago, St. Louis, Cincinnati, San Francisco, and such like—they had not so much as existence in the fancies of fairies, to say nothing of the dreams of men. But Boston, the scene of that first great

AMERICAN TEA PARTY,

was a proud and rich town even then, for it was the home of John Adams and possessed Bunker Hill, and was only a little way off from Lexington. It had its kings, too—not titled and tinseled and crowned like to those of the old world, but of the order of Cromwell and Algernon Sidney—descendants of the old Roundheads; and queens too, had Boston—fairy queens of native beauty and bloom who, while their lords went forth in helmet and buckler to the wars, staid at home and did wifely duty, as becometh the true woman always, nor forgets the lint and bandages for the boys in the field, but bore them ever in mind, just as did our queenly mothers, sisters, wives and daughters who, a little while back, looked sorrowing and sadly on the bloody scenes of fratricidal strife, now happily ended; and who, binding up the wounds a little while ago, now unite in strewing flowers on the graves of those who sleep, forgetting whether this or that bore aloft the star-spangled banner or the bonny blue flag; or marched to the tune of "Dixie" or "Yankee Doodle," or wore, as he went down to death on the battle field,

THE BLUE OR THE GRAY.

Boston was under siege (possessed rather) by the janizaries of the King who, giving command from across the seas, bade his minions do well the work nor spare the rebels. While red-coated Britons paced the streets, keeping guard however, and making barracks of the houses of the descendants of the Roundheads, proud kings and queens, the first citizens of Boston, a little way off stood our Republican King George, surnamed Washington, the great American jailor, effectually, with his brave band around him, making prisoners of the enemy within the city. It was just

AN HUNDRED YEARS AGO

to-day that, amid the snows of winter, Washington and his little army so sat there, and eating their hard tack by day and lying down in their tents at night, gave to Britons their first lessons of American pluck, perseverance and endurance. And there were giants in those days. God's kings, dwelling among men, as in ages before, and none greater than George, who led the armies through the wilderness of those days. Thomas, who wrote the declaration.

JOHN HANCOCK

who with boldest hand signed it, saying, "There! Johnny Bull can read that without spectacles"—or words to that effect. Not to mention Doctor Ben Franklin, who sent up his kite after the lightnings, printed the first American newspaper, brought to us Lafayette and his gallant French compatriots who so helped us to whip the British lion—to say nothing of thousands of others, mighty kings and brave, each in his day and generation, living lives of valor and shuffling off this mortal coil, going away to

ANOTHER COUNTRY,

waiting each in turn the calling of the long roll. Nor have the names of the brave all been yet recorded, since many were but common soldiers, privates in the ranks, all equally kings in their day, and all had crowns too of a kind, but many more of thorns than of roses; so has it ever been and so shall it ever be till

TIME SHALL BE NO LONGER.

And who shall write the stories of the kings and chronicle their deeds of glory? Echo answers, Who?

AN HUNDRED YEARS AGO,

and skirting the Atlantic from the rocky coast of New England to the coral reefs of Florida, were seen cities and towns with their few hundreds of inhabitants, the houses of which were in many instances built of bricks brought across the ocean in ships, since Americans had not then found out that they could not only beat Englishmen in building houses and ships but in making bricks and rearing soldiers and educating sailors. There were no steamships in those days, and as for railroads, cars and locomotives, they had only been dreamed of by the author of the book of Job; and for the matter of electric telegraphs, it took as long to carry the news from Boston to Bunker Hill as now from Japan to San Francisco and back by way of New York and London to Hong Kong. Nearly all the nations were cursed rather than blessed by kings—real potentates, who sported crowns and scepters, thrones and armies, and yet, not one in ten could write his name as well as a modern Bowery bootblack, and for the making of his mark in the world to any purpose, was not to be mentioned in the same day with an American newsboy of the present. There have always been kings, so we are told, from the days of Nimrod, the mighty hunter, who is presumed to have been one of earth's earliest monarchs, to the present time; and these, with their crowns, scepters and armies, have been creating something of a stir in the world; and yet, not Xerxes, with all his boats, crews, soldiers and sailors bridging the Hellespont shore to shore, could have resisted for an hour the grape and canister from one of the six-pounders which King George used with his war in the colonies; and these in turn, had an hundred been molded into one, would not have made a gun of half the caliber of an eighty-pound Parrot of to-day, mere playthings in American arsenals, and sitting pivot-poised on decks of our ships of war, a terror to evil doers.

And now, sitting in

OUR EASY CHAIR,

we will not write a history of the hundred years during which one nation, from being the smallest kind of a baby wrapped in swaddling clothes and all that, grew to be a big boy and was called Brother Jonathan; and thence up to fullest manhood, now challenges Johnny Bull to any kind of a trial either of skill or muscle—having bigger rivers, taller mountains, broader lakes, finer cities, faster steamers, more railroads and telegraphs, livelier newspapers, more enterprising journalists and bigger guns all round—kings and queens included—than a dozen tiny islands like Great Britain.

KINGS AND QUEENS,

did we say? Aye, that's what we sat down to write about. It's the first day of January, in the year of grace, one thousand, eight hundred and seventy-six—

CENTENNIAL YEAR—

and this is our first, possibly our last, Easy Chair, and we must have our say about the kings and queens, especially the latter. As regards the kings, it's the king bees we must notice, and nearly every live Yankee in America—to say nothing of our Dutch uncles and Irish cousins—are king bees; and for the queens, the whole land abounds with them, and fairer, more charming and beautiful queens have never been seen since the days of

MOTHER EVANGELINE.

Some, it is true—most, indeed—are better dressed and, though they couldn't probably get up a finer court costume out of fig leaves, they can beat all to pieces some of the fruits, to say nothing of the flowers which are understood to have grown in Eden, the plucking and eating of a single blossom or apple of which is presumed to have been the occasion of

OLD KING GEORGE

playing the tyrant, thereby begetting the big boy Brother Jonathan, since grown to be well known as

UNCLE SAMUEL.

It's a wonderful story is that of Time in the primer, and were we only young again, we might incline to sit down in Our Easy Chair and write it all out—the story of the kings and queens, inclusive of that of King Solomon with all his glory, the temple which he built, the greatest and most wonderful of its day and generation, nor forgetting to mention the "stone cleft out of the mountain without hands which the builders rejected, since made the chief of the corner"—or the crown, rich in jewels which sat on the brow of David, Israel's sweetest singer, and of the thrones and scepters of father and son, since gone to decay. And our story should

SIR WALTER SCOTT.—HIS EARLY DAYS. (See next page.)

tell of the kings of Assyria, of Babylon and Nineveh, of the proud Emperor who so fell down at the base of POMPEY'S statue, and gathering the folds of his mantle over his face as he fell, exclaimed—

"ET TU BRUTE!"

and that other, Prince of the House of David who, as he was hung up on the cross between the two malefactors, lifting his eyes to Heaven, said—"Father forgive them, for they know not what they do!"

Then there is the story of the queens—of ESTHER, the feast of AHASHUERUS, and of MORDECAI the Jew, sitting at the king's gate; of SEMIRAMIS, DIDO, HELEN, CLEOPATRA, and later of ISABELLA, (loveliest Queen of Spain,) MARY, Queen of Scots, JOSEPHINE, not to mention JOAN of Arc, nor forgetting MARY, mother of JESUS, and MARY MAGDALENE, and MARTHA, richest crowned in glory of all the queens of earth. Nor stopping there, our story should tell of all the noble and beautiful queens who, in this fair land, so sit beside our hearthstones and make our homes so many palaces, and bringing to us jewels, sons crowned with glory and daughters clothed in grace.

THESE ARE AS RUBIES,

and their praises would we sing were the story left to us to tell. But here comes the work of kings, the iron horse, dashing furiously along with his train behind. It is number twelve, sounding out the whistle down at Selo, and we must up from Our Easy Chair and hie away to the city. Come, Mrs. Easy Chair, we must be going. Take the old hickory throne, my son, from off the veranda, and carry it away to the garret and let it there remain till the spring-time and, should the grass grow and the flowers bloom for us again, as in each successive spring-time of the past, we will return again and sit in it and write on till all our writing is done. But should we not come back to again sit in Our Easy Chair, and should our scepter perish, nor again ever be taken up, tell daughter to gather immortelles and weave the garland anew, entwining the picture on the wall; and as for the vacant throne, let it be kept as an heirloom, to be handed down to our children and children's children; nor forget to tell those who shall come after that, as their grandfather went away, he did so trustingly and in faith to a country where, awaiting their coming, he will go on his journey

AMONG THE KINGS,

But be not sorrowful but full of hope, confidence and trust, and when the May queens, clothed in beauty, shall gather around them the nymphs of the hills and the rills, the King will return again, and sitting on the banks of the Genesee River—which being interpreted, meaneth

THE BEAUTIFUL RIVER—

will again sit on his throne and see the play go on.

And now will we send this, our first Easy Chair, as written for the RURAL, away to Colonel MOORE and, if he thinks it worth while, he may print it, and then shall it be read by thousands sitting on the banks of that river, all the way from where, bubbling out from earth in crystal springs among the mountains, its waters running along, now singing and babbling, then leaping over the rocks falls in cataracts or circling in eddy, find their way to the lakes and thence on to the ocean. A Happy New Year to those who, years ago, read our old

GENESEE VALLEY FREE PRESS,

in whose columns we used to tell about the gallant Editor of the RURAL, who with us so loved the fruits and the flowers, the fields and the forests, that he was only at home on the farm or in the garden.

A HAPPY NEW YEAR!

SIR WALTER SCOTT.

REMINISCENCES OF HIS EARLY DAYS.

[SEE ILLUSTRATION ON PRECEDING PAGE.]

IN the year 1771 there was born in the City of Edinburgh the little child who grew to be known throughout the world as Sir WALTER SCOTT, the great writer and poet. Both his parents were highly-educated persons, and perhaps this influenced the tastes and habits in which their son grew up. At about the age of eighteen months he lost the use of his right leg, after a severe attack of fever; but, although he was ever after lame, he was wonderfully brave and active as he grew older. Those earliest days were spent in his grandfather's house at Sandy-Knowe, and while he stayed at the old farm he would go with the cow baille and roll about on the grass for hours among the herds and flocks, making friends with the sheep and lambs, who soon knew the little lame boy. One of those days he was forgotten among the crags, and a thunder-storm came on; but when his aunt remembered where he was, and hastened herself in search of him, she found him lying happily on his back, watching the lightning and crying, "Bonny! bonny!" at every flash.

His grandmother used to tell him the old Border tales which she had heard in her own childhood, and so the names of JAMIE TELFER and other heroes were familiar to him, and he could repeat long pieces by heart from the stories and ballads with which his Aunt JANET amused him.

When he was about four years old WALTER was taken to Bath, with the hope that the mineral waters might cure his lameness, but very little change took place. In 1779 the lad returned to Edinburgh and was sent to the High School there, where he was placed in the second class, which contained some very good scholars, among whom SCOTT became a general favorite, from his mirthfulness and fun; besides, in winter he could tell any number of tales as they sat round the fire in a circle listening to him. Of himself, he says that he "disgusted his kind master" by his negligence and frivolity, as much as he pleased him by his intelligence and talent.

One tale which SCOTT has now and then told of his school days is this:—"There was a boy in my class," he says, "who stood always at the top, and with all my efforts I could not get above him. Days passed, but still he kept his place, do what I would; but at last I noticed that whenever a question was asked him he fumbled with his fingers at a particular button on his waistcoat. In an evil moment I removed it with a knife. When the boy was again questioned his fingers sought the button in vain; in his distress he looked down for it, but it was not to be seen, and as he stood confounded I took his place, nor did he ever guess who was the author of his wrong. Often in after life has the sight of him smote me as I passed by him, and I resolved to make him some reparation, but it always ended in good resolution."

When thirteen years old, young SCOTT first read PERCY'S Reliques, and this work had a great effect in making him a poet; still, before this time he had tried his hand at verse-making, some of which attempts were found in after days. The rupture of a blood vessel laid him on his bed for many weeks, and then his great amusement was reading; for he tells us he did nothing else from morning till night' unless some one was charitable enough to play chess with him. From a circulating library in Edinburgh he obtained many old romances and plays, and when tired of these he turned to histories, voyages and travels, and thus acquired a quantity of ill-arranged information, which proved useful in the literary work to which he devoted his life, and which has made his name famous.

In 1792 he was called to the bar as an advocate; but he had very little practice. His literary life then really began, which lasted for six-and-thirty years. In 1805 he gave to the public the "Lay of the Last Minstrel," and became the poetical favorite of the day. "Marmion," the "Lady of the Lake," and other poems followed. In 1814 he published the historical novel of "Waverley," but for several years it was a secret that he was the author of the book, who was spoken of as "the Great Unknown." In the next few years he published with his name several similar romances, among them "Rob Roy" and "The Heart of Midlothian." He assisted in starting "The Quarterly Review."

To his pen he owed his land and castle at Abbotsford, and from 1820 to 1826 he lived there like one of his own feudal chiefs; but in 1826 there come a commercial crash and the publishers of his books became bankrupt, and he was found to be liable for a vast debt. SCOTT set himself nobly to work to repay it. He overtasked his strength in the effort, and in 1832 breathed his last at Abbotsford, leaving behind him a name which will never be forgotten.

SOUTHERN "INDEPENDENCE."

THE Natchez (Miss.) Weekly Democrat is responsible for the following excellent sketch:

"Hallo, stranger; you seem to be going to market?"

"Yes, sir, I am."

"What are you carrying that plow along for?"

"Going to send it to Pittsburg."

"To Pittsburg, in Pennsylvania?"

"You're mighty right, I am."

"What are you going to send it there for?"

"To get sharpened."

"All the way to Pittsburg to get sharpened?"

"You bet! We've starved our blacksmith out. He pulled up stakes the other day and went to Texas."

"Well, that's rather a novel idea, my friend—sending a plow so far to get sharpened."

"Not so novel as you heard it was. We do our milling at St. Louis."

"Is that so?"

"You're right. It is. We used to have a mill at Punkinville Creek, but the owner got too poor to keep it up, and so we turned to getting our grinding done at St. Louis."

"You don't mean to say you send your grist all the way to St. Louis by rail?"

"I didn't say nothing about grits—we hain't got no grits to send. But we get our flour and meal from St. Louis."

"I see you have a hide on your wagon."

"Yes; our old cow died last week. March winds blowed the life out'n her. Sendin' her hide to Boston to get tanned."

"All the way to Boston? Is not that rather expensive, my friend? The freights will eat the hide up."

"That's a fact; cleaner than the buzzards did the old critter's carcass. But what's the use bein' taxed to build railroads 'thout you get the good of 'em? Used to have a tanyard over at Lickskillet and a shoemaker, too. But they're kerflummmixed."

"Kerflummuxed—what's that?"

"It means gone up the spout. And 'twixt you and me, that's mighty nigh the case with our State."

"When do you expect to get your leather?"

"Don't expect to git no leather at all—expect to get shoes some day made at Boston or thereabouts."

"Rather a misfortune to lose a milk cow, my friend."

"Not so much a misfortune as you heard it was. Monstrous sight of shuckin' and nubbin' in a cow, and milkin' her night and mornin', and gettin' only about three quarts a day."

"What are you going to do for milk?"

"Send North for it."

"Send North for milk?"

"Yes, concentrated milk and Goshen butter."

"Oh! I see the point."

"Mighty handy things these railroads—make them Yankee fellers do all our jobs for us now—do our smithin', and grindin', and tannin', and milkin', and churnin'."

"I see you have a bale of cotton."

"Yes; we go our bottom nicket on cotton. Sendin' it up to Massachusetts to get it carded, spun and wove. Time'll come when we'll send it there to be ginned—then we'll be happy. Monstrous sight of trouble running these gins."

"That would be rather expensive, sending cotton in seed."

"No more so than them Western fellers pays when they send corn East and get a dollar a bushel and pay six bits freight. Besides, as I said, what's the use of paying for railroads 'thout we use the roads?"

"You seem to appreciate the advantages of railroads."

"I think we ought—we pay enough for 'em."

"I reckon you fatten your own pork?"

"Well, you reckon wrong, stranger. I get them Illinoy fellers to do that for me. It's mighty convenient, too. Monstrous sight of trouble toting a big basketful of corn three times a day to hogs in a pen—'specially when you hain't got none to tote it to."

"I should think so."

"There's one thing lacking, though, to make the business complete."

"What's that?"

"They ought to send them hogs ready cooked. Cookin', and preparin' wood for cookin', takes up a heap of time that ort by rights to be employed in the cotton-patch. I was sayin' to my old woman the other day, 'If we Mississippi folks got our cookin' and washin' done up North and sent by express, we'd be as happy as office-holders."

"Your horse in the lead there seems to be lame."

"Yes—needs shoein'. If he wasn't the only horse I've got, and I can't spare him, I'd send him up where they make the horseshoes and nails and get him shod. Can't get such a thing done in our parts. Perhaps I can at the depot."

"How do you manage to live in your parts, my old friend?"

"Why, we raise cotton. My road turns off here, stranger. Gee, Ball! back, Brandy. I'm glad I seed you, stranger."

THE CALIFORNIA WINTER.

THE most delightful weather in California, from January to December, is that which we enjoy in the intervals between the winter rains. Of winter, in the old-fashioned sense, we know nothing in San Francisco. We have no winter, and what we conveniently call a winter is simply a season in which a few days of steady and persistent rain are alternated with days of bright blue skies, of cheerful sunshine, and of an atmosphere more delicious than that of Indian summer in New England. Of the stern and terrible rigors of winter, as they are experienced in less favored climes, we know nothing in San Francisco, except from hearsay or tradition. Whittier's "Snowbound," and the story of the old homestead covered up to the second floor with the snowfall of a single night, of the trees, laden with the weight of the flaky deposit, of the gables adorned with gigantic icicles, seems almost as strange to us as a tale out of the "Araidan Nights." Of such winters as these the southern portions of California have no practical knowledge. There are some localities of the State, it is true, where in December and January snow falls to the depth of from five to fifteen feet, and travel is utterly impracticable except by the aid of snow shoes. But in the neighborhood of San Francisco, and to the south of it, all along the coast range, the winters are more delightful and more salubrious than any season known in the Atlantic States. We speak of "the climate of California;" but the fact is that California has a score of climates. Right here, within a circuit of thirty miles from San Francisco, an hour's travel will carry a man from one climate to another as diverse as those which in other countries have an interspace of hundreds of miles. San Francisco, Oakland, San Rafael and San Jose have climates essentially distinct, and all delightful. It is not to be wondered at that as the facts in regard to the State are becoming known the number of immigrants and visitors in search of health is steadily increasing. In the month of October last the largest number of passengers that ever reached the State since the opening of the railroad in 1869 arrived here. The total number was 7,495. In October of last year the arrivals were 5,019. There is no doubt at all that as the manifold advantages which California can boast over the less favored States on the Atlantic seaboard become more widely known the immigration will steadily increase.—*San Francisco Chronicle.*

WASHINGTON'S HORSES.

ACCORDING to G. W. P. Custis' recollections, the grooming of Geo. Washington's white horses was something surprising. The night before these horses were expected to be ridden they were covered entirely over with a paste, of which whiting was the principal component part; then the animals were swathed in body clothes and left to sleep upon clean straw. In the morning the composition had become hard, was well rubbed in and curried and brushed, which process gave to the coats a beautiful, glossy and satin-like appearance. The hoofs were then blackened and polished, the mouth washed, teeth picked and cleaned, and the leopard-skin housings being properly adjusted, the white chargers were led out for service.

THINGS are not to be done by the effort of the moment, but by the preparation of past moments. *Anon.*

Sabbath Reading.

CONSECRATION.

TAKE my life, and let it be
Consecrated all to Thee;

Take my hands, and let them move
At the impulse of Thy love;

Take my feet, and let them be
Swift and beautiful for Thee;

Take my voice, and let me sing
Only for my Lord the King;

Take my lips, and let them be
Filled with images from Thee;

Take my silver and my gold,
Not a mite would I withhold;

Take my moments and my days,
Let them flow in ceaseless praise;

Take my intellect, and use
Every power as Thou wilt choose;

Take my will and make it Thine,
It shall be no longer mine;

Take my heart, it is Thine own,
It shall be Thy royal throne;

Take my love, my Lord, I pour
At Thy feet its treasured store;

Take myself, and I will be
Ever only, Lord, for Thee.

A CHILD'S PRAYER.

SHE was hardly able to talk plainly, and an officer had to give her his hand to assist her up the steps into the Central Station.

"Did you put my mother in jail?" she asked as she pushed her sun-bonnet back and looked from one to another.

They had arrested a red-faced, tangled-hair woman, who fought the officers and made use of foul language. No one dreamed that the child was hers, but it was. The little thing was so innocent and pure that they didn't want her to even see the iron bars, but the mother heard her voice, called to her and they opened the corridor door. The child grasped the iron door, looked into the cell, and cried out:

"Why, mother, you are in jail!"

The mother crowded back, ashamed of herself, and the child knelt down on the stone floor, clung to the iron bars of the door, and prayed:

"Now I lay me down to sleep, and I hope my mother will be let out of jail!"

The men had tears in their eyes as they gently removed her, and when the woman came into court in the morning to be tried, the Judge told her to go home and try for that child's sake to be a mother instead of a wretch.

HEAVEN.

A LITTLE boy was walking in the fields with his mother, one day. He looked up to the sky and said, "O, mother, Heaven is so *far off*, I'm afraid I shall never get there."

"My dear," said his mother, "Heaven must *come to us* before we can go to it."

He didn't understand what she meant. Then she told him what Jesus said when He was on earth. These were His words:—"If any man love Me, my Father will love him, and we will come unto him and make our abode with him." Jesus is willing to come into your heart. He is standing and knocking for you to let Him in. And when He comes in He brings Heaven with Him. He will make a Heaven in your heart, if you will let Him come and dwell there. But, if we don't let Him come and dwell in our hearts *here*, He won't let us go and dwell with Him in Heaven hereafter. Heaven must come to us before we can go to it.

THE GARDENER'S LESSON.

TWO gardeners had their crops of peas killed by the frost. One of them was very impatient under the loss, and fretted about it very much. The other went patiently to work at once to plant a new crop. After a while the impatient, fretting man went to his neighbor. To his surprise, he found another crop of peas growing finely. He asked how this could be.

"These are what I sowed while you were fretting," said his neighbor.

"But don't you ever fret?" he asked.

"Yes, I do; but I put it off till I have repaired the mischief that has been done."

"Why, then you have no need to fret at all."

"True," said his friend, "and that's the reason I put it off."

PRAYER.—Prayer is the rustling of the wings of the angels that are on their way bringing us the boons of heaven. Even as a cloud foreshadoweth rain, so prayer foreshadoweth the blessing; even as the green blade is the beginning of the harvest, so is prayer the prophecy of the blessing that is about to come.—*Spurgeon.*

LOVE is its own perennial fount of strength. The strength of affection is a proof not of the worthiness of the object, but of the largeness of the soul which loves.—*Rowland Hill.*

WITH men the heart is known by our words; but with God our words are weighed by our hearts.—*Bernard.*

GOD sees hearts as we see faces.—*George Herbert.*

Ladies' Portfolio.

THE EVER-NEW QUESTION.

Do I love you? Do I love you?
Ask the heavens that bend above you
To find a language and to prove you
If they love the living sun.
Ask the burning, blinded meadows
What they think about the shadows,
If they love the falling shadows
When the fervid day is done.

Ask the bluebells and the daisies,
Lost amid the hot field-mazes,
Lifting up their thirsty faces,
If they love the summer rains.
Ask the linnets and the plovers,
In the nest-life make for lovers,
Ask the bees and ask the clovers—
Will they tell you for your pains?

Do I, darling, do I love you?
What, I pray, can that behoove you,
How in Love's name I can move you,
When for Love's sake I am dumb!
If I told you, if I told you,
Would that keep you, would that hold you
Here at last where I enfold you?
If it would—Hush! Darling, come!

ON FOUNDING A HOME.

FIRST secure a home, which is, a house to live in, and the proper people in it to compose the foundations of home life. Directions as to house decoration or skillful cookery, or the control of cook or chambermaid, are of very little account, if the people who sit down in the pretty rooms day by day find their hearts torn by jealousy, or their brains rasped by nervous irritation. Let Tom and Amelia turn from the altar, resolving to start fair and give themselves the largest chance of a clear understanding of each other, and, in consequence, of future happiness. Let them turn their backs on boarding-houses, shut their eyes to all considerations of style, be deaf to all hints of Mrs. Grundy's expectations, and buy or rent a house within their means. If they are too poor for a house, then a flat; if not a flat, a room; or, if the worst comes to the worst, let them hire, like our friends at Rudder Grange, a canal boat; only let them go to housekeeping, and *go it alone*. Comfortable quarters, perhaps, are offered them in the house of one of their parents, who very naturally try to keep the young birds just mated a little longer in the old nest, especially if they are well-to-do people, to whom the addition to the family will be only a pleasure, and no burden. Amelia's husband not being able to support her in the style to which she is accustomed, what can be more proper than that they should occupy part of her father's mansion, and reap the benefit of well-trained servants, carriages and sumptuous fare? Or some other motive of economy or affection dictates their plans. Amelia's mamma being a widow, and devoted to her child, why should she live alone in her house, peopled for her, perhaps, by ghosts of the beloved dead? Why not take the spare room in the young people's house and make a part of their new life? Or it may be Tom's unmarried sister or bachelor uncle who comes in to make a third in the partnership just begun.

Now this new comer may be the most clever, amiable, dearest soul in the world, and the arrangement one dictated by prudential motives and affection; but ninety times in a hundred it is destructive of the fine tone and temper of the newly formed household. The first year of married life is a passage, at the best, over dangerous quicksands; no matter how intimate their knowledge of each other was before marriage, husband and wife have now to find each other out in a thousand new and unexpected phases, and to adjust themselves each to the other in the habits, tastes, even language of every day. It will require all the tact and the patience which love gives to enable them to do this, and the interference, even the presence, of a third party, is always a disturbing element. The more near and dear the relations of this third party, the more apt are they to come between the wife and husband. Unfortunately, too, the whole tone of married life usually receives its key-note from this first year; and so invariably damaging is the influence of outsiders upon it, that the best recipe, probably, to insure a happy marriage, would be to make a holocaust of all kinsfolk on the wedding day. As that is not practicable, let Amelia and Tom live as much apart as is possible for at least twelve months, selfish as such reserve may appear to their families.

After they have become in a measure one, and the uncertainty and disquietude of the storms and sunshine of early marriage have given place to a settled home atmosphere, the occasional presence of strangers has usually a wholesome influence. With the companionship of a guest now and then, Tom and Amelia are less likely to find their thoughts and opinions grow stale and tedious. Charity, too, assumes, no more beautiful form than in a gracious hospitality, especially to those who are needy in body and mind. We know certain households where there is always to be found an orphan girl going to school with the other children, or a helpless old black "Aunty" in her chair by the kitchen fire, or some other waif warmed and sheltered from the cold without. We remember a certain young girl who, like most Virginian women, was skilled in housewifery, who took into her father's house, one after another, girls of fourteen from an adjoining mill, and trained them herself as seamstresses and cooks, teaching them to read and write at the same time. Before and after her marriage she fitted and placed eight women in useful, honorable careers of life. The home, when founded, should always be large enough to give place to some creature needing help, or it may be too small for any blessing to rest upon, which falls like dew from above.

BIRDS AS ORNAMENTS FOR BONNETS.

Do ladies know when they purchase their bonnets—do they realize that the birds, with which they are bedecked, were once alive—were once the lovable little creatures that flit from shrub to tree, enlivening the morning with their joyous, inspiring song, and investing nature with one of her freshest, most captivating smiles? If the ladies who purchase bird-bedecked bonnets, knew that they are the indirect cause of a slaughter of these innocents that threatens "the annihilation of our favorite little songsters"—would not the savage fashion soon fall into a richly-merited disgrace? Could they see these happy, harmless beings hunted, as we have seen them, by a pack of rough-sculf boys and men that skulk about the surroundings of cemeteries, parks, and even garden-walls, to entrap or shoot them—would not the sight of their poor little bodies, arranged among the artificial flowers of the hat in imitation of their graceful movements as in life, inspire them to frown upon a fashion so conceived in cruelty—so suggestive of cruelty to the young—so hateful to the tenderness with which womenkind are wont to cherish those bright creatures?

Bird catching for the milliner is a well-established and profitable business, and our readers have only to ride out to the suburbs of our cities in early spring to ascertain something of its magnitude. In the first copse, or grove, they will find trap-cages set here and there, each with a singing bird within to attract those which happen near. Scattered about are sticks, three or four feet in hight, besmeared with bird-lime. Concealed in thickets or behind trees are the bird-catchers, ready to shoot those wary birds that are likely to escape both the vicious sticks and the trap-cages. The worst of it is, the little birds are killed so as not to derange or soil their brilliant feathers. If shot, the bird-catcher aims only to cripple, not to kill—since this would, in many instances, cause a wound that would greatly mar their beauty and lessen their money-value.

Thus, not to speak of their value to the farm and garden as insect-destroyers, our ornamental birds, as we may call them—ornaments to lawn, field and woods as children are ornaments to the household—are being destroyed for the ornamentation of bonnets!

Perhaps all this is more sentimental than reasonable. Birds are killed to eat, why not to adorn bonnets! We prefer not to discuss the question. To any lady that would raise it, we would kindly suggest that she breed her own humming and Canary birds. Then, while learning something of bird culture and while enjoying for a period their company, she might kill them as they were needed, and the community at large, no longer sufferers, would hold their tongues. E. S. C.

HOW A WOMAN MADE A FORTUNE.

Six years ago Mrs. Mary Ahark, says the Laramie Sentinel, was living in a little tent on the edge of the town. Her whole worldly possessions consisted of this tent, a straw bed, two or three boxes which served as chairs and table, a seven or eight year old girl, and two cows and calves. She sold the spare milk of these two cows, carrying it around town with a tin pail, and with the product and from work she did for neighbors supported herself and child. When she could get three or five dollars ahead she would buy another calf or yearling. It is not our purpose to trace her progress up to the present time, but the result is that now, in less than seven years, she has several hundred head of cattle, a fine farm, with nice buildings and improvements, a comfortable, even luxurious, home, and, instead of carrying milk around by hand, rides in her own carriage. Her daughter is an educated and accomplished young lady. Mrs. Ahark's property is now valued at from $40,000 to $50,000, and she has made it all by honest industry and good management. She has had no outside help. She never had a Government contract nor fell heir to any property. "By industry we thrive."

ROMANCE IN REAL LIFE.

SOME thirteen years ago a man named Jerry Toner left his wife and children at Ovid, N. Y., and settled down in Massachusetts, where he married another woman. The deserted wife applied herself to business, and not only raised her children respectably, but accumulated some property. The other day the truant husband unexpectedly appeared, with repentant mien, at her door. He told her that his second choice was dead, and he was left with four children who needed a mother's care. He asked her to forget the past, to once more link her fate with his and become a mother to his children. Forgiveness and compliance followed, and the apparently happy couple at once settled up affairs at Ovid and left for their Eastern home.

SIXTEEN LADIES gathered in front of Williston Vt. Seminary, during a recent sleighing time, and, shovel in hand, proceeded to remove the snow from the side walk in front of the premises while professors and students looked on in amazement. On the completion of the work the ladies received three cheers, and departed in good order. The Seminary authorities, it is hoped, feel properly ashamed of themselves.

A MAN may as well expect to grow stronger by always eating, as to grow wiser by always reading. —*Collier.*

Reading for the Young.

WHAT WOULD YOU THINK?

WHEN walking out some summer's day,
What if a little bird should call,
And on your shoulders perch and say,
"Speak well of all or not at all!"
What would you think?

What if you chased and caught for fun
An airy, gaudy butterfly;
And on its wings there in the sun
You plainly saw the words, "Don't lie!"
What would you think?

What if you watched an opening rose
Spread all its petals to the air,
And to your wondering gaze disclose
Two little warning words, "Don't swear!"
What would you think?

What if you sought to rob the birds,
And hunted for their nests with zeal,
But found each egg traced o'er with words,
As plain as print "Dear boy, don't steal!"
What would you think?

A WORD TO TO THE GIRLS.

BY MINNEHAHA.

IN the RURAL of Sept. 18th, Cousin MAUDE writes a brief, interesting letter, surprising me by the assertion that she is "through" with studies that I have not thought of finishing; expressing a desire to become a teacher, and asking if it might not be in "a year or so," adding the portentous assertion of a friend's "too young and small." This last brought to mind two teachers who are associated with earlier years, and a sunny New England school-house. It was never satisfactorily settled between the scholars whether the first was old enough or not—her age being uncertain, known to but her—the adequate size, however, was not disputed, her average weight being two hundred lbs. Notwithstanding the general belief of others, that she was "old enough and big enough" to teach—the school proved a failure. Her successor was a little bit of a woman, with a heart brimful of patience and sunshine, who, through the two long terms, molded the most obstinate to her will. She was young and understood our rebellious natures, leading with a kind, firm hand that commanded our respect, and even the worst boy in school mourned her departure. I had thought my words of advice could be of no assistance, and hoped that Cousin JONNIE would steal time enough to favor us with a "little preach;" she would say it in such a perfect way, while I never could grasp the words most needed.

Not only MAUDE, but hundreds of young girls who read the RURAL, are thinking seriously of a teacher's life—a life of toil and responsibility. It is to them I would say a few words. First secure a good, strong constitution; the list of weak, sickly teachers is sufficiently large now. If there is any one place requiring a healthy ruler it is the school-room. By *ruler* we don't mean one of those dark, suspicious pieces of timber that flourish in dangerous proximity to head and hands sometimes. If we could have our choice we would like that special kind to be decidedly weak. Girls, do not pore over your books too much during your "teens." Don't burden the mind, thus injuring the body. Just spend those years in a manner allowing you to grow. Grow in body—grow in mind and soul. You cannot tax one without detriment to the rest. Suppose we let the body grow, as it wants to, strong, hardy and beautiful, as the Maker designed it; is not the brain, too, expanding, becoming firmer, and more capable of retaining the endless amount of knowledge with which we would crowd it? Remember, if you are using all your energy—all your strength for the mind, the body suffers.

You want a good memory, do you not? Then don't crowd the whole of a common school education within that skull while it is growing. It is all very nice to swallow WEBSTER'S Speller before one is ten years old, and other studies in a similar manner; but, when a few years have passed, and there is a desire to make use of that knowledge, we wish we had stopped to chew. You know, Cousins, what a confusion it makes when flower seeds of different varieties get mixed. That is about the way learning has been tumbled into my cranium, and the consequence is I have to assort, reject, take up with inferior; then, long afterward, will appear the very article wanted.

Learn a little every day, and let that little be *learned*—not merely committed, but labeled and secured in a snug corner from where it can be brought at a moment's notice. Take time to do it well. At home let some older member of the family do the sewing, and you strengthen your muscles, benefiting yourself while assisting others. When the work is done don't be afraid to play—not croquet nor other like boisterous (?) games. While you can have short dresses use your feet; learn to run *easily*; it is an art, and one that may be of use to you some day. Are your shoulders out, like the letter T, or drooping inward, hurling your health and appearance? Just toss me a ball, and I'll show you the cheapest way to put them where they belong. A girl can be every bit a *lady*, yet play an occasional lively game. It is not hoydenish. It was our good, grey-haired pastor who taught "us girls," so it *must* be right.

Let me close by asking you to continue this course till the roses are firmly planted in your cheeks—till you can eat plain bread and relish it—go to sleep at night as soon as your head touches the pillow, and waken in the morning as if you had never experienced a tired feeling in your life. Then it will do to talk about teaching. Good-by, and kind wishes.

THE FIRE THAT OLD NICK BUILT.

WE find in an exchange the following capital imitation of the "House that Jack Built," and wish that it might become a household favorite:

Intemperance—This is the fire that old Nick built.

Moderate Drinking—This is the fuel that feeds the fire that old Nick built.

Rum-selling—This is the axe that cuts the wood that feeds the fire that old Nick built.

Public Opinion—This is the sledge, with its face of steel, that batters the stone that grinds the axe that cuts the wood that feeds the fire that old Nick built.

A Temperance Meeting—This is one of the blows that we quietly deal to fashion the sledge with its face of steel that batters the stone that grinds the axe that cuts the wood that feeds the fire that old Nick built.

Temperance Pledge—This is the smith that works with a will to give force to the blows that we quietly deal to fashion the sledge with its face of steel that batters the stone that grinds the axe that cuts the wood that feeds the fire that old Nick built.

Eternal Truth—This is the spirit so gentle and still that nerves the smith to work with a will to give force to the blows that we quietly deal to fashion the sledge with its face of steel that batters the stone that grinds the axe that cuts the wood that feeds the fire that old Nick built.

NOW!—YES, NOW!

A SHORT word; a shorter thing. Soon uttered; sooner gone. "Now!" A grain of sand on a boundless plain. A tiny ripple on a measureless ocean! Over that ocean we are sailing; but the only part of it we possess is that on which our vessel at this moment floats. From the stern we look backwards and watch the ship's wake in the waters; but how short a distance it reaches, and how soon every trace disappears! We see, also, some landmarks farther off, and then the horizon closes the view; but beyond, that ocean still rolls far, far away. Memory contemplates the few years of our individual life; history shows us a dim outline of mountains; science tells us that still farther back, out of sight, stretches that vast sea; reason assures us that, like space, it hath no boundary; but all that we possess of it is represented by this small word—now! The past, for action, is ours no longer. The future may never become present; it is not ours until it does. The only part of time we can use is this very moment—Now!

The Puzzler.

HIDDEN STATES.—No. 1.

1. NEVA, darling, do you love me?
2. His skin is florid, and his hair auburn.
3. In Diana's temple magnificence abounded.
4. Oh! I only want to see mother once more.
5. Oliver, Mont Blanc has been scaled by ladies.
6. That is not a pecan but a hazel nut.
7. Did you ever notice the color a dove's wings are?
8. Examine that quartz ore, Gonzales.
9. The Indian chief Kenebra skates splendidly.
10. Alas! Katie has left us.
11. Dio watered the garden.
12. Instead of trying to connect, I cut the last link.
13. We are in the vortex, as I feared.
14. Mamma, Rylando does not drink.
15. Fan, Ewy or Kate will be a widow ere the Doctor comes.
16. Yes, sir, Miss is sipping orange ice at Delmonico's.
17. Mamma, I need the money.
18. In Vermont a nail factory was burnt.
19. Still Ino is very, very ill.
20. Miss, our ice has given out.
21. Dela, warehouses are expensive property.

☞ Answer in two weeks. LITTLE ONE.

BIBLICAL ENIGMA.—No. 1.

I AM composed of 23 letters:
My 1, 2, 4, 21, 15 was an idol worshiped by the children of Israel.
My 7, 4, 11, 20, 22 was a famous sorcerer.
My 13, 9, 1, 17, 12 was a king of Egypt.
My 16, 4, 10, 18, 5 was a Jewish ornament.
My 19, 9, 3, 14, 11 was a lake in Judea.
My 23, 4, 6, 21, 8 was a companion of Paul.
My whole is found in the New Testament.

☞ Answer in two weeks. ISOLA.

PUZZLER ANSWERS.—Jan. 1.

ILLUSTRATED REBUS NO. 1.—Little Women (Alcott); Ten times One is Ten (Hale); B. O. W. C. (Ike Mills); Running to Waste (Baker); Fast Friends (Trowbridge); We Girls (Whitney).

PUBLISHER'S SPECIAL NOTICES.

The Rural is a very good present to send to a friend, and it pleasantly reminds the recipient of the donor fifty-two times a year—this year fifth-three times. Any *subscriber* can send it to a relative or friend, as a present, at our lowest club rate—only $2.15, including postage.

Holiday Presents will be plenty this year among our Agent-Friends and others who form clubs for RURAL. Our list comprises many articles appropriate for presents. Induce a few of your friends to take the RURAL, and thus secure a Premium.

Officers of Agricultural Societies and Clubs, Granges, &c., can, if they will, materially aid in augmenting the circulation of the RURAL. Scores of such are already forming clubs; how many others will kindly do likewise?

Renew early if you would secure the uninterrupted continuance of the RURAL to your address: and pray don't forget to ask friends to join you in sending for the Fifty-three Numbers which we shall publish during 1876.

Back Numbers of this Year (from Jan. 1) can be furnished to all new subscribers, but we shall not send them hereafter unless specially requested. Those who desire can begin with any number, however.

The Best Paper, and the Best Premiums to Agents, is our motto. We ignore Chromos and all other cheap colored pictures, preferring to put our money *in the paper*, and in Premiums to Agents.

Select Your Premiums.—All persons entitled to Premiums will please designate what they prefer and notify us how and where to forward—whether by Freight or Express—if articles are not mailable.

Act as Agent!—Reader, if there is no agent for the RURAL in your locality please become one by forming a club. *It will pay.*

At Our Risk.—You can remit by Draft, P. O. Money Order or Registered Letter *at our risk.*

News of the Week.

HOME NEWS PARAGRAPHS.

WHILE California produces 8,000,000 gallons of wine, the home consumption does not amount to more than 1,500,000 gallons. In first hands the wines are known to be absolutely pure, for which reason they are extensively imitated by a fraudulent article abroad, or so adulterated as to entirely lose their original virtue and flavor.

The coldest winters on record in the United States within the past 100 years were those of 1780, 1833 and 1856. In 1780 the Delaware River, Bay of New York and Long Island Sound were so completely icebound as to be crossed with horses and sleighs. The coldest year was that of 1816, in which there was ice in every month in the year.

One of the curious incidents of the holiday season is a call from the British Post-Office Department for a remittance of £150,000 on account of money orders drawn in the United States on Post-Offices in Great Britain, in excess of similar orders drawn there upon offices on this side of the Atlantic. The unusually large balance is explained by the large number of emigrants from the British Empire who make use of money orders in remembering "the old folks at home" at Christmas and New Year's.

The Russian Minister rather astonishes the natives in Washington. At a wedding, which occurred there recently, his Excellency and wife were preceded by their chasseur, who stood during the ceremony with drawn sword glittering savagely in the gaslight. The madam, notwithstanding it being a house wedding, and a full dress affair, appeared in a black velvet underskirt, brown silk overskirt, and seal skin sacque. She evidently doesn't depend as much upon her toilet as did the famous Mme. Catacazy, whose striking beauty was greatly enhanced by her exquisite toilets.

The San Francisco Bulletin bemoans the use of narrow carriage tires, which are rutting their streets badly, and points longingly to Paris, where tires are taxed, the narrowest paying the largest license and the widest almost nothing.

At the annual sale of pews in Plymouth church, Brooklyn, on the evening of Dec. 4, the amount received for rentals, etc., was $63,680 against $70,319 last year.

Hamilton, Richardson & Whitney, dry goods jobbers, of Boston, are reported to have failed. Their liabilities are stated to be $350,000.

In the libel suit of Metcalf agt. the Boston Herald, to recover $10,000 damages, the jury returned a verdict in favor of the plaintiff for $1.

The Maine Legislature assembled Jan. 5. The Senate was organized by the choice of Gen. Thomas W. Hyde of Bath as President. The House chose Col. Fred. Roble of Gorham, Speaker.

At an informal meeting held at the Arlington Hotel in Washington, Jan. 5, which was composed of prominent citizens of the District of Columbia, preliminary steps were taken to induce the Democratic and Republican National Committee to select Washington as the place in which to hold their respective National Conventions. The argument was advanced that the public generally would rejoice in an opportunity to visit the Capital during the Centennial year.

Petitions are being circulated throughout Iowa praying the Legislature to introduce homœopathy into the medical department of the State University.

The number of convicts in the Arkansas penitentiary and the number of hangings this year are double that of any year in the history of the State.

Wyoming Territory has a new county named Crook, not named after crooked whiskey, but after Gen. Crook, who commands the Department of the Platte, and who has done more effective and judicious work among the Indians during the past few years than all the brigadiers on the frontier combined.

One of the saddest results of the war is the almost total extinction of the rice industry in the Cape Fear district. Immense tracts of rich swamp land, drained at immense cost, ditched, banked, and cultivated with the nicety of a garden, have reverted to nature and become a hideous morass. The ruin is so complete that it seems impossible now that money or labor can ever again retrieve it.

Minister Washburne has written a letter declining to run for the Presidency.

Col. Lamar was last week unanimously nominated United States Senator from Mississippi.

The Louisiana Democrats adopted a platform of hostility to Gov. Kellogg, resolving to ask Congress for relief.

Dr. Linderman favors Indianapolis for the site of the new branch mint.

The Chamber of Commerce of this city has adopted a memorial to the Legislature for putting the canals under a Superintendent of Public Works.

It is expected that additional suits against the Brooklyn Ring will be brought.

Great depression is reported to exist in the market for the sale of ship property at the Marine Exchange of this city, caused mainly by a falling off of the foreign demand, which for several months past was the main support of the market.

The Newark, (N. J.) Library Association held their annual meeting last week. On Jan. 1 there were 22,223 volumes in the library, an increase of 1,036 since last year. The average number of volumes drawn monthly last year was 4,069. The total receipts were $6,117.58, and expenditures, $5,593.12.

Joseph Smith, son of the Mormon prophet, and President of the organization called the True Latter-Day Saints, says the new institution comprises about 15,000 members scattered throughout the United States, Europe, and the Sandwich Islands. They adhere to the "original faith," denounce polygamy and reject Brigham Young's claim to the leadership. In Mr. Smith's estimation polygamy will never be abandoned by the Mormons. It must either be crushed out by superior power or sapped by overpowering public opinion. Polygamy exists to-day by failure of the people of the United States to enforce their own moral enactments.

The Washington correspondent of the Milwaukee News says that the navy is doomed to a great reduction in officers and men, as well as in vessels. There are over 1,600 officers on the active list, a number which can be reduced at least one-third without detriment to the service. The writer adds: "Mr. Randall promises to play sad havoc with Robeson's estimates for the next year, and the whole House is determined to hold him to a strict accountability for the money spent."

Hamilton County, Iowa, is paying for its new court house with 1,360 acres of land. Better than to issue bonds bearing a high rate of interest and then repudiate them, like some counties in Illinois and Missouri.

Mr. Philip Stiner closed his eighteen tea stores in this city and the two in Newark, N. J., Jan. 5. He has made an assignment to Mr. Isaac Sommers. According to the schedule of the assignment filed recently, his assets are $35,534.87, and his liabilities $137,086.06. His largest creditors are Ockershausen Brothers of 81 Wall street, who are down for $16,181.15. The stock in all his stores at the time of failure is estimated to be worth about $11,000. Mr. Philip Stiner is a brother-in-law of Mr. Joseph Stiner of Messrs. Joseph Stiner & Co., who have twenty retail stores and one wholesale tea store in this city. Philip Stiner left his father Jacob and commenced the tea business on his own account about six years ago. He essayed to rival the extensive business of Messrs. Joseph Stiner & Co., and had like them branch stores all over the city. His business was never so large as theirs, however, and of late it has dwindled materially. His failure is owing to the general depression in trade. Mr. Stiner's friends deny that either his extravagance or any defalcation of his employees had anything to do with the failure. He lives in a quiet way in West Forty-seventh street.

The Coroner's Jury in the Boston explosion case pronounces the accident to have resulted from the negligence of the men in charge of the pipes.

The United States store-ship Supply will shortly be sent to the Mediterranean to bring home goods for the Centennial from the countries bordering on that sea.

Fees for 1876, under the Connecticut license law, to the amount of $30,000, have already been paid into the Hartford City treasury.

Chicago reports eastern freight rates weakening and that a reduction will be made shortly.

Orders have been received at the Charlestown (Mass.) Navy Yard for a general reduction of the force, to go into effect on the 10th inst. It throws about 600 men out of employment.

The Milk Dealers' Association of New York City held a meeting last week to prepare the draft of a bill to regulate the sale of milk, and which they intend to introduce into the State Legislature. Prof. Doremus was present. The Committee appointed to draft the bill had not yet agreed upon several important points, and the Association decided to wait until they could hear the views of Prof. Doremus upon the milk question before the Medico-Legal Society, as well as the opinions of the members of that body.

The Texas Democrats have nominated Richard Coke for Governor.

W. C. Stone, Utah emigration agent, has arrived in Washington from Salt Lake City, and brings with him petitions signed by 23,560 Mormon women addressed to Congress, praying the United States to give Utah a State Government.

During the year 1875 there were 12,433 deaths in Brooklyn, an increase of 1,422 over the previous year. The deaths from small-pox were 624, and from diphtheria 963.

Larkin G. Mead's statue of Ethan Allen, which is in the possession of the State of Vermont, will probably be exhibited at the Centennial Exposition.

Gov. Dingley of Maine was presented with a bronze statue of the muse of History by the members of his staff at the expiration of their terms of office last week.

The Rev. Dr. T. DeWitt Talmage, upon invitation of prominent clergymen in Western cities, has agreed to deliver lectures on the subject of the expulsion of the Bible from the public schools, in Cincinnati, Cleveland, Indianapolis, Dayton and other cities.

The Legislature of this State was organized on the 4th inst. Judge Robertson of Westchester was elected President pro tem of the Senate, and Gen. J. W. Husted (of the same county) Speaker of the Assembly.

FOREIGN NOTES.

THE little Isle of Man is accorded by England the privilege of self-government—a privilege which is denied to her greater neighbor, Ireland. And it seems that home rule is too much for the Isle of Man. The Legislature of the little country not only claims the prescriptive right to punish for contempt committed in its presence, but has lately passed a bill by means of which it proposes to hold the editors of the Manx newspapers for "constructive contempt." Of course, such an outrage could not be permitted anywhere in the British dominions, and Queen Victoria will, without doubt, find a way to veto this absurd enactment. Already the people have met at Douglas, the capital, and recorded a protest against "a subordinate legislature in a small place having such power." "Constructive contempt" is too much for even the peaceable, submissive citizens of the Isle of Man.

Paris during the coming fiscal year will expend about $40,000,000, a large portion of which will be for embellishments. The receipts as well as the expenditures of the city have quadrupled since 1847, although the population in the same period has not quite doubled itself.

The Egyptian troops recently butchered in Abyssinia were drawn into a narrow defile, when they were surrounded. The Abyssinians were armed with Remington rifles, had mitrailleuse, and were led by an Englishman. Some French officers were also among them.

Late advices from Tafalla state that several Carlist officers and soldiers have been shot at Estella for a conspiracy against Don Carlos. It is asserted at Hendaye that the Carlists raised the siege of Hernani in consequence of a decision to that effect of a council of war.

Cardenas has been appointed Spanish Embassador to the Vatican.

Raouf Pasha has been appointed Governor-General of the Island of Crete.

Ali Pasha, formerly Embassador at Paris, has been appointed Governor-General of Herzegovina.

Sir. John Hawley Glover has been appointed Governor of Newfoundland.

Dr. Gerlich has been appointed German Vice-Consul at New York in place of Herr Feigal, who has been appointed Consul at Havana.

Austria is evidently preparing for war. It is reported that all men in Vienna who are liable to serve in case of war have been ordered to hold themselves in readiness to join their respective corps on 48 hours' notice.

The holiday presents in Paris this year were perfectly gorgeous. The toy shops, for instance, were peopled with dolls, not dolls such as may be found in English nurseries, but fine waxen ladies, dressed in the latest fashion, with their real hair arranged according to the latest prevailing feminine tastes. For these "poupets a la mode" there are gorgeous wooden mansions, furnished in a style of supreme luxury, while some of them are provided with a trousseau of corresponding magnificence and even with miniature husbands, correctly attired in black suits, with ties and opera hats. For the small boys there are no cricket bats or footballs, but there are plenty of military accoutrements, imitation decorations or walking-sticks, while whole armies of red-trousered leaden soldiers defend cardboard forts against more truculent forces wearing the spiked helmet of the hereditary foe. A gigantic Christmas tree was organized for the benefit of the refugees of Alsace Lorraine, and many florists laid in a stock of smaller kind of the same prolific shrub. Whatever, therefore, the course of politics, it is very evident that Paris is on the whole determined to celebrate its annual winter festival with the usual compliments of the season.

The Pall Mall Gazette is informed that the Khedive of Egypt has accepted the resignation of Nubar Pasha, his Minister of Foreign Affairs.

A Liverpool company is negotiating with the Marquis of Bute's trustees for the reestablishment of the steamship line between Cardiff, Wales, and New York.

The Orleans Princes have decided not to take seats in the Senate or Chamber of Deputies. The Duke d'Aumale has written a letter declining a nomination for either House.

The Canadian rivers St. Clair and Sydenham are again clear of ice, and several steamers and sailing vessels are making trips. The captains report very little ice in Lake St. Clair.

The French Assembly has decided to maintain martial law in a modified form in all the large cities and towns of the republic.

Marshal Canrobert persists in declining to be a candidate for the French Senate.

The German Ultramontane organ denies that opposition to the Government is abating.

Minister Buffet is disposed to interpret the French Press laws rigorously.

The National Museum of Bucharest has been robbed of its principal treasure, the famous golden hen and chickens. The group—which was of pure gold, profusely adorned with precious stones, and weighed 34 pounds—was of ancient workmanship, and was dug up some years ago at Petrosa. The robbers also carried away the massive golden amphora and pedestal which came from Petrosa. A portion of the broken head of the golden hen was found in the snow, outside the Museum building.

A pamphlet entitled "Poets and Profits," giving an account of the fortunes of Drury Lane Theatre while under Mr. Chatterton's management, has just been published in London. It illustrates fully the precarious nature of theatrical success. "Formosa" brought in a net profit of £10,000, and "The Great City" was a great success. On the other hand, £5,000 were lost with "Marino Faliero," and nearly as much by "Antony and Cleopatra."

A reply has been received at Ottawa from Secretary Fish to the protest sent to Washington by the Dominion Government against the refusal of the United State authorities to allow Canadian vessels to navigate American canals under the terms of the Washington Treaty. The communication acknowledges the receipt of the protest, but gives no intimation what the policy of the American Government will be.

The largest revolving gun that has probably ever been manufactured is now at the Royal gun factories in the Royal Arsenal, Woolwich, England. It is a revolver with five chambers, firing successively through an open-mouth barrel, and moving about on a kind of truck. It weighs 25 cwt., and appears to be very ingeniously contrived. It will shortly be forwarded to Shoeburyness, to undergo a series of trials in competition with various charges of gun cotton.

Monsignor Debs, the Maronite Archbishop of Beyrout, has presented for the new Montmartre Church of Paris a gigantic cedar, described as one of the trees of Lebanon contemporary with those of Solomon and Hiram, which was lately blown down. Twelve fine planks from it, being a sacred number, will soon reach Paris.

The question of making further grants in aid of railways will engage the Provincial Legislature at an early date. To complete all the roads seeking help, projected and in course of construction, would involve an expenditure of between $12,000,000 and $15,000,000, representing a total mileage of 1,115 miles. The applications of the various companies range from $1,500 to $10,000 per mile, the aggregate sum being $3,500,000, or nearly equal to the whole amount originally appropriated in aid of railways by the Legislature of Ontario.

A dispatch from Berlin to the London Post says the German Government is reported to be favorable to the propositions contained in the American circular in relation to Cuba, German commoners being seriously prejudiced by Cuban disorders. German merchants settled in Havana recently presented a memorial to the Reichstag asking for redress through the intervention of Germany. It is reported that the Spanish Minister at Berlin has informed the German Government of the note which Spain has issued in regard to the American proposals.

Prof. Melchiore Peccluuini of Rome, Italy, being unable to find a suitable location for establishing a Masonic colony in Southern California, has departed for the Hawaiian Islands, where he proposes to lease a large tract on one of the islands of the Archipelago.

It is reported that the mission of Rt. Hon. Steven Cane, Paymaster-General, who went to Egypt to inquire into and arrange the financial affairs of the Khedive's Government, has failed. Egyptian securities are depressed.

THE SEASON, CROPS, PRICES, ETC

Harborton, N. J., Jan. 3.—Have had unusually warm, foggy and damp weather during the past week, clearing up warm and pleasant to-day. The year 1875 was not a bad year for farmers in this part of the country as compared with '71-72. We have a heavy crop of corn, good crop buckwheat, average crop oats, good yield of potatoes; wheat not a full crop but very plump grain, and hay nearly average. Prices of produce about the same as in '71-72, and our blacksmiths and other employees have found out that the war is over and do not make their charges a dollar an hour, as they did in '71-72. Prices—New corn, 50c.; oats, 45c.—if bright; wheat, $1.50; hay, $25 per ton; butter, 40c.; pork, 9½@10c. ℔ lb.; eggs, 60c. ℔ score.—D. J. B.

Chapel Hill, N. C., Jan. 3.—This place is, as far as heard from, the most southern extent of the recent earthquake. It was felt, or the rumbling heard, from Alexandria, Va., to this point. Since the earthquake we have had a most extraordinary season of weather. For a week and a half the air has been truly spring-like. For a few days of the time there have been thick clouds and rains. On the fair days people have found it very pleasant without fire throughout the day. Hyacinths and Spiraeas have begun to bloom in the open borders; vines and shrubbery are budding, and persons have enjoyed seats on the open porch. There is a cry of the loss of pork which was slaughtered during the cold days that preceded the great rise in the thermometer. To-day (Jan. 3) the air is coming from the North and there is the prospect of seasonable weather in a few hours.—M. W. A.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Friday, Jan. 8, 1875.

RECEIPTS.—The receipts of Produce for the week were as follows:

Flour, bbls	100,775	Wool, bales	584
Whisky	3,100	Hops, bales	2,600
Corn meal, bbls	2,675	Pork, bbls	9,321
Corn meal, bags	3,525	Cut meats, pkgs	17,300
Wheat, bush	206,000	Lard, pkgs	19,033
Corn, bush	287,000	Tallow, pkgs	1,226
Oats, bush	200,000	Butter, pkgs	22,460
Rye, bush	9,205	Cheese, bxs	13,555
Malt, bush	13,000	Cotton, bales	32,500
Barley, bush	57,500	Rosin	4,832
Beans, bush	8,742	Spts. turp., bbls	348
Grass seed, bags	5,062	Dried Fruits, pkgs	157
Ashes, pkgs	228	Eggs, bbls	6,725
Beef, pkgs	1,416	Beeswax, pkgs	21

BEANS AND PEAS.—Exports of beans past week, 1,725 bbls.; same week last year, 490 do. Exports of peas past week, 14,614 bush.; same week last year, 3,518. The new year opens with a general decline in all classes of beans, and there is an increased demand at the price, chiefly for marrows. Lima beans are very dull at the low figures. The supply is mostly from California, but other growths would sell no better. For Canadian peas there is a fair demand. Green peas dull and again lower. Exports of beans for 1875, 36,900 bbls.; for 1874, 32,100 bbls.

We quote Beans, pea, new, prime, $1.50@1.60; other, 1.25@1.35; medium, new, $1.40@1.45; fair to good, $1.15@1.30; very poor, 60@90c.; marrow, new, prime, $1.70@1.75; other, $1.40@1.60; white kidney, prime, $1.85@1.95; fair to good, $1.60@1.70; red kidney, new, prime, $1.50@1.60; fair to good, $1.40@1.45; California Lima, choice, $3.50@4.00. Peas, Canadian, bbls., new, duty paid, $1.25@1.27; bulk, in bond, $1.02; green, new, ₱ bush., $1.60; Southern B. E., ₱ 2 bush. bag, $3.10@3.15.

BEESWAX.—This market remains quiet but steady at 31½@32c. for Western, and 32@32½c. for Southern; sales of 2,000 bbls. at the latter price.

BROOM CORN.—There is nothing of importance going on, and late quotations are without change; prime lots are scarce, while the lower grades are in abundance.

We quote Brush, short green, 9½@10c.; hurl, green, 10c.; green, medium, 7@8c.; red and red tipped, 6@7c.

BUTTER.—We lack the impetus of seasonable weather for butter to move well. Prices are not quotably changed, but buyers of round lots can mostly obtain concessions in the under grades. The stock of State is reduced to few grades; it is either lower in quality to that which was recently selling at 25c. or up above 28c. There is a large stock of butter to be used up, and a future cheap season is likely to occur. Fine or fancy holds pretty firm, but such grades are running low, and the interior stock cannot largely replace them this season, as the average quality is much below former seasons. Really choice fall butter is hard to find, and we have already drawn heavily upon the earlier packings of our best counties. Western is quiet for solid packed. Rolls easier. Pails are not quotable. They seem to be hurried or carelessly made, in order to use up the surplus of milk the mild season produces in the vicinity. Our quotations are:

State dairies entire, extra, 30@—c.; entire, good to prime, 26@28c.; fair to good, 24@26c.; firkins, selected fresh, 28@30c.; good to prime, 26@28c.; fair to good, 24@25c.; half-firkin tubs, selected, 33@35c.; good to prime, 30@32c.; fair to good, 27@30c.; poor to fair, 25@27c.; State, Welsh, tubs, fall made, 30@31c.; dairies, 27@29c.; good to prime, 25@27c.; fair to good, 24@25c.; poor to fair, 22@23c.; Pennsylvania, store packed, 17@23c.; Western, dairy tubs, selected, 26@27c.; good to prime, 24@26c.; tubs selected fresh, 26@27c.; good to prime, fresh, 23@25c.; fair to good, fresh, 21@23c.; poor to fair, fresh, 20@21c.; Western, early packed, selected, 21@22c.; Western, early packed, other, 16@20c. Roll butter, good to prime, 23@24c.; fair to good, 20@22c.

CHEESE.—Exporters are still doing very little. The sales are at 12@12¼c. for very good to strictly fine, with fancy, 13¼c.—held at 13c.

New State factory, fancy, 13@13¼c.; fine, 12¼c.; do. good to prime, 11¼@12¼c.; fair to good, 10@11¼c.; poor to fair, 7@10c. State Farm Dairy—fancy, 12@12¼c.; good to prime, 10¼@11¼c.; fair to good, 10¼c. Western factory, cheddar, fine, 12@12¼c.; good to prime, 11@12c.; flat fine, 12½@13c.; good to prime, 11@12c.; fair, 8@11c.; poor to fair, 6@8c.; English dairy, Connecticut, 12@13¼c.; do. State, 17@20c.; pineapple, 16@18c.

COTTON.—Export purchases are larger and spinning demand fair, with prices steady. Quotations as follows:

January, 13¼c.; February, 13 5-16@13 11-32c.; March, 13 9-16@13 19-32c.; April, 13 13-16c@13 25-32c.; May, 14@14 1-32c.; June, 14 3-16@14 7-32c.; July, 14 11-32@14¾c.; August, 14 7-16@14 15-32c.

Quotations for spot cotton, based on American standard of classification:

	Uplands.	*Ala.*	*Orleans.*	*Texas*
Ordinary	10¼	10¼	10¼	10¼
Strict ordinary	10 15-16	10 15-16	10 15-16	10 15-16

Stained.

Good ordinary	10¼	Low middling	12
Strict ordinary	11¾	Middling	12¾

DRIED FRUITS.—There is a little more life to the jobbing trades, with prices more regular; demand chiefly for prime grades of apples.

Apples—State, sliced, 10@10¼c.; quarters, 9¼@9¾c.; Western quarters, 8¾@9c.; southern sliced, 1875 crop, 9¼@10c. for prime, and fancy 12c.; Tennessee quarters, 8@8¼c. Blackberries, new, 11@12c. Peeled peaches, good and prime Georgia, 14@16c.; do. fancy, 18c. Unpeeled peaches, new, 12¾@13c. for halves, and 11¼c. for quarters. Plums, 20c. Raspberries, 25@30c. Cherries, 24@25c. Evaporated (or new style dried) peaches are quoted at 22@25c. for peeled and 13c. for unpeeled halves.

EGGS.—The arrivals are liberal for the season, and with a good supply in store holders and sellers are not generally firm. A few prime straight lots of fresh Western are quoted at 30c. Limed are running out. We quote:

Jersey and Pennsylvania, single bbls., ₱ doz., 31@32c.; State, 29@30c.; Western, prime, 28c.; do. fair marks, 28@28½c.; Canadian, 28½@29c.; Southern, 28@29c.; Limed, State, prime, 25@27c.; do. Western, good to prime 24@26c.

ESSENTIAL OILS.—The bulk of the crop still remains in first hands. Small parcels of peppermint a shade above.

We quote peppermint in glass "H. G." $4.25 ₱ lb., cans, ₱ lb., $4. Wintergreen, $3.25 ₱ lb.; sassafras, 65c.; spearmint, $3; pennyroyal, $2; wormwood, $4; tansy, $4.

FEATHERS.—With an improved supply, prices are easier at 60c. for prime live Western geese and 35c. for mixed. Common poultry feathers not inquired for.

FLOUR AND MEAL.—The flour market ruled heavy. Medium and good grades dull. City Mill flour was shaded and sold to a fair extent, in part for the West Indies. We quote:

Superfine State, $4.25@4.65; extra do., $4.90@5.90; superfine Western, $4.25@4.65; extra do., $4.90@5.90; No. 2, $3.00@4.00; extra round-hoop Ohio, $4.25@5.30; trade brands do., $5.35@7.40; white wheat extras, $5.95@7.00; St. Louis, $5.50@9.00; City Mills extra, $5.00@6.00; Southern at $4.15@4.00 for superfine; $4.80@6.30 for poor to choice shipping extras; $7.25@8.50 for trade and family brands. Rye flour at $4.25@5.40, the latter an extreme. Buckwheat plenty and dull at $2@2.35 ₱ 100 lbs. Corn meal dull at $3@3.25 for yellow Western, $3.10@3.20 for Jersey and Pennsylvania, and $3.85 for Brandywine. Bag meal was dull at $1.10@1.65 ₱ 100 lbs.

FOREIGN DRIED FRUITS.—Layer raisins, $2.65; Muscatel, $2.90@3.15. Currants, new, 7¾c. Tarragona almonds, 17¾c. Sardines, 13¾@14c. Valencia raisins, 10¾c. Turkey prunes, 5¾c.

FRESH FRUITS.—Greenings have scalded some during the late warm spell. Spitzenbergs are turning out well. Sales moderate, and likely to be until the effect of the soft weather is disclosed. The demand for Lady Apples is over; $6@7 per bbl. now extreme for good lots. The stock has been pretty well culled for the holidays. California pears will be not in stock until we can reach Eastern Bourre. Cranberries have a good sale. Grapes not wanted. Peanuts steady, though liberal receipts do not help a late advance.

Apples.—Spitzenbergs and Baldwins, fine, $3.50@4; Greenings, $3@3.50; mixed, good, $2.50@2.75; do. fair, $2@2.25. Pears—Choice Cal., ₱ box, $4@4.50. Cranberries—Jersey, choice, bush. crates, full measure, $3@3.25; good to prime, $2.75@3; good to choice, ₱ bbl., $8.75@9.75; Cape Cod, fancy, ₱ bbl., $9.75@10.25; Eastern, fancy, $9.75@10.25; good to prime, $8.50@9.50. Nuts—Peanuts, Virginia, $1.40@1.60; do. Wilmington, $1.70@1.85; do. Tennessee, 75@90c.; Hickory nuts, $1@1.25.

FURS AND SKINS.—Generally quiet, except for hatters' stock. We quote:

Bear, Northern, as to size and quality	$10 00 to 15 00
Bear, Southern and Northern yearlings	5 00 to 10 00
Beaver, Northern, per skin	2 50 to 3 50
Beaver, Western and Southern	1 50 to 2 50
Badger	20 to 50
Cat, Wild, North and East States, cased	50 to 60
Cat, Wild, Southern and Western	40 to 50
Fisher, Northern and Eastern	7 00 to 12 00
Fisher, Southern and Western	3 00 to 8 00
Fox, silver	15 00 to 30 00
Fox, Cross, Northern and Eastern, according to size and color	3 00 to 5 00
Fox, Red, Northern and Eastern, according to size and color	1 50 to 1 85
Fox, Red, S. Penn., N. J., and N. Ohio	1 25 to 1 50
Fox, Red, Southern and Western	75 to 1 00
Fox, Gray, North and Eastern, cased	75 to 1 00
Fox, Gray, South and West	40 to 60
Fox, Kitt	30 to 50
Lynx	1 00 to 2 00
Marten, Stones	1 50 to 2 00
Mink, New York and New England	3 00 to 4 00
Mink, Can., Mich., and Minn	2 00 to 3 00
Mink, New Jersey, Pennsylvania, and Ohio	1 00 to 1 50
Mink, Maryland, Virginia, Kentucky, Indiana, Wisconsin and Iowa	75 to 1 25
Missouri and all Southern	50 to 75
Muskrat, N. and East'n, fall & winter	28 to 25
Muskrat, West, including Penn. and Ohio, winter	20 to 28
Muskrat, Southern prime winter and fall	12 to 15
Otter, North'n and Eastern and North-West	10 00 to 12 00
Otter, Penn., N. J., Ohio and Western	8 00 to 10 00
Otter, South Carolina and Georgia	2 00 to 6 00
Opossum, North, cased	18 to 20
Opossum, South and open North	12 to 15
Racoon, Mich., N. Ind., N. Ohio, Indiana handled, dark	80 to 1 00
Racoon, Ill., Iowa, Wis. and Minn	50 to 65
Racoon, N. Y. and E. States & N. Penn.	65 to 75
Racoon, N. J., S. Penn., Ind., Ill., Mo., Neb. and Kan	40 to 50
Racoon, Md., Va., Ky., Tenn., N. and S. Car., Geo., Ark., Fla. and Ala	15 to 40
Rabbits, prime, cased	2 00 to 3 00
Skunks, prime black, No. 1, cased	— to 1 30
Skunks, prime black, No. 1, open	— to 1 00
Skunks, prime one-half white streak	50 to 80
Skunks, whole streaked	15 to 20
Wolf Skins, mountain, large	2 00 to 3 00
Wolf Skins, prairie, prime	75 to 1 25

GRAIN.—Wheat has been comparatively steadily held, notwithstanding large supplies and slow export trade. Latest sales at $1.21@1.23 for prime to very choice No. 2 Milwaukee spring in store; $1.34 for very choice hard Minnesota spring afloat for milling; $1.08@1.09 for No. 3 Milwaukee spring; 93@93c. for rejected spring; $1.01@1.04 for "no grade" red Western; $1.20@1.23 for No. 2 Spring; $1.04@1.15 for winter red and amber; $1.32@1.50 for white, and $1.30@1.34 for No. 1 spring. Rye at 95@96c. for State and 88@90c. for Western. Barley at $1.18@1.20 for No. 2 Canada, and $1.25@1.27 for No. 2 Bay. Corn is active and strong; sales at 66½@66¾c. for new mixed Western; 69c. for high mixed; 67@68 for yellow; 64@65c. for yellow Southern. Oats are strong and fairly active; latest sales at 47@48c. for white Western; 47@48c. for mixed State, and 47@47½c. for prime mixed Chicago.

HAY AND STRAW.—There is only a moderate business being effected in any description, but previous prices are unchanged.

Bale hay is quoted:—Shipping, 70@80c.; retail qualities, $1.05@1.15; clover, 65@80c.; salt, 60@70c. Straw is quoted at $1.05@1.20 for long rye; 70@90c. for short rye; 70@80c. for oat.

HIGHWINES are selling at $1.11½@1.12.

HONEY—Has declined when it ought to be advancing. Market very dull, and the cheap quotations that have ruled are a good indication of the inability of the masses to use luxuries this season. We quote:

White clover, in glass boxes, ₱ lb, 18@22c.; buckwheat, 10@18c.; strained, 10@12c.

HOPS.—There is a pretty steady tone to this market, and not a little is being done for export; the late cables report an advance, and shippers are taking advantage of this favorable turn. Home brewers are still quiet, as most of their contracts are now falling due. We quote:

New York State, 11@15c.; Eastern, 11@15c.; Wisconsins, 11@15c.; Yearlings, 8@10c.; Olds, all growths, 4@7c.; Californians, 15@21c.

LEATHER.—Hemlock, sole, 23@25c. for light; do. middle, 25@27c.; do. heavy, 25@27½c.; good damaged, 21@23½c.

POULTRY AND GAME.—Prime dressed poultry have at last reached something like paying prices. Fancy dry picked are quoted 1@2c. higher than our annexed rates. Western stock runs poor; much of it has been in the way during the warm spell, and the importation of all Western is more or less damaged. We quote:

Turkeys, N. J., choice, 17@19c.; do. other, 16@18c.; State and Western, choice, 15@17c.; do. other, 7@13c. Chickens, N. J., 17@19c.; State, as to quality, 16@18c.; Western, 15@17c.; Bucks Co., 19@20c. Ducks, N. J., good to prime, 18@20c.; State, do., 16@18c.; Western, do., 15@17c.; fair to good, 13@15c.; poor, 8@12c. Geese, N. J., prime, 13@15c.; State, good to prime, 10@12c.; Western, do., 9@11c.; do, poor to fair, 7@8c.

Live poultry has sold unusually well for the season. Killers have been several times called upon to supply immediate wants of fresh dressed. We quote:

Fowls, Jersey, 13@15c.; Western, 12@13c. Chickens, 10@11c. Roosters, 6@9c. Turkeys, Jersey, 14@16c.; Western, 12@14c. Ducks, Jersey, ₱ pair, 87c.@$1.25; Western, 55@70c.; Jersey, $2@2.50; Western, $1.25@1.62.

The game market is still in a very unsettled condition, owing to the softening effect of the warm spell. A good deal of venison arrives spoiled, or spoils soon after arrival. We quote the following rates for sound stock:

Quail, trapped, prime, ₱ doz., $2.00@2.25; soft, 75c.@$1.50. Grouse, prime, ₱ pair, 80@90c.; drawn, 35@45c. Partridges, choice, ₱ pair, 60@70c.; Western, drawn, 50c.; Eastern, 40@50c. Hares, ₱ pair, 15@30c. Rabbits, ₱ pair, 20@30c. Venison, short saddles, ₱ lb., 9@10c.; long saddles, 7@9c.; whole deer, 5@6c.

PROVISIONS.—The general markets are steady. Quotations are for mess pork, $20.75@21; for January, $20.80.; extra prime, $15; prime mess, $19.50. Dressed hogs at 8¼@8c. for Western. Dry salted shoulders 9¾c. Bacon at 10¾c. for long clear, 11c. for short clear. Lard at 12¾c. for spot, December and January, 13 1-16c. for February, 13 3-16 for March. Tallow at 9¾@10c. for prime. Stearine at 13¾c. for Western. Beef hams, $21.50@22.50. Beef, extra mess, $12@12.50; do., plain mess $11@11.50; new tierced at $23 for prime mess, $25 for India mess. City extra India mess, $29.00@30.00. Old extra mess, $12, and $10@12 for plain mess; packet, $16@17.

SALT.—Ashton's, $2.50 ₱ sack; Higgins and Dean's, $1.70; Denkin's, $1.55@1.65; Worthington's, Marshall's and Washington's, $1.60@1.65.

SEED.—Clover quiet and rather weak at 12¾@12¾c. for Western, and 13@13¾c.

SUGAR.—Market steady with a fair inquiry. Powdered and granulated, 10@10¾c.; crushed, 10¾c.; soft yellow, 8¾c.; "A," 10@10¾c. for State.

SUNDRIES.—Cider in small pkgs. $22@25; in casks, $18@20; old papers, 1@1¼c.; country rags, free of wool, 3@3½c.; hoops, 14 feet, 38@40c.; do. 12 feet, 32c.

TOBACCO.—There has been a moderate demand for seedleaf at about steady prices. Kentucky quiet, but steady.

KENTUCKY LEAF.	Light. Cents.	Heavy. Cents.
Common lugs	6 @ 8	7¾@ 8¾
Good lugs	7 @ 8	8¾@ 9

VEGETABLES.—Exports of potatoes past week 400 bbls.; of onions 300 do. The supply of potatoes is still far above the wants of trade, and there is little chance of later sales, making an improved average.

Early Rose, bulk, ₱ bbl., $1.00@1.25; Peach Blows, $1.50@1.75; Prince Alberts, $1.00@1.25; Peerless, 65c.@$1.00. Sweet potatoes, $1@2.75. Cabbages, ₱ 100, $3@5; red, $6@10. Cauliflower, bbl., $2@5. Squash, Marrow, bbl., 40@60c.; Hubbard, $1.25@1.50. Onions, red, bbl., $1@1.50; yellow, $1.50@1.75; white, $2.50@2.75. Russia Turnips, ₱ bbl., 75c.; white, 60c. Carrots, $1.00.

WOOL.—Only a moderate trade has been effected in this staple, as manufacturers are not disposed to pay present rates, and holders, being backed by light stocks, are unwilling to grant concessions. We give quotations as follows:

ROCHESTER, Jan. 6.—Flour market steady; spring, $5.75; amber winter, $7.00; white winter, $7.25; double extra, $7.50. Rye flour quiet at $5.50. Wheat is dull; Milwaukee club, $1.25@1.30; amber winter, $1.15@1.20; white winter, $1.20@1.30. Oats, nominal at 35@45c. Corn steady at 70@75c. Corn meal, $1.50@1.75. Butter, 25@28c. Cheese, 12@13c. Eggs, 26@28c. Lard, 13@14c. Apples, ₱ bu., 50@85c. Potatoes, ₱ bu., 25@35c. Beans, ₱ bu., 85c.@1.20. Mess pork, $21@—. Wool, 30@35c. Hay, $10@15. Straw, $8@12. Timothy seed, $2.75@—; clover, $5.75@6.00. Wood, hard, ₱ cord, $8@9. Coal, $6.95@7.35 for stove.

COUNTRY CHEESE MARKET.

LITTLE FALLS, N. Y., Jan. 9, 1876.

THERE is no material change to note in the market this week. There has been a little more inquiry for fine cheese, but prices on late ends, both for farm and factory, remain about the same as last week. Farm dairy cheese is composed of "odds and ends," and sales are made at prices ranging at 6@9c., according to quality. The lower grades are hard to move, and buyers show but little disposition to handle them even at low prices. The "fancy cheese" of our best factories is not on the market, as the views of holders are above those of buyers. The price on such lots range at 13¾@14c., and the quantity back is comparatively light.

The "late ends" of factories now ready for shipment may be quoted at 9¾@10¾c., with exceptional lots going a shade higher. There are several factories holding considerable lots of into-made cheese which will not be put upon the market at present.

Winter butter is coming forward and sells at about 25c. for fair to good lots.

The weather has been warm and the snow during the early part of the week was not sufficient for sleighs to run on the country roads leading to this market.

We begin to hear of serious trouble in the herds on account of abortion. In other respects, stock of all kinds appear to be wintering well.

We have advices from Europe up to the 23d of December. Our London correspondent says:

The finest English Cheddar cheese is scarce and is sought after. Faultless American is undoubtedly scarce. Good medium and low grades compose the stock in market and sales have been good.

American, extra, 95@98s.; fine, 88@94s.; good, 56@60s.; secondary, 21@48s. The other descriptions of cheese sell as below:—English cheddar, 79@98s.; Wiltshire double, 68@80s.; Cheshire medium, 56@88s.; fine, 76@90s.; Scotch, 70@78s. Dutch cheese—Edams, 70s. ₱ cwt.

Fine butter is very scarce, and transactions in all sorts have been good. The market is firm. Quotations are as follows:

Cloonmels, 140@148s.; Corks, 118s.; Dorsets, 103s.; Normandy, 110@160s.; Swedish, 100s.; American and Canadian, 80@120s., ₱ cwt.

Oleomargarine or artificial butter brings 70@84s. ₱ cwt.

LIVE STOCK MARKETS.

NEW YORK, Jan. 8, 1876.

RECEIPTS OF LIVE STOCK.

	Beeves.	Cows.	Calves.	Sheep & Lambs.	Hogs.
Sixtieth St.	3,123	33	316	2,474	000

" last week	6,795	34	749	20,011	24,352

BEEVES.—On last Monday forenoon trade opened slow on a moderate run of horned cattle, falling off a ¼c. on the closing quotations of the past week. The quality generally was fair. Prices were 8¾@13¾c. ₱ lb.; weights, 4¼@11 cwt. Wednesday, trade moderate, with all of the herds to hand sold off at noon; prices, 7¾@13c. ₱ lb.; weights, scant 5@10 cwt. Thursday, sales fair at 8@12¾c.; weights, 5¼@7¼ cwt. Friday, the markets closed dull at 8¾@12¾c.; weights, 5@8 cwt. From 55@58 lbs., not, have been allowed to the cwt. Spanish herds direct from the Plains sold at 7@8¾c. ₱ lb.; do., corn-fed, 9@9¼c. Native steers, 8@12¾c.; grade do., 12¾@13¾c. Oxen, 8@13c.; Dry cows, 9c. Heifers, 10c. Mixed herds, 8@11c. Bulls, live weight, 4@4¾c.

COMPARATIVE RATES.

Quality.	This week. Cents.	Last week. Cents.
Good	12 @13¾	12 @13¾
Fair	11 @11¾	11 @11¾
Poor	10 @10¾	10 @10¾
Poorest	7 @ 9¾	6 @ 9¾
Gen. selling rates	9¾@11	9¾@10¾

MILCH COWS.—Trade so small as to render quotations of little value, save to dealers. Three cows sold at $55@67.00 ₱ head; 2 do., $60@75; 5 do., $50@75; 3 do., 70@82—calves always included.

VEALS AND CALVES.—Smooth quality veals nominal at 8@10¾c. ₱ lb. Grass calves slow of sale at 4@5c. ₱ lb., also at $6@9.50 ₱ head.

SHEEP AND LAMBS.—Sheep slow of sale, even in the selected lots. Lambs have not been quoted. Monday sheep sold at 5@6¾c. ₱ lb. Wednesday, 4¾@7¾c. Thursday, 6¾@7¾c.; Friday, the markets closed dull at 6¾@7¾c. Iowa sheep sold at 5c. ₱ lb.; Colorado do., 5¾c.; State do., 4¾@6¾c.; Michigan do., 4¾@5¾c.; Kentucky do., 5¾@6¾c.; Illinois do., 5@6¾c.; Canada do., 6@7c.

HOGS.—Two car loads of Ohio hogs, live weight, sold at $7.70@8 ₱ cwt. City dressed remain inactive on a light run and with high rates of sale. Monday, 8¾@9¾c.; Wednesday, 9¾@11c.; Thursday, 10¾@11c. Friday trade closed dull at 10¾@11c. ₱ cwt. Western dressed slow of sale at 8¾@9¾c. ₱ lb.

HORSE MARKET.—City trade still dull and small. The only branch of the horse trade which manifests any activity is that of the sale of heavy draught horses, nine head of which sold at $275@400 ₱ head, including one pair choice quality at $575; one pair family carriage horses, $400; one pair stylish do., $1,000; thirteen head, poor quality, light harness horses, $19@70 ₱ head; ten ordinary quality, do., $95@150 ₱ head; one saddle horse, thoroughbred, choice quality, $300; three ponies, for harness use, $200@215 ₱ head; one trotter, moderate action, $250. Fifteen horses arrived ₱ Erie Railroad, via, Oak Cliff Station.

MOORE'S RURAL NEW-YORKER is an excellent Agricultural paper, and very popular. As a family visitant it is hard to beat in the attractions it holds forth for young and old. We are pleased to see that Mr. MOORE is full of his old enterprise and bent on making the paper better and better from year to year.—*Yates Co. Chronicle.*

PERSONAL ITEMS.

GEORGE WILKES has gone to Europe.

GEN. MCCLELLAN is living in Baltimore.

SIR ANTHONY ROTHSCHILD of London, is dead.

SERVIR PASHA it is said had been recalled from Herzegovina.

MR. MAX MULLER has been offered a professorship in Florence.

MR. MAURICE DALY of New York, is staying in Jacksonville, Fla.

MRS. DAVID DUDLEY FIELD is said to be suffering from severe illness.

COL. W. H. CHEESEBROUGH and Mrs. Cheesebrough have returned to Europe.

THE Rev. Mr. Moody is opposed to dedicating church edifices till they are paid for.

GOV. H. LUDDINGTON and other Wisconsin officers were inaugurated at Madison, Jan. 3.

M. ONTHEY, French Minister plentpotentiary, has gone to Egypt on a special mission.

Bishop HAVEN is in New Orleans, and will remain there during the present month.

JAMES ANTHONY, late of the Sacramento Union, died in san Francisco, Jan. 4 of apoplexy.

ARCHDUKE RUDOLPHE, Prince Imperial of Austria, will be crowned King of Hungary in July.

THE King and Queen of Greece will make a tour in the spring to study the Eastern question.

PROF. MARSH has secured 2,500 volumes of Japanese literature for the library of Yale College.

THE Hon. Alex. H. Stephens was improving daily at last accounts, but was still very sick and weak.

THE NEXT edition of Mr. Tennyson's works is to be annotated with explanations of all the obscure passages.

THE Rev. D. N. Bentley of Norwich, Conn., officiated recently at the marriage of his great-granddaughter.

CAPT. S. P. CHILD, formerly a sea captain in the East India trade, died in Warren, R. I., Jan. 5th, aged 97 years.

COL. T. B. MILLS offers to pay the expenses of sending a regiment of Arkansas State Guards to the Centennial.

COL. S. A. STOCKDALE, a member of Grant's staff in the latter part of the war, died Christmas, at San Diego, California.

THE total income of the Prince of Wales, from all sources, is about $575,000. The Princess receives, besides $50,000.

BISHOP JEREMYN, late of Colombo, has been unanimously elected to succeed the late Bishop Forbes in the diocese of Buchin.

MR. CARLYLE expresses himself as greatly pleased by the address and medal presented to him on his 80th birthday.

EXCURSION trains run on three roads to accomodate people from other towns anxious to hear Tilton lecture in Hartford.

S. F. LYMAN, who has for twenty-seven years been Judge of the Probate Court at Northampton, Mass., died Jan. 3, aged 75 years.

THE Senators Wm. Windom of Minnesota, J. R. West of Louisiana, and James E. English of Connecticut, were in this city, Jan. 5th.

MISS M. H. DAVIS, daughter of Jefferson Davis, was married at Memphis recently, to J. Addison Hayes, cashier of the State National Bank.

ALDERMAN STONE, ex-lord Mayor of London, has received the rank and decoration of the French legion of honor from President MacMahon.

GEN. B. F. BUTLER is to deliver the Fourth of July oration at Lowell, Mass. This is the first piece of news from the Essex statesman for a long time.

PROF. B. L. GILDERSLEEVE of the University of Virginia, has accepted the chair of Greek in the Johns Hopkins University at Baltimore, at a salary of $5,000 a year.

THE Rev. Dong Gong is the Chinese preacher who recently went from San Francisco to Portland, Oregon. Already he has baptized twelve Chinese converts there.

EX-SPEAKER BLAINE has been spending the New Year's season with his relatives in Carlisle, a town with which his family was identified from its foundation 150 years ago.

JUDGE PETER GANSEVOORT died at Albany, Jan. 3. He was one of the oldest and most eminent citizens of that city, and was a son of Gen. Peter Gansevoort of Revolutionary fame.

MR. JAMES MASON of this city, has won the chess match with Mr. Bird, the English player, thus gaining the purse of $100 subscribed by the members of the New York Down-Town Chess Club.

MAYOR COBB calls the attention of Bostonians, in his annual message, to the Centennial of the Evacuation of Boston by the British on March 17 next, and suggests a suitable municipal celebration of it.

MR. J. M. SEARS, the Yale student who is heir to a $9,000,000 estate in Boston, cannot come into full control of the property until he is 40 years of age. Till that time he will have an income of $10,000 a year.

MISS JULIA J. THOMAS of Cornell, carried off the Greek prize in the Intercollegiate contest; before she could take it she got married and it went to somebody else. Why? Because, accusatively speaking, Greek is all *gamon* to her now.

GOV. TILDEN is said to have accepted an invitation to act as presiding officer of the Infant Asylum Ball at the Academy of Music, and Mr. John Bigelow will be the Vice-President. The arrangements are in charge of Mr. Theodore Moss of Wallack's Theater.

Stock and Poultry.

IMPORTANT TO FARMERS,
CATTLE RAISERS AND DEALERS!

A peculiar disease, as I term it, is the Grub in the Tongue. This disease is very little known, although found more or less among cattle throughout the country. A small grub sticks through the tongue, appearing on the upper part or edge underneath. These grubs are seen in different forms; at times white, at others red or black. They make cattle unhealthy, and some cases prove fatal. Cattle with this disease are hard to winter, and do not fatten or thrive. When the grub makes the tongue raw and sore, it prevents them from chewing their food and from drinking, especially when the weather is cold, as the pain is then too great for them to either eat or drink. I have doctored cattle in my own neighborhood for this disease, for fifteen or sixteen years, and can cure it in fifteen minutes, so that the animal will eat and drink with ease. I visited a herd in Clay Co., Iowa, in the spring of 1874, that were dying off fast with this disease. I doctored them at once, curing the worst cases in a single night. Every farmer should attend to his cattle in the fall or commencement of winter, as they will winter better on much less food, and come out in the spring in good condition. I will send full directions for the cure of this disease on receipt of One Dollar, sent in Registered Letter. Address (writing town and county in a plain hand,) PETER SHAW, Sibley, Osceola County, Iowa.

NEWS CONDENSER.

— France supports 1,500 dramatic authors.

— Russia advises Montenegro to remain neutral.

— Fishing is good on Oneida lake, near North Bay.

— The winter term of Hamilton College opened Jan. 7.

— Dividends paid in Hartford, last year, aggregates $10,343,409.

— The American Rifle Club has decided to build a club-house at Creedmoor.

— There are 11,333 blind men and 8,977 blind women in the United States.

— The Republican candidates were assured great popular support in Paris.

— Gregg is the only county in Texas out of debt and with money in her treasury.

— The people of western Georgia are still emigrating to Texas in large numbers.

— The Evening Republic is a new daily published by the Courier Company of Buffalo.

— A conspiracy has been discovered in Servia to dethrone Prince Milan, so says rumor.

— The Irish Home Rule members of Parliament held a conference in Dublin, last week.

— An attempt is being made at Brunswick, N. C., to raise Angora goats for their wool.

— A large number of Scandinavians have colonized near Falls City, Washington Territory.

— A saving of $190,000 is possible from the disbanding of the several New York regiments.

— Since 1865 the State of Alabama has bought, at tax sales, no less than 4,800,000 acres of land.

— Of the Mayors of the incorporated cities of this state, 14 are Democrats and 9 Republicans.

— The money order business of the New York post-office in 1875, amounted to about $31,000,000.

— The boat-houses of the amateur oarsmen on the Harlem River have a lonely look at this season.

— The Third Presbyterian Sunday school, Albany, celebrated its fifty-third anniversary Sunday.

— The West Presbyterian Church, Binghamton, has paid an indebtedness of $16,000 during the past year.

— A new hospital has been opened at Springfield, Ill., by a party of Sisters of Charity expelled from Germany.

— Nine jurors in a panel of twelve will be permitted to return a verdict according to the new Constitution of Texas.

— It has been decided to begin the Channel tunnel at St. Margaret's, near Dover, next April, by opening a trial cutting.

— The report of the English Committee on reorganizing the Erie Railway recommends giving control to the bondholders.

— The School Committee has again defeated the proposition to abolish corporal punishment in the public schools of Boston.

— In Philadelphia all owners of clipped horses which are not properly blanketed in the streets are to be arrested for cruelty to animals.

— On the 5th inst. the laboring men of Albany paraded with the motto, "Bread or Work," and waited on the Mayor, asking employment.

— Besides furnishing all the material, the Government will be obliged to pay $1,000,000 for the rebuilding of the Monadnock, at San Francisco.

— Vanderbilt University at Nashville, now has 200 students in its medical department, 150 in the literary, 40 in the theological, and 20 in the law.

— The hotels of Washington are crowded with the baggage of disappointed office seekers who didn't have enough money left to pay their bills.

— During 1875, there were built in the Boston District, 2 ships, 6 barks, 3 schooners, 1 barkentine, 1 steamer, and 8 other vessels, with a total tonnage of 8,439 51-100.

— A quarterly dividend of two and one-half per cent. will be paid by the Delaware, Lackawanna & Western Railroad Company on and after Jan. 20. Transfer books closed recently.

— A woman at New Haven recently bought, at an auction sale, for a few cents, a $1,500 India shawl, which had accidentally got among some articles sent to the auction room.

— A despatch from San Diego says that the entire Mexican population was implicated in the recent raid on Campo and would have shared the spoils had the raid been successful.

— The subscribers to the new music hall in Cincinnati have organized with Mr. Joseph Longworth for President, Mr. Julius Dexter, Secretary, and Mr. Reuben R. Springer, Treasurer.

— A Tennessee court has just decided that a teacher has the same right to enforce obedience from a child that a parent has, and can therefore inflict corporal punishment when necessary.

— The total exports from this port to the Republic of Hayti in 1875 were $1,881,514. This is nearly $1,500,000 in excess of the previous year, while the imports show an increase of over $750,000.

— During the quarter ending Dec. 31, 1875, postage stamps of the value of $789,905.50 were sold at the Post-Office in this city. This exceeds by $30,000 the sale of stamps during any previous quarter.

— The California Senate has passed a bill for the destruction of the seals in the harbor of San Francisco on the representation of the Fish Commissioners that they kill the small fry and prevent the increase of fish in its waters.

— The National Republican Convention of 1856 was held at Philadelphia; that of 1860, at Chicago; that of 1864, at Baltimore; that of 1868, at Chicago, and that of 1872 at Philadelphia. The West feels itself entitled to the next one.

Real Estate.

1876. WHERE NOW? 1876.

To MICHIGAN, one of the foremost, flourishing and healthy States!

WHAT FOR?

To buy a FARM out of the

One Million Acres

of fine farming lands for sale by the GRAND RAPIDS & INDIANA R. R.

Strong Soils. Ready Markets. Sure Crops. Good Schools. R. R. runs through center of grant. Settlements all along. All kinds of Products raised. Plenty of water, timber and building materials. Price from $1 to $10 per acre; one-fourth down, balance on time.

☞ Send for illustrated pamphlet, full of facts and figures, and be convinced. Address

W. A. HOWARD, Comm'r,
Grand Rapids, Mich.

P. R. L. PEIRCE, Sec'y Land Dep't.

Wit and Humor.

THE cent we are looking for—Centennial.

A BARBER-OUS procedure—Taking Time by the fore-lock.

A good wife is a good thing, but a bad husband beats her.

WHEN is love like a battle?—When it comes to an engagement.

A GOOD temperance work—Removing the bars at the mouth of the Mississippi.

How does man differ from the brute creation? He stands upright, but he doesn't act so.

IT is all well enough to say, "Take things as they come," but suppose they don't come?

JONES, in writing to a friend, says that he is glad to see that his wife is recovering very slowly.

QUERY from the studios.—When a man marries a lady artist, ought he to become a model husband?

THE Cincinnati elephant that swallowed two gallons of whisky at one gulp says that he took it for "a cold."

THE person who composed "O, for a Thousand Tongues!" passed most of his boyhood in molasses hogsheads on the wharf.

WHEN Freedom, from her mountain hight,
Unfurled her standard to the air,
Her skirts, pinned back so very tight,
Made her appear exceedingly fair.

IN St. Louis everybody is considerate, and therefore a daily paper remarks:—"Two gentlemen and a lady left for the Penitentiary last week."

A YOUNG lady asked a book-store clerk the other day, if he had "Festus." "No," replied the clerk, "but I'm afraid a boil is coming on the back of my neck."

IT is said that some people have what is called "spontaneity," and some haven't; but nobody ever sat down on a pin-cushion yet without manifesting something surprisingly like it.

"You here again, sir?" remarked the magistrate. "'Scuze me ju'ge," replied the victim, "I've been vazzinat'd four (hic), five times, an' juz I spoz'd, 's too much, 's too much."

PRINTED signs of "Heaven is Our Home," may be hung in every room in the house, yet a man will speak up promptly and emphatically when he can't find the boot-jack.

GRANDFATHER to his hopeful—"My son, which would you rather have when you get home, a little brother or a little sister?" Grandson—"Well, I would rather have a little pony."

IT is hard to keep track of the sermon when you sit in the back part of the church, but then you get out first and have the best chance to select a good umbrella from the pile at the door.

"HAVE you any nice fresh farmer's eggs?" inquired a precise old lady at a grocery store. "No, ma'am," replied the practical clerk, "but we have some very good hen's eggs." She took three to try.

A NEW sect has appeared in Kansas. They hold it a sin to kill a bug, or for a young lady to let any one put his arm around her. As for the bugs—good. As for the young lady—well, better.

A FRENCHMAN thinks the English language is very tough. "Dere is look out," he says, "which is to put out your head and see; and look out which is to haul in your head and not for to see—just contrarie."

"No George," she said, in response to his question, "It is not true that a string of new belt buckles in a shop window would make any woman lose a train, but," she added, amusingly, "sometimes she might have to run a little."

JOHN HENRY had a guest to dinner, the other day, and during a pause in the conversation the infant terrible spoke up:—"I wish I was you." "Do you little boy; and why do you wish you were me?" 'Cos you don't get your ear pinched when you eat vittles with your knife."

PAT had been engaged to kill a turtle for a neighbor, and proceeded immediately to cut off its head, Pat's attention was called to the fact that the turtle still crawled about, though it had been decapitated, and he explained:—"Sure the baste is entirely dead, only he is not yet conscious of it."

"Only a lock of golden hair,"
The lover wrote:—"Perchance to-night
It formeth on my pillow fair
A halo bright."
"Only a lock of golden hair,"
The maiden, smiling, sweetly said,
And she laid it over the back of a chair
And went to bed.

THUS does the unregenerate Salt Lake Tribune scoff at the saints:—"The other day the One-Eyed Pirate of the Wasatch sauntered up to the counter in the provisions department of the Co-op, and, noticing the oval butter scales with the hand pointing to the figure 12, pulled out his watch and set it accordingly. The pirate's watch now keeps butter time than any ticker in town.

DEAR! DEAR! DEAR!

Ancient Maiden—"What is the price of beef to-day, Mr. FROST?"
Butcher—"Fifteen pence a pound, Miss."
Ancient Maiden—"Fifteen pence a pound! Why you *are* a dear butcher!"
Butcher—"Why—eh—yes—thank you, Miss, that's just what Mrs. FROST used to say before I married her!"

NOW IS THE TIME

Consumers Importing Tea Co.,
No. 8 Church Street,
P. O. Box 5,509. New York City.

This is a combination of capitalists to supply the consumers of Teas throughout the United States on the mutual principle.

We have experienced agents in all the best districts of China and Japan to select Teas especially for our trade.

We expect every consumer of Teas to render us all the assistance they can in carrying out our enterprise, as we make a specialty of SUPPLYING CONSUMERS ONLY (and allow no middlemen to make any profit on our importations), which will enable us to supply them with Teas at prices lower than have ever been known, and of those fine qualities that seldom reach the interior, being sold only to the large cities and among the very wealthy.

Hoping the consumer will take an interest in our enterprise, and send at once for a circular with full explanations of how to proceed to obtain our goods, we remain,

Most respectfully yours,
Consumers Importing Tea Co.,
No. 8 Church St.,
P. O. Box 5,509. New York City.

Entered, according to Act of Congress, in January, 1874, by the Consumers Importing Tea Co., in the Office of the Librarian of Congress, Washington, D.C.

THE PALACE HOTEL TRAIN
BETWEEN
NEW YORK AND CHICAGO,
via Cleveland.

Leaves Erie Railway Depot, foot of Chambers St. New York:

9:00 A. M., Daily except Sunday. Drawing-Room Sleeping Coaches through to Chicago; but one change of day cars.

7:00 P. M., Daily. The Palace Hotel Train to Chicago. Drawing-Room Sleeping Coaches and Pullman's Hotel Dining Car, through without change; but one change of day cars

The only fine running Hotel Dining Cars out of New York. A ride of nearly a thousand miles without leaving the car to eat, drink or sleep!

ELGIN WATCHES.

DECLARED by Railroad Officers, Engineers, Astronomers, Explorers, Navigators, Travelers and others, to be the **Most Accurate, Durable** timekeepers in the world.

26 GRADES now in the market, including **Ladies and Gentlemen's** sizes, **Key** Winders, **Stem** Setters, Full Plate, Three-Quarter Plate, Plain, Full Jeweled, Etc.

PRICES ranging from a few dollars for **plain** but **neat, Durable** and **Reliable** timekeepers in Silver cases, to two hundred or more dollars for a highly finished and remarkably accurate one in fine Gold cases.

AVOID all C. O. D. advertisers and apply to dealers of known respectability, as Elgin Watches are not furnished to **any party whatever** to be sold on the disreputable C. O. D. plan, which is used to palm off imitation and pinchbeck goods.

DEMAND and receive with your watch the regular warranty medal of the Company, as noted below, and see that the name and number correspond.

THE WATCH named T. M. Avery is offered at such prices as to come within the reach of all, and is unequaled in the world for the money.

GUARANTEE The Company makes no watches at *any price*, low or high, which it is not willing to FULLY WARRANT. Each watch movement of *any and every grade*, made by the Elgin National Watch Company, and bearing its trade-mark "*Elgin, Ills.*," is accompanied by the *official* WARRANTY MEDAL of the Company, with number and name corresponding to the watch.

FOR SALE by respectable Jewelers in nearly every town in the United States and Canadas, and also in the principal cities throughout the world. *Call on your jeweler and ask to see them.*

Rural Architecture.

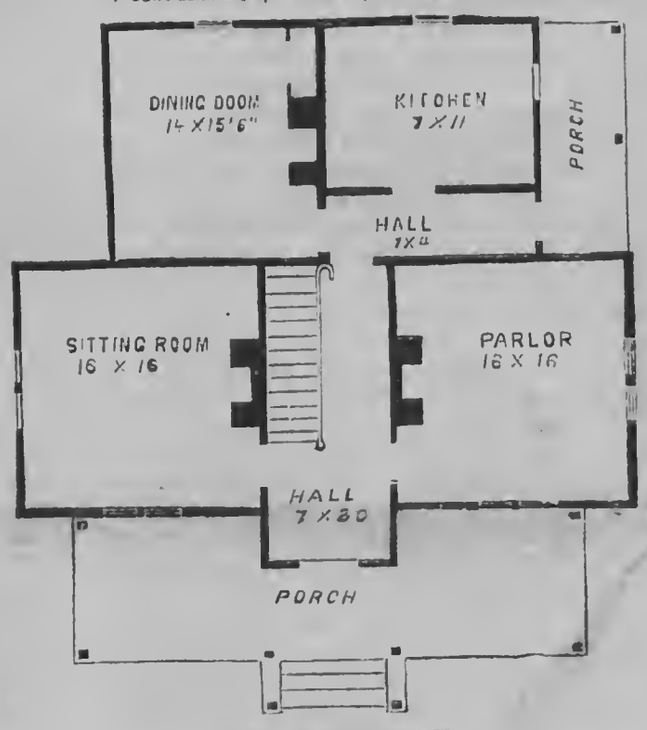
PLAN OF A SUBURBAN COTTAGE.

An article published in the RURAL some months ago (Sept. 18, 1875) — entitled "Cottages and Cottage Life, with Special Reference to Cottage Architecture at Oak Bluffs, Martha's Vineyard"— opened with the remark that "Cottage Architecture has been greatly improved during the past decade," and concluded as follows:—"We rejoice that Cottage Architecture is receiving so much attention all over the land, and trust the subject will continue to exert an influence upon the minds and affections of people who believe in home comfort, and cheap, comfortable homes. During the past quarter of a century we have published plans and descriptions of many excellent cottages, of various styles, sizes and prices, and, being desirous of hereafter doing all we may in promoting improvement in the same direction, invite those informed on the subject to give RURAL readers the benefit of their experience and suggestions in and concerning cottage building, ornamentation, etc."

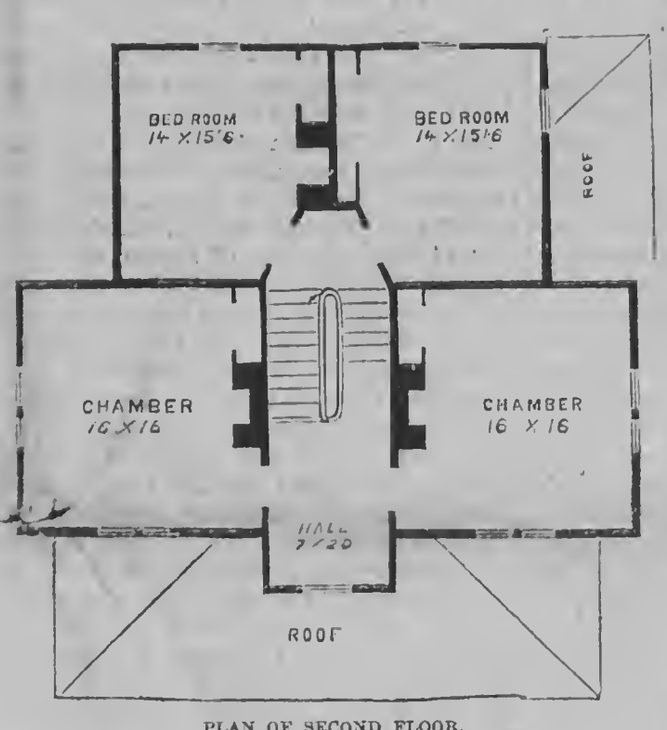
In response to the above invitation we have received from correspondents, and obtained from architects, several plans of Cottages of different styles and cost of building, which we propose giving during the year. Our intention is to give such a variety of plans that many country and suburban residents, (as well as the temporary habitues of seaside and other summer resorts,) will find something consonant with location, taste and means — and we again invite designs and suggestions from those disposed to give others the benefit of what they know about Cottage Architecture. Meantime we take pleasure in presenting the accompanying Plan of a Suburban Cottage.

This design was furnished by Messrs. DRUM & KUHN, Architects, of Pittsburgh, Pa., and from it, we understand, several cottages have been built in the suburbs and vicinity of that city. The perspective view will, we think, please many of our readers, while the floors seem to be conveniently arranged. The building may be constructed with a "balloon frame," or the walls can be built of brick, as preferred. The roof of the main building should be covered with slate—those of the verandas and dormer windows with tin. The interior arrangement is made so plain in the plans as to be readily understood,

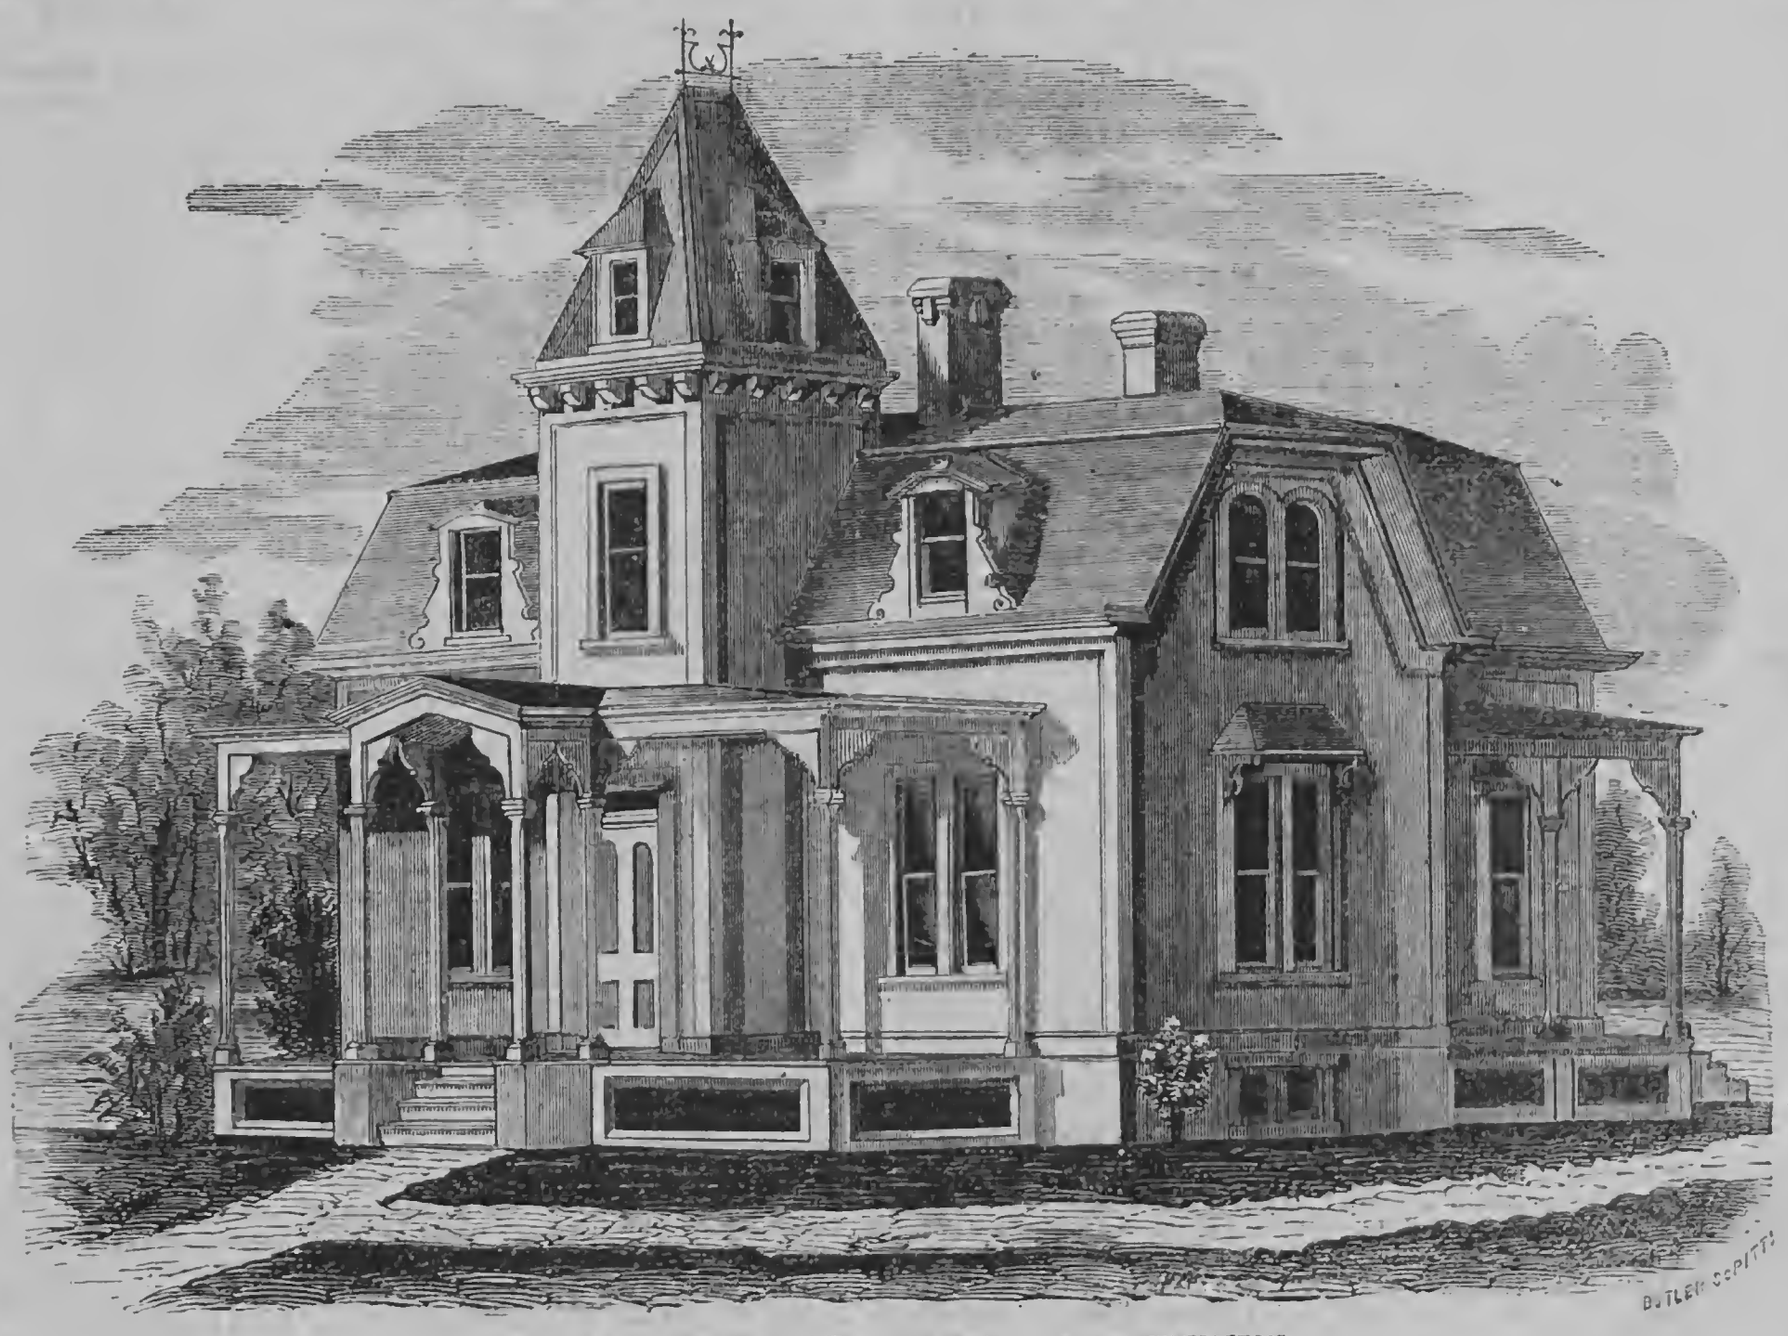
The architects say that this cottage, if built in a neat and plain, but substantial manner, will cost from $4,000 to $5,000,—and would, if erected on a good-sized lot, with the surroundings kept in order, present a very pleasing appearance. Of course the above estimate of cost was made for the vicinity of Pittsburgh, where lumber must be cheap. The cost of such a building would necessarily vary in different localities, according to the price of lumber, wages, etc.



PLAN OF FIRST FLOOR,



PLAN OF SECOND FLOOR.



SUBURBAN COTTAGE.—PERSPECTIVE VIEW OF ELEVATION.

POSITION OF A RESIDENCE.

HOUSES on streets running nearly north and south are far preferable to those located on those going east and west, in a sanitary estimate. In the first, here at the north of the equator, the sun shines brilliantly in the forenoon on the front, and with nearly equal force in the afternoon on the rear. Thus dampness is expelled and the whole edifice is dry and the air far purer for its solar exposure. If a house is on an east and west street, those fronting north are decidedly the best for a residence, because the sun's action on the yard, the kitchen, and usual regions of neglected accumulations, purifies and modifies the humid atmosphere that is sure to predominate in yards and the back side of houses whose rear is north of the street. Thus circumstanced, the back rooms are never so pleasant, cheerful or economically warmed in winter or ventilated in summer, as when on the south side. Opening on the street, the frame of each gets both light and air by reason of the frequent swing of the front door. Here is a law of health in a nutshell.

DURABILITY OF WOOD.

WE expect wooden buildings to decay, and if they endure for a century or two they are regarded as venerable specimens of antiquity. The First Baptist meeting house in Providence, R. I., a fine architectural model, is said to be as sound, even to the top of its lofty spire, as when first built, though nearly a century old. But this is a young infant compared with some European churches. The trusses of the old part of the roof of the Basilica of St. Peter's, at Rome, were framed in 816, but when carefully examined in 1814 were found to be perfectly sound and good. The domes of the church of St. Mark's, at Venice were built nearly eight hundred and fifty years ago, and the outside timbers are yet good. Brick and stone could hardly last better than such woodwork. Timber cased in plaster and in iron, however, has developed a very dangerous kind of dry rot.

A NOVELTY in building is to have a window directly over the mantel-piece. The effect is said to be very pleasant; but it must be queer to lean on the mantelpiece and look out of doors over the clock!

Farm Economy.

WHAT ARE THE TRUE PHOSPHATIC FOODS?

Ever since it was discovered that the brain abounded in phosphorus, the endeavor has been to find some kinds of foods abounding in the phosphates in order to stimulate and invigorate its action. Fishes and wild game have claimed pre-eminence among phosphatic foods, and many a table has been graced with these delicacies in the hope of imparting greater mental activity. How this means of intellectual progress has resulted is not clear. Mark Twain once wrote to a young man, who asked him what he should do for his brain and if a fish diet would not be beneficial, advising him to swallow a couple of whales—not the largest whales, but moderate-sized ones—every day for a year, after which he might become of average intelligence; but though several years have passed since the prescription was given, we have yet to hear that any remarkable result has followed its adoption. With all the phosphatic food eaten of set purpose and for the brain rather than the body, it is to be feared that very little "took." Nobody has come forward luminous with phosphatic light, and men who can set rivers on fire are fully as scarce as ever.

We might have suspected as much. Savage and semi-savage people the world over have for ages lived on fish and game, the highest forms of phosphatic food; but somehow these advantages have not developed them out of their barbarism. What reason have we for supposing that eating fish frequently will develop powers of mind in civilized men greater than those possessed by island savages or Esquimanx, who live on fish all the time? In civilized lands no classes eat fish more frequently than fishermen themselves, but, though often enterprising and wide-awake business men, fishermen have developed few poets, philosophers, scientists or statesmen. The association of fish eating with brain power seems to be a fanciful deduction from a chemical fact, but not sustained by practical experience.

On this question we wish to suggest rather than affirm or even propose a new theory. Is it not possible that the large proportion of phosphates in fish and other animal food are not easily assimilable in the human economy, and therefore not available for the brain? We do not reject animal foods, as they have important uses; but does not the Scriptural declaration that "all flesh is grass" give a hint that to vegetables rather than animal food we must look to the highest development of mankind? If so, the fact is of immense importance, and illustrates remarkably the wisdom of the laws on which human progress depends. If animal foods were essential to the highest development of humanity, only an infinitesimal portion of mankind could ever become really great by exclusive feeding on slaughtered animals. The narrowness of the chance for advancement would intensify human hates and make the world a worse turmoil and hurly-burly than it is, with the certainty that as population increased the exclusive flesh or fish diet must become less common, and civilization and progress proportionately decline. The exact reverse of this suppositious condition of things is the fact. May it not result from an exact reversal of the the theories on which it was based? May it not also be true that phosphates, in order to be made most available as brain food, must first pass through some form of vegetable life and thus be taken into the human economy? The great facts of human sivilization harmonize with this theory as they do with no other. The beginning of civilization is always the abandonment of a life which depends upon fishes and wild game, and the adoption of the growing of grains and edible plants. The progress and character of civilization depends largely on the kind of grain used. Wheat, oats and barley are the grains most abundant as phosphates, and where they are the staple foods civilization has reached its highest development. Rice is a less-developed grain, poorer in phosphatic material, and rice-fed peoples, like those of India and China, have a less vigorous and fruitful civilization. In this country fashion has largely neutralized the advantage of our wheaten diet by taking the phosphatic portions of the grain from the flour. This, however, confirms our view. Fashionable people are mainly fools, and are becoming more and more so every year. The only sensible people of the country who continue to eat white bread generally manage to get a considerable portion of phosphates in corn bread and hominy; but even they would be a good deal brighter and smarter if they ground their wheat *whole*.

This subject of dieting on phosphatic foods enlarges. It is pretty well established now that grains of any kind grown on fields rich in phosphates are themselves richer in phosphates than if grown where there is a deficiency. The proportionate increase is not great; but it is appreciable by chemical analysis, and probably still more by the more sensitive human economy. It is of no use to eat fishes or bones or phosphates in any kind of animal organisms with the hope of thereby benefiting yourself. Apply your phosphates to the soil as food for wheat and corn. They will give you increased crops; but in addition to this there will also be a slightly increased amount of phosphates in the wheat and corn grown, and these will be in form to be of the greatest benefit to the consumer. Who shall say when the farmer does this that he does not stand at the base of all improvement, slowly but surely raising all mankind to a higher level? Universal experience shows that the amount and character of phosphatic grains eaten by any people is as fair an index to their civilization as any that can be adopted. Will not the rule hold further, that by increasing the phosphatic composition of plants, even in the very slight degree now possible, is an important means to advance civilization? There is reason to hope that this increase will be progressive, and that new varieties of wheat and corn grown from seed rich in phosphatic elements will in time develop food whose stimulus to thought and brain will exceed anything now deemed possible.

But it isn't worth while to become too enthusiastic over theories which experience may prove wide of the truth. We have here placed some thoughts on record mainly as suggestions which it can do no harm to think about.

A FARM OF 25 ACRES.

A. N. Kent of Bucksport, Me., believes that farming will pay even on a small amount of land. He gives the results in the Maine Farmer of the past year's operations on a farm of twenty-five acres. We quote it, not as anything extraordinary; but merely showing results no greater than many others have achieved under equally favorable circumstances. It is evident that this farm though small is a rich one.

Mr. B. F. Farnham of Bucksport, Me., has a small farm of 25 acres, five in tillage and the rest in pasture. He cut the present season eight tons of good hay, and raised from eighty-nine rods of land, 2500 lbs. of squash, 80 bushels Mangold Wurtzel beets, 40 bushels carrots, 40 bushels potatoes, 5 bushels beans, 60 bushels rutabaga turnips, besides sweet corn, pole beans, green peas, &c., for summer's family use.

The first ten rods was planted with squash, hills 8 feet apart, made broad and deep with the spade, and potatoes drilled between the hills, from which he raised 2500 lbs. squash, and 15 bushels potatoes. Twenty rods in Wurtzel beets yielded 80 bushels; nine rods in carrots 40 bushels; sixteen rods in potatoes 25 bushels; twenty rods in turnips 60 bushels; fourteen rods in beans 5 bushels; seed planted, 6 quarts. No fertilizers were used except stable manure, and he believes we should make our own fertilizers in our own stables. He has used phosphates in years past by way of experimenting, but believes good hard wood ashes as valuable as the phosphates we generally purchase.

After the ground is prepared for the seed, about all the work and weeding is done with Harrington's patent seed sower and hand cultivator, of which Mr. Farnham speaks in the highest terms. After harvest, his land was thoroughly plowed and cultivated, and laid down to grass in November. Mr. Farnham keeps two cows, from which he has sold the present season, $80 worth of milk; two calves for $4, and made 240 lbs. butter, besides what milk and cream has been used in his family of five, and they are "good livers." He believes cows do quite as well in winter on good hay and roots, as on oil cake, cotton seed meal or shorts, which no farmer can afford to buy:—we can raise roots much the cheapest. In feeding Mr. Farnham changes in roots each day, feeding turnips, wurtzels, and carrots alternately. His pig killed at the age of eight months and twenty-one days, weighed 406 lbs. I asked Mr. Farnham why he did not tell the farmers through some agricultural paper how he raised his pig, and give them the benefit of his experience, he replied:—"Farmers would laugh at me, a blacksmith of 25 years, to try to tell them how to raise a pig. But I have been experimenting for four years on the best way to raise a pig, and I have found by fermenting all the food he eats after the age of six weeks, we can get the best pig for the amount of labor and food consumed. All food but refuse potatoes, beets, squash, &c., is fed uncooked, and in all cases fermented before feeding. I have a tub where sour food is always kept, and when his morning food is taken out his dinner is put in, and when his dinner is taken out his supper is put in. Food should not be allowed to get too sour in hot weather. All vegetables are cooked and soured in the same way. My pig has had only ten bushels of meal with small potatoes, squash and beets, &c., with what milk we had to spare." It must be remembered two calves were kept to the age of four weeks, and 1200 qts. of milk sold, besides what was used in the family, which would take the milk of one cow at least. He has made two cords of excellent manure from his pig, which was applied to the land before laying it down to grass in November.

The pig was Chester White, crossed with the Suffolk, obtained from one of our best breeders, Mr. J. Cunningham, who from nine sows has raised 140 pigs this season. He tries to breed for the best pigs for the amount of food consumed at the age of about eight or nine months. How well he succeeded the scales will tell, as in past years very many will tip the beam at over 300 lbs. at that age.

MEAT AND MANURE.

Let it be remembered that the manufacture of beef is only profitable when it is coupled with the production of manure. Both scientific and practical men are agreed on this point, and hence the preservation and perfect making of dung is a matter of great importance. All good buildings should be contrived so that the manure from the various animals accommodated may be well mixed. We have in our thoughts a set of farm buildings, designed with much display of scientific knowledge in many respects; but alas! the architect had overlooked this cardinal point, and to this day the horse, pig and cow dung are all thrown into separate heaps, there to suffer from dryness; or, at best, to result in a badly-mixed or inferior quality of dung. Stables and byres should open into courts, over which the litter from the horses and cows should be regularly spread every day. By this means alone will a good result be obtained.

The respective merits of boxes, byres and fold yards for fattening cattle in a great measure depend upon the quality of dung they turn out. The box is economical in the matter of straw, and will be esteemed for this reason in suburban districts. It is also favorable for the manufacture of good manure, as, being under cover, the litter is wetted by the droppings of the animal only. The byre is still more economical of straw, but is not favorable to the manufacture of good manure, owing to the animals being tied up. Litter from byres ought to be thrown out into courts and trodden down with young stock. Fold yards require much litter, as they are always more or less open, and are for this reason preferred in rural districts, where the value of straw is not yet felt.

Excellent manure may be manufactured in small-troughed folds, with a considerable proportion of shedding. Cattle will do well in any of these forms of accommodation; but if tied up in byres, it will be humane, as well as profitable, to have them brushed and currycombed daily. It must be remembered that animals thus confined cannot lick or rub themselves, and that they are deprived of the cooling effects of air and rain. The skin under these circumstances becomes irritable; and especially where, as is often the case in byres, dirt adheres to the animal, brushing and cleansing the skin and attention to the state of the feet cannot be too strongly enforced.—*London Agricultural Gazette.*

The Swine-Herd.

RAISING AND FATTENING LARGE HOGS.

D. G. Brown writes to the Progressive Farmer:—We raise the Poland Chinas, for the same reason that every breeder raises his favorite breeds—namely, because they are the most profitable hogs to raise. The stock has gained its prominent position by being thoroughly tested for the past thirty years; and to-day we find double, if not treble, as many of this breed as all others, which demonstrates their superiority. In selecting those from which our increase is to come, we prefer to get our stock from extensive and experienced breeders who have been engaged in the business for many years, and who can show a uniformity of color and make-up in their swine. Poland China is a mixed breed; there is danger of their being intermixed too much. Notwithstanding we sell many pigs at fairs, our advice to all is to be very cautious in selecting stock at fairs because it is very fat and consequently seems very nice. The best place is the breeder's farm, where all his stock can be seen. We breed young sows to have them farrow in April and May. We find that ground floors are better than plank for sows and young pigs, but the sows must be ringed. Sows are kept separate until the pigs are two or three weeks old, when all are turned together on pasture. The sows are fed on ear corn and water, the pigs on soaked shell corn and what swill the kitchen affords. We wean the pigs at ten to twelve weeks old by turning the sows into another pasture where they get no grain. The pigs are put after cattle in the fall, and they continue there till the grass starts in the spring, when they are turned into pasture, where it is "root hog or die," and noses ringed at that. And right here lies the secret of raising strong, healthy hogs, that will fatten easily, and tip the beam at 500 pounds.

From three to four months in the summer we feed no grain to hogs. We feed the new corn sparingly, until it is hard enough to crib. It is poor policy to stuff hogs with green corn, especially to fatten them in a few weeks; they eat a large amount, if fed, and do not give half return for it. When hogs are fed corn all summer they should be fattened and sold off of the old corn. It is folly to undertake to put the fat on a hog with green corn. His whole material system has to first undergo a change before he can make a fresh start, which is too expensive with soft corn. Green corn should only be fed to thin hogs, and sparingly at that.

We give our hogs in winter a warm place to sleep in—a dust nest, which is always the same temperature. We feed till February. During the last three years the lightest lot of hogs we have sold averaged four hundred and twenty pounds, and the heaviest four hundred and eighty-seven pounds. We boldly assert that by our mode of feeding these weights were attained with less grain, trouble and expense than they could be by any other mode.

We are positively opposed to feeding cooked food to pigs and growing hogs. If pigs are to be crowded for early market, or matured hogs to be fattened, it may pay to cook feed. We don't believe that nature designed, that swine should have cooks. It is the worst thing a farmer can do to feed his growing breeders cooked food.

A PROFITABLE HOG.

The following description of a profitable hog, was reported by the committee, at the Swine Breeders' Convention at Indianapolis, Ind:

He must have a small, short head, heavy jowl, and thick, short neck; ears small, thin, and tolerably erect, not objectionable if they droop slightly forward; must be straight from the neck back to flank; must be let well down to the knees in brisket; of good length from head to tail; broad on the back; ribbed rather barrel-shaped; must be slightly curved or arched in the back from shoulder to the setting on of tail; tail, small; long in the ham from hock to letting off the loins; shoulder not too large to give symmetry to the animal; ham broad and full; hair smooth, and evenly set on; skin, soft and elastic to the touch; legs short, small, and well set under; broad between the legs; good depth between bottom and top of the hog; with pleasant, quiet disposition; should not weigh more than three or four hundred pounds gross, at twelve to eighteen months old, according to keep; color may be black, or white, or a mixture of the two. The above described hog, will measure as many feet from the top of the head, to setting on of tail, as he does around the body, and will measure as many inches around the leg below the knee, as he does feet in length around the body; depth of body will be four-fifths of his hight.

HOG FEEDING EXPERIENCE.

A hog-raiser and pork-packer in Iowa gives the following statement as his experience in the business:—"He has demonstrated to his entire satisfaction, that after his spring pigs had reached about three hundred pounds they ceased to grow with any profit. His pigs on the first of January weighed nearly as much as they did on the first of February, notwithstanding he had kept up the feeding. He is a great advocate of taking good care of hogs. He would never shut up his hogs more than five weeks before he wants to market them. His food early in the fall was pumpkins, steamed and mixed with middlings, the proportion being about one-half a bushel of middlings to forty gallons of steamed pumpkins. His object was to develop the bone and muscle of the hog without adding fat. This he continued three months, and then put them in a close pen and fed them meal and middlings steamed. After shutting them up for five weeks they gained two pounds a day until they reached three-hundred pounds, and then ceased to grow to any extent,"

ALARMING SPREAD OF TRICHINOSIS.

The Transaction of the Indiana State Medical Society, 1875, contain a report on trichinosis, by Dr. George Sutton of Aurora, Ind., which contains the following alarming observations:

From microscopic examination of pork killed in Southeastern Indiana, we have found from three to sixteen per cent. of the hogs affected with trichina. Over five millions of hogs are slaughtered and packed in the Western States; not including those which are put up for family use by the farmers; if four per cent. of this pork is diseased, which we believe to be a low estimate, we have 221,484 diseased hogs put annually upon the market. Ninety per cent. of disease produced from eating trichinous pork appears either as gastro-entiritis, or as a diarrhœa or dysentery, and that these diseases cause a mortality of more than 31,000 in the United States every year.

Dairy Husbandry.

PENNSYLVANIA DAIRYMEN'S ASS'N.

PROCEEDINGS OF ITS FIRST ANNUAL CONVENTION.

MEADVILLE, Pa., Dec. 30, 1875.

[Concluded from Page 39.]

THE Convention, on motion, adjourned to the banquet which was given by the citizens of Meadville in honor of their guests. The good things were abundant and received ample justice at the hands of the guests. Speeches were made by prominent gentlemen, and the whole was enlivened by the Meadville Cornet Band.

SECOND DAY.

The proceedings were opened with an address by Col. O. O. POTTER of Potter's Corners, Pa., on

GRASS.

The first part was a general dissertation of no peculiar interest, in which Col. P. gave some good advice to farmers about acquiring business habits and conducting a dairy farm on principles that guide the merchant in his pursuits. Fire and the plowshare must be employed to reduce worthless meadows and fruitful pastures, the sweetest grass being only obtained from rich and well cultivated soils. [Here followed a species of subdued advertisement of the marl beds near his home.]

A greater variety of grasses should be sown, as timothy and clover are not the highest possibility of grass, meadow fox-tail grass being worthy of adoption among others, as it is succulent and nutritious. The blue grass has few equals in the pasture; but if the soil is thin and sandy wire grass flourishes best. Red top is excellent, but white top is good, especially when land is subject to overflow. He deprecates sowing timothy and clover together, but clover and orchard grass are a happy combination.

On the conclusion of the address, Mr. FARRINGTON of Crawford asked the speaker why he objected to clover; to which Mr. POTTER replied that his cattle did not like it, and he shared their aversion, as they would not eat white clover when other food was obtainable. Mr. FARRINGTON'S experience with his cattle was just the reverse, and in Herkimer Co. the best cheese was made in the flush of white clover.

Prof. L. B. ARNOLD being called upon, agreed with Mr. POTTER, and said, in reply to Mr. FARRINGTON, that the excellence of Herkimer Co. cheese was due more to other grasses, the clovers not being considered the best dairy grasses.

The Query Box was opened and a number of questions asked and answered; but there was a lack of animated discussion, and no spontaneity to speak of. This was observable during the whole of the proceedings. In most instances the President noticed by name gentlemen whom he thought should have something to say. The President was indefatigable; and the gentlemen of the Convention were indefatigable also—in remaining quiet.

Prof. ARNOLD of Rochester, N. Y., delivered a very learned essay on

THE SECRETION OF MILK,

illustrated by numerous diagrams. The address was so largely dependent on the illustrations for its intelligent comprehension, that the briefest mention here only is practicable. It was very attentively listened to, and created such a profound scientific impression that no comment was elicited at its close, except of a complimentary nature. It is the same address delivered before the Northwestern Dairymen's Ass'n in a modified form.

THE AFTERNOON SESSION

was opened by the annual election of officers and reports of committees.

The Committee on the Nominations of Officers, consisting of A. E. Harper, Evansburg; S. A. Farrington, Cambridge; Wm. H. Blystone, Erie Co.; D. H. Nodine, Cochranton; O. O. Potter, Potter's Corners; Samuel Reeder, Wm. Porter and H. Camp, all of Erie Co. They reported the following Board of Officers for 1876. The report was unanimously adopted:

Pres.—A. M. FULLER, Meadville. Rec. Sec.—H. Greene, Meadville. Cor. Sec.—J. M. Bigger, Cambridge. Treas.—Ira W. Hall, Randolph, and twenty Vice-Presidents, as follows:—Joseph Blystone, Venango; Wm. Porter, Chapinville; N. W. Power, Conneautville; Wm. Morse, New Richmond; L. L. Lomb, Townville; — Warner, Sugar Lake; A. W. Beatty, Shaw's Landing; S. Logan, Hartstown; John Cole, Crossingville; S. Reeder, Edinboro; R. H. Arbuckle, Erie; D. W. Titus, Phillipsville; Hon. Wm. Benson, Waterford; T. C. Cochran, Sheakleville; J. W. McConnell, Milledgeville; E. W. Hamilton, Cherry Tree; — Hopkins, Pleasantville; Hon. Mr. Wetmore, Warren; Hon. M. Leach, Greenville; S. E. Kinkale, Wayne.

The Committee on Constitution and By-Laws was composed of John Cole, Chairman, Venango; Ira R. Hall, Randolph, and J. M. Bigger, Cambridge. At the request of Mr. COLE, Mr. BIGGER submitted the report, which consisted in reading the Constitution and introducing a few modifications of the By-Laws. It was adopted.

Messrs. WM. MORSE, H. CANFIELD and WM. NASH, all of Crawford Co., were appointed to draw up a plan for the united action of factorymen, and submitted the following report:

Your Committee to promote united action and create a better feeling between dairymen and factorymen, recommended:—1, That factorymen buy all the milk of patrons or none; 2, That they use no undue influence to induce patronage of their respective factories, except by striving to make a superior product; 3, That the percentage plan is the true plan of conducting factories.

The Committee on Dairy Products report as follows:

Your Committee report four lots of cheese exhibited and branded respectively, "Cochran Farm," "Nash," "Hall," and "D. H. Gibins," being all so nearly alike in their general excellence, there could be no invidious distinctions drawn and all were approved. Signed by L. B. ARNOLD and FLINT BLANCHARD.

The Committee on Dairy Utensils (consisting of D. H. GIBINS, J. H. PHELPS and DAVIS PECK) report that the Cow Fetter, patented by H. J. SADLER, Mecca, Trumbull Co., Ohio, seems to possess merit, and recommend dairymen to try it.

A full size model of Gifford's Swinging Cattle Stanchion, exhibited by W. C. GIFFORD and A. C. ROBERTSON of Jamestown, N. Y., after a thorough examination, we found it to possess the following the following merits:—Each Stanchion is independent of all the others. they are hung at the upper end and swing forward as the animal rises to its feet, thus obviating the straining that cows are subjected to in the stationary stanchions; they are self-closing and fastening; the space for the animal's neck can be quickly and securely adjusted to any desired width, without removing the bolts; for ease and comfort to the animals and convenience to the owner, they are certainly a very great improvement and worthy the consideration of every dairyman and keeper of cattle in the country.

Your attention is also called to the Common Sense Milk Pan and Cooler, made by ELLIOTT & OAKES, Cattaraugus, N. Y., as exhibiting many points worthy the critical attention of dairymen.

A. J. DIBBLE, Franklin, N. Y., exhibits a butter-worker whereby the butter can be washed, weighed, worked, and salted without being removed from the worker. There is also attached a simple but effective mill for crushing and preparing the salt for use. We recommend it to the use of dairymen.

ALVIN MIDDAUGH of Friendship, N. Y., exhibits a Milk Tester on a novel plan, whereby he can work up samples of each patron's milk by itself, thereby practically testing its comparative quality.

HANNAN & OBITTS, Elyria, Ohio, exhibit the model of a Self-Heating Cheese Vat, which seems to possess some good features.

C. W. GRANNIS, Gowanda, N. Y., exhibits his patent Empire Milk Cooler and Cheese Vat, which cools the milk on a new principle—cooling from the center instead of from top or bottom. The cooler is detachable from the vat, and the whole apparatus is thus made to do a variety of duties. It is worthy a trial. We also commend the same inventor's new Empire Butter Package.

D. H. GIBINS, *Ch'n.*

Mr. FLINT BLANCHARD of Jamestown, N. Y., then read a paper on

DAIRY SPECTACLES,

The speaker enumerated the various sights, and dwelt feelingly on the "hind sight," as being one farmers more particularly lacked. Any defect of this kind indicated spectacles, and the dairymen should at once proceed to wear them, when they would clearly see that they needed—1, A farm adapted to the business; 2, Well kept cows, of a good breed; 3, The proper handling of the milk and proper care of the product derived from it, these being the three essentials to success in dairying. It is such defective vision that causes most of the mistakes in dairy farming. The speaker here enumerated various varieties of spectacles, from convex to plano-convex, in a metaphorical sense. He asked how many dairymen had seen the inside of a cow?—which was given up. The cow needs skillful handling, wholesome food and good care to develope her best milking capacity, and unskillful handling of her product is the destruction of profits. All work on a dairy farm leads up to the finished product, a fact that is too often lost sight of, as is evidenced by the manner in which what are called "chores" are slurred over. Five minutes' careful work with the churn often adds 5c. per pound to the butter. The difference between the price of prime and inferior butter would, the speaker thought, pay the taxes on the dairy farms of Crawford County. Farmers are to use their spectacles especially with reference to selling their products, as the rascality prevalent among commission men is a source of great loss. It is best, as a rule, to sell at home and get your pay when goods are delivered. It is also best to sell when the goods are ready to be marketed, and not wait for a rise in quotations. It is delusive.

It is an evidence of short-sightedness to buy cows because they are cheap, without regard to quality,—to construct poor milk rooms, and deliver poor milk to factories. There are those who use a telescope for one eye and a microscope for the other, and their transactions are proportionately disproportioned. Those dairymen who make 300 lbs. of butter per cow say the extra expense does not exceed $12 per head, 200 lbs. being taken as the average, thus yielding a profit of $18 per head, taking 30c. as the average price. By sowing corn and clover we are insured against drouth or a short hay crop. It matters not that associations have defined what is necessary for farmers to do so long as they do not act on the facts promulgated. The speaker commends the factory plan and deprecates the habit of working the wife and daughters to death, simply because they are willing to be so worked, and suggests that farmers fetch their wives to Conventions. A dairy farm could always be pointed out among other farms by the air of thrift and cleanliness that characterize it. Make cheese so good that people, like babies, will cry for it and send to oblivion oleomargarine.

Mr. BLANCHARD said, in closing, that, in his judgment, 30c. was just about the cost of butter, and it could not be made—a good article—for less.

Numbers left the Convention at the close of the address, and only those remained who were not compelled to leave the city by departing trains. The few present listened to an interesting account of the Chemical Constituents of Milk, by P. A. LAFFER of Meadville.

After complimentary votes of thanks to the Officers of the Association, which were appropriately responded to, the Convention adjourned *sine die*—thus closing a very interesting and successful meeting. C. H. E. R.

DAIRY STATISTICS FOR 1875.

A CORRESPONDENT desires to know, "What has been the average price of cheese received by the factories of New York during the past season." This question can be better answered when the factories have returned their reports of the season's operations. So far as we have examined reports that have been already made, the average price will be below 12c. per pound. The Utica Herald prints the returns from several factories from which we select such items as will be of interest and arrange them in tabular form, so our readers can see at a glance what these factories have been doing and can compare one with the other. We presume there are some factories in the State that can make a better showing than is here represented, but we doubt whether these will raise the average price on the whole much, if any, above 12c.

Factory.	Whole number lbs. of cheese made.	Average lbs. of milk to lb. of cheese.	Average price per pound of cheese.	Net price per lb. of milk to patrons.	Best average, per cow, in a single dairy.	Lowest ave'ge. per cow, in a single dairy.
Fulton, Oppenheim, N. Y.	135,430	10.017	11.95	1.027	—	—
Willow Spring, Oppenheim, N. Y.	731,480	9.834	11.67	1.013	—	—
Gillett, Gouvernemeur, N. Y.	224,737	9.81	12.5	1.118	$44.85	$30.00
W. W. Sears, So. Champion, N. Y.	152,266	9.71	12.253	1.15	48.00	30.00
C. H. Curtis, Waterville, N. Y.	Cheese 20,724 Butter, 3,250.	10.4186	—	1.04075	—	—
South Granby, South Granby, N. Y.	90,090	10	11.25	0.95	41.50	23.90
Miller, Constableville, N. Y.	184,475	9.742	11.8125	1.063	55.75	32.05
Wert Fowler, Shingle Creek, N. Y.	114,685	9.90	11.25	0.98	30.63	21.70

* Thus it appears that of these eight factories only two have reached 12c. per pound for their cheese; and if we allow 2c. per pound for making and furnishing the cheese for market, the average net price received by patrons will not be far from 10c. per pound. The two columns showing best and lowest average money per cow, in single dairies, offers food for reflection. When herds are kept that yield only about $22 per cow for the season, it must be pretty evident that there is no profit in the business, and such small returns should admonish dairymen to take more pains in securing good cows; for a cow that will not turn more than $22 during the season does not pay her keep. All such animals had better be sold and their places filled with better milkers or else the farm be devoted to some other branch of agriculture than the Dairy.

WATER IN WINTER.—Cows giving milk need an abundance of water. The dry hay usually given affords little material for milk, and even with abundance of roots, unless water is placed within easy reach, cows will tend to fatten rather than to milk production. A great difficulty in cold weather is in having water so far from the yard that cows will suffer long before going from comfortable quarters to reach it. Whenever possible a cistern should be constructed under the barn or under ground to hold water for stock.

The Herdsman.

PAMPERED ANIMALS.

IN its veterinary department, the Prairie Farmer gives the following true statement concerning the value of pampered animals for breeding. There should be a sharp line drawn at the fairs between fatted and breeding stock, but the evil noted below is of common occurrence. The Farmer prints it as follows:

Query:—Are the monstrously fat bulls and cows, now seen at our State and county fairs in America, to be looked upon as normal types of the bovine tribe; and ought such animals to be allowed entrance for competition among the breeding stock?

Answer:—This subject deserves to be discussed and acted upon more extensively by our breeders than has hitherto been done. Space forbids us, in this department of our paper, to give more than a few general remarks, though it is a subject upon which a small-sized volume might be written, and which ought to be taken up by a pen abler than ours. The enormous and rapidly increasing demand for meat which characterizes the food markets of these days, has reacted in a remarkable manner upon the nature of the animals that supply it. Formerly the animals that furnished pork, mutton and beef, were allowed to attain the age of three years old and upwards before they were considered to be ripe for the butcher; but now sheep and pigs are perfectly matured at the early age of one year, and two-year-old oxen furnish a large quota of our roast beef. The so-called improvement of stock is simply the forcing of them into an unnatural degree of fatness at an early age; and this end is attained by dexterous selection and crossing of breeds, by avoidance of cold, diminishing as much as possible their muscular activity, and lastly and chiefly, by overfeeding them with grain and concentrated aliments.

Every one knows that a man so obese as to be unable to walk cannot be in a healthy state; yet many feeders of stock look upon the monstrously fat bulls and cows of prize celebrity as normal types of the bovine tribe. It requires but little argument to refute so fallacious a notion. No doubt it is desirable to encourage the breeding of those varieties of animals which exhibit the greatest disposition to fatten, and to arrive early at maturity; but the forcing of individual animals into an unnatural state of obesity, except for purely experimental purposes, is a practice which cannot be too strongly deprecated. If breeders contented themselves with handing over to the butcher their huge living blocks of fat the matter would not, perhaps, be very serious; but unfortunately it is generally the practice to turn them to account as sires and dams. Were such a one as we a judge at a cattle show, we certainly should disqualify every extremely fat animal entered for competition among the breeding stock. Unless parents are healthy and vigorous, their progeny are almost certain to be unhealthy and weakly; and it is inconceivable that an extremely obese bull and an unnaturally fat cow, could be the progenitors of healthy offspring.

We should by all means improve our live stock, but we should be careful not to overdo the thing. If we must have ponderous bulls and cows at our fairs and exhibitions, let us condemn to speedy immolation those unhappy victims to a most absurd fashion; but in the name of common sense let us leave the perpetuation of the species to individuals in a normal state, whose hearts are not hypertrophied, and whose lungs are capable of effectively performing the function of respiration.

HOW MUCH MEAL TO FEED.

A VILLAGER wants to know how much meal it is profitable to give a new milch cow, per day, meal at 85 cents a bushel and hay at $15 a ton. The Vermont Farmer answers the query as follows:

The only man who can answer that question with any degree of accuracy is the one who takes care of the cow. His information upon the subject to be obtained by varying the feed and noting the effect. There is a wide difference in the capacity of cows for assimilating food, and as great a variation in the power to convert it into butter. Some cows never pay for their keeping, be it what it may.

It may be stated as a rule that it pays to feed milch cows meal with liberality, especially so if both hay and meal are bought. Much depends on the quality of the hay. Early cut June grass hay will make as much milk as a fair quality of timothy hay and two or three quarts of meal a day. From two to four quarts per day, of meal, is probably as much as an ordinary cow will pay for.

It is better economy and more healthful for the cow, and we believe for those who use the milk as food, to give a mixed ration. Say wheat bran four or six parts, wheat middlings two parts, corn meal two parts and linseed meal one part, by measure, and feed the cow as much of that as she shows herself able to pay for whether it be four quarts or eight.—*Ex.*

Industrial Topics.

WORK, WORK, WORK!

This is about all a great many can talk about, as if the creator intended man to do naught but work. Industry is essential to success in life, but the mind must guide the bodily work or a life-time of drudging and constant, never-ceasing labor will not amount to much. Brains will save the muscles very much, and it was intended the mind should rule and save the body. Religious people have a great faith in real, hard labor, but there is nothing said by any writer to show that those, most in favor with God, were such wonderful workers. There is a great antipathy expressed toward rich men, especially such as filled their barns and gloried in their wealth. The ones nearest to God's liking were those who had flocks and herds, the attendance on which was not hard work. In the new Testament this eternal yearning for "laying by for rainy days" is often rebuked and the Son of God says "take no thought for the morrow," and in the model prayer, the Lord s prayer in the bible, published in England it is, "give us this day our daily bread." There are many more cautions, etc., against laying up worldly possessions, but putting on one side religious teachings, the common sense given to mankind, ought to show that the greed of those who work! work! work! through the prime of their lives in such an unnatural way, crying "Come on" to others, must be tremendous fools for their pains, as not one man in a thousand ever enjoys his hard-earned gains. Some are poisoned by relatives to hasten the getting possession of their wealth, some are murdered by strangers, and the majority of those left, know full well it is their money which commands the homage of the public, and if that were gone they might die in a ditch.

Who are those who cry "work, work, work" by day and by night? It is those who make a great talk of working but who live on other people's work, and who are bodily the very laziest men in the world; like those who make laws to punish dishonesty, and the lawyer and judges who administer or pretend to apply the law, who altogether, lawmakers and lawgivers, are the most corrupt and most outrageous rogues in existence; for it is known not only to all the American people but to every nation in Europe that those who are elected by the people to offices in the Government and under can be bought to vote for the highest bidder, and New York City, to wit, see how those who work are robbed by those who cry to them to "work! work! work!"

There is not much made by real hard work, it is the scheming, forecasting man who makes money and those who possess talent, for they can make it by other people's work. Nature is capricious, at least it looks so to mortal eyes, for one is gifted to an extraordinary degree and for no reason which can be discovered by man, the parents and all ancestry as far as known having exhibited no superior abilities; yet there will every once in a while arise from a mass of kindred all below mediocrity, a brilliant genius outshining all around, even in the learned circles of men who have devoted lifetimes to the acquisition of knowledge, and it is useless for the sober, slow-thinking men to state that no man can rise to distinction without work, work, work. for these gifted men can accomplish as much in one year as some of them can in fifty years.

Now and then these meteor kind of men become proud of their distinguished faculties and in endeavoring to still farther attain celebrity overstrain the mind, and a wreck and death at the commencement of life ensues; consequently, it is best to steer clear of extremes and instead of so much work, work, work, have some play, for "all work and no play makes Jack a dull boy."

A Working Farmer.

HARD TIMES IN KENTUCKY.

We are seeing hard times in Old Kentucky. Our farmers, it is true, have raised enormous crops of potatoes and corn, but the market is overrun with them, and potatoes bring only 35 cents a bushel and corn 40 cents. The rainy weather injured our wheat, so that there is not more than half a crop. Tobacco does not come up to the standard, although it is better than we expected it would be during the Summer. Our fruit crop was a perfect failure; small fruit was not quite so bad, and the wild was quite abundant. Our crops were late maturing, and if kind Providence had not given us so late a fall, we could not have housed our corn in time to save it. Plenty of corn makes fat cattle and fine beef, as also, I am ashamed to say, fine whisky, for which our State is already too well noted. Around Cynthiana, in Harrison County, and Paris in Bourbon County, distilleries are very numerous; in fact, in driving through this splendid Blue Grass region, one can sometimes count three or four distilleries at one sight that are world-renowned for their fine whiskies. Around Lexington and Paris our farmers pay more attention to fine and blooded stock. Near Lexington Mr. Alexander has an immense farm and has blooded horses. Near Paris Mr. Bedford has cattle that are of the finest blood, their sales every fall attracting customers from all parts of the world. Not long since some of our Kentucky cattle were exported to Europe. We export now instead of import, as formerly.—*Zip in Tribune.*

BUFFALO BONES.

A few years ago, none but the very tit-bits from the carcasses of these monarchs of the American plains were thought worthy of the

THE OLEANDER.

hunter's notice, and, after stripping them of their skins, these huge masses of wholesome flesh were left on the prairies to rot in the sun or to be devoured by the carnivorous beasts and birds that abound there. Now, however, owing to the wanton slaughter that has been carried on during late years, a herd of buffaloes is a most unusual sight in places where, within the memory of those who are still young, myriads of them passed and repassed on their route to pastures new at various times of the year. Now, also according to the Scientific American, not only is the carcass itself utilized, but the bones themselves form the source of a profitable business among the settlers in Kansas. The prairies, for forty miles each way from the railroad, have been gleaned over till not a relic of the chase can be found. Heads and ribs are worth $5 a ton; these are shipped to Philadelphia and ground up into fertilizers. Shins and shoulder-blades are worth $10 a ton; these go to the sugar refineries. The horns are worth $30; the tips are sawn off here, and sent to the factories of umbrellas, fans, pipes, etc. The remainder is used by the chemists. Bits of hide found hanging to the heads are taken off and sent to the glue factories. Every fragment of these animals is made to serve a purpose.—*Land and Water.*

MANUFACTURE OF TEA IN THE SOUTH.

The editor of the Soil of the South (New Orleans) has experimented in the manufacture of tea from home grown plants, and so great has been his success that he has received the highest praise from good judges both in England and America; he has been offered one dollar and a-half per pound for his tea. The following is the process:

Before the leaves are fully matured, or have become tough by age, they are gathered from the plants and placed in an oven, where they remain only a few minutes, or until they are partially heated, but not dried; in this wilted state, they are taken and placed upon the table, where they are rolled and beaten with the hand until they are thoroughly bruised; this process being kept up until the leaves assume rather a dark appearance. At this stage they emit a delightful odor, and have a decidedly oily feeling; this is, no doubt, due to the *theïn*, or essential oil, that gives to the tea its delightful flavor, and which is liberated or expressed by this manipulation. It is then placed in a moderately heated oven and frequently stirred, until it is thoroughly dried, care being taken so that it may not be scorched or burned. It is now placed in boxes or cans, and is ready for use. This is a genuine black tea, resembling our imported sorts, only finer and better flavored.

So soon as hogs cease to fatten they should be killed.

The Vineyard,

SWEET AND ACID GRAPES.

Sweetness has long been considered the characteristic excellence of grapes, and the phrase "sour grapes" has passed into a proverb of worthlessness. If the sourness originates from immaturity nothing can be more unpalatable, for immaturity always implies lack of saccharine properties. A green sour grape possesses few attractions for any one. Many people, however, prefer grapes which when fully ripe have an acid or subacid flavor—not deficient in sugar but by that surest test the saccharometer shown to abound in it, and yet with all this sweetness yielding a distinct and decided acid taste. A grape that is purely sweet with little or no acid is insipid and lacks flavor. It is the combination of sweet and sour which gives richness and delicacy of flavor to such varieties as the Iona and well ripened Catawbas. Nobody thinks of rejecting a well ripened acid apple because it is "sour." For many purposes and to many tastes acid apples are vastly preferable to sweet ones. There is reason why people who prefer acid varieties of grapes, not fruit sour through immaturity, but rich saccharine grapes to those whose main claim to sweetness lies in their lack of acids. To a great many tastes the Adirondac is the sweetest and best grape in existence, but let these same persons eat the rich, sweet and yet acid Delaware and Iona and the Adirondac will taste almost sour by comparison.

Is it possible for a grape to be really too sweet? For late keeping varieties we are almost convinced that it is. We dislike to say any thing against so good a grape as the Salem, the one grape, which for several years, has been our favorite above all others. But eating some Salems the other day, we found that their very slight acidity had entirely disappeared, leaving the fruit too little acid for the highest flavor, and bordering on insipidity. Many of our friends have remarked that the Salem is quite good when not fully ripe. We believe that it is even better to be a little under rather than over ripe, and this is true, generally, of grapes deficient in acid. The Salem is a good grape and an excellent keeper, but though form and size will be well preserved by mid-winter, unless special care has been taken, the freshness and sprightliness which the fruit had in September, will be lost. Rogers 15 and Rogers 4, having the thick skin of the Salem and rather more acid, will probably excel it as winter varieties.

AN ENEMY HATH DONE THIS.

Friend Moore, I send you by this mail, a sample of the work of a new enemy on the grape vine. I say new, because I have never seen it treated of in books, or by any writer in the agricultural or horticultural papers, nor learned that any grape grower has noticed it. It first met my observation on my own grounds some four or five years ago; and, at first, I supposed it might result from attacks of some insect at the root. But, finding the roots apparently healthy, I am in the dark as to its cause, and fail to find a preventive. It somewhat resembles the black knot on the plum. Is the disease identical with the plum knot? Or—What is it?

I once saved a choice plum tree from attack of knot on the body, when near an inch in diameter, by carefully cutting out all the affected wood, which extended to the heart. The wound healed over, and the tree made sound growth after that. The grape knot attacks the vine usually near the crown, though, sometimes six or eight feet above, and if left alone, the sap is choked, the vine above the knot dies. It appears on branches an inch or more in diameter, and on those of smaller growth, down to that of a single year's production. Last spring I noticed a choice vine that kept its wood green to the middle of June without pushing a bud, and finally a shoot burst forth near the root. Examining the old stem, I saw a knot forming on it below the buds, and treating it as I did my plum tree, I cured it, and obtained a vigorous growth from buds above, as well as from the sprout at the base, the knot wound healing over.

But this cure is not satisfactory as a general principle, whatever may be said of a single case. Usually, before discovered, it encircles the entire vine, leaving no remedy but amputation, and I don't like to be forced into the "renewed system" in this way! What say you? What says your man of "daily rural life?" The sample I send was cut from a branch that fruited well last season and I knew not that it was doomed till to-day, when I found it diseased from near the root upward, and cut the smaller bit I send you at a distance of some ten feet from the crown. Is it an insect? Is it fungus or parasite? Or is it, like the pear blight, chargeable to—you tell what? Perhaps I should add that this grape knot is no respecter of varieties. The tender and the hardy are stricken alike.—S. Folsom, *Attica, N. Y.*

This disease is far from being a new one, for specimens identical with those you send have been received at this office from various parts of the country, during the past five or six years. But we neither know the cause of the disease or that it has any specific name. Like the black knot on the plum and Morello cherry, it appears to be of fungoid origin, sometimes showing itself on the young shoots but more frequently on the old canes or main stem. This disease is doubtless closely allied to the one which appeared in the vineyards of Europe several years ago and was supposed to be one form or stage of the *Oidium Tuckeri.* Lime and sulphur applied to the soil would doubtless be of benefit in checking the spread of this disease.

Floricultural.

THE OLEANDER.

Make cuttings six inches long of old wood and place them in shallow water until they emit roots, then pot them.

An Oleander is never so pretty as when confined to a single stem; therefore rub off all side shoots as they appear, reserving only a foliaceous top sufficient to carry on its growth. At the end of the second year we shall have a stem, say three feet high, perfectly straight and dividing at its top into three branches. If now it be permitted to grow unchecked it will soon display the loose, naked habit which so mars the beauty of the Oleander as a house plant, while it demands a space that it scarcely merits. Let us cut off these three branches to within four inches of the main stem. Each branch will at once push a verticil of three buds, so that we shall have nine branches instead of three. These, when again cut back a few months later, will again trifurcate, producing twenty-seven, and so on until a thick ball of foliage is provided that, with its clean, elastic stem and double rose-colored flowers—produced more profusely for this course of manipulation—will prove a plant more attractive than any one could suppose who has never tried this form of Oleander cultivation.. Afterwards we have only to cut it back season after season as it transgresses desired limits.

Oleanders are so far from squeamish that they will suffer the rudest treatment without resentment. We have two plants about eight feet high so closely alike that we never have distinguished one from the other. They are planted out in the spring, taken up in the late fall with all the earth that readily adheres, placed in the cellar and the ball of earth and roots covered with sand. Thus, while they are suitable for shrubberies, as single lawn specimens, or in borders of whatever description, displaying anywhere marked distinctness of aspect, they are really of no trouble whatever. If it is preferred to pot them for the conservatory or sitting-room it is well to know that the roots may be crowded into the smallest pot that will receive them, working in as much soil as possible and supplying plenty of water.

Oleanders are quite hardy. We once exposed a plant to 20 degrees for thirty minutes without injury except to the leaves. We remember a tree in Savannah, Ga., twenty feet high, growing in a court-yard, and it may be that they are hardy further North.

If a unanimity of veracious authors did not so pronounce, we should doubt that they (the *Nerium oleander* species at least) were excessively poisonous, from the careless manner in which we have pruned and handled our own specimens for ten years without conscious injury.

The accompaning little cut appeared in the London Journal of Horticulture last October.

E. S. Carman.

The Centennial.

EGYPT AND THE CENTENNIAL.

The oldest nation in history—Egypt—which has had, if it has not celebrated, several Millenials of national life, appears promptly on American shores to aid our celebration of the first Centennial of independent existence as a people. The Philadelphia correspondent of the Tribune writes that Egypt's contribution to the Centennial is already landed at New York and the Chief Commissioner is here with his catalogue ready for the printer, and nothing remains for him to do but to put in orderly array in the Exhibition Buildings the products sent. If the fair were to begin next month instead of in May he would be ready. The Egyptian Commission is composed of the following members: His Highness Prince Mohamuned Tawfic Pasha, President; His Excellency Cherif Pasha and H. Brugsch Bey. The Commissioner General, accompanied by his brother, Emil Brugsch, and M. Belmer, attaches of the Commission, will take a house in West Philadelphia and remain until the close of the Exhibition. Many of the curious and costly articles, such as weapons and ornaments from the barbarous tribes inhabiting the remote regions of Central Africa, jewels, inlaid work of ivory, precious metals, rich embroideries in gold and silver thread produced by the Arabian artisans of Cairo, are taken from the National Museum, while the best specimens of agricultural products are from the estates of the Khedive. In all, the catalogue contains over 6,000 numbers. It is in itself a mine of information about the novel and daring experiment of the Khedive in ingrafting upon a decayed and dormant nationality all the modern improvements of highly civilized Europe. Statistics are given of the farms, factories, laboratories, schools and charitable institutions that have been established since he began his remarkable efforts to awaken his country from the sleep of centuries. The new arts and industries imported from France, Germany and America, and made to take root by the will of one man, contrast strangely with the barbaric splendors in architecture and apparel, whose forms and decorations come down from the reign of the Khalifs, and with the primitive furniture and utensils of the Fellahs, unchanged since the days of the Pharaohs.

The work of preparing the exhibition began last April. Had more time been given, the Khedive would have erected a palace on the Exhibition grounds. As it is it will occupy a section of the main building.

Whenever articles were desired that the viceregal museums, farms and factories did not furnish, they were in most cases purchased. Only a very few private manufacturers and land owners contributed, so that the Khedive is almost the sole exhibitor. The expense will be half a million of francs.

In the Agricultural Department Egypt contributes a complete and admirably classified collection of the products of the Nile Valley, the Oases and the coasts of the Mediterranean and the Red Sea. The display of cotton includes specimens of the crops of the past eight years—in all 2,500 samples—with the prices they brought in Alexandria and in Liverpool. Sugar, raw and refined, is the next most important article. All the grains—wheat, maize, barley, doura, beans, peas, flax, vetch, lentils, serghum, poppy seed; a great variety of useful fibers, besides such well known ones as hemp, flax and ramie; all the woods of Egypt, in sections of trees, polished upon one side; dates, olives, preserved fruit, &c., appear upon the catalogue. The localities from which all these products come are given, and a large map of "Egypt in the Centennial Year of the American Republic," prepared expressly for the Exhibition by order of the Khedive, will enable visitors to study the geography and productions of the country at the same time. In the Agricultural Department will also be shown tobacco, indigo, chemical preparations, perfumery, Arabian honey, specimens of marbles and building stones, and many other interesting things.

CENTENNIAL NOTES.

The 17th of March next, the 100th anniversary of the evacuation of Boston by the British troops, will be celebrated by the people of that city.

It is proposed to erect in Fairmount Park, Philadelphia, near the Centennial buildings, a monument one hundred feet high, commemorative of a century's progress of our country. The design is a succession of gradually diminishing star-shaped stages, corresponding with the number of States in the Union, the original thirteen forming the base or pedestal of the rest. From the thirteenth State, and at five different intervals thereafter the stages will be increased in hight. On these designs the statues of the Presidents will appear in their regular order, from Washington to Grant.

One of the interesting features of the Centennial will be an exhibition of the process of manufacturing stamped envelopes, and arrangements for the work have been completed by the contractors, the Plimpton Manufacturing Co. of Hartford, in a conference held in New York this week between their Superintendent, M. S. Chapman, and Dr. McDonald, Centennial Commissioner for the Post-Office Department, and A. D. Hazen, Chief of the Stamp Division. A full complement of special machinery will be set up in a building on the grounds, and the envelopes will be manufactured in large numbers by workmen selected from the best skilled operators in the employment of the contractors. The paper used will be pure white, with water mark, and the envelopes will be of the ordinary letter, No. 3 size, bearing a stamp especially designed and appropriate to the occasion. Several designs of stamps were submitted, and it is anticipated that a three cent design by Mr. Chapman will be accepted, as it meets all the requirements. These envelopes will be sold during the entire period of the Exhibition at the rate, probably, of twenty-five for one dollar, and will undoubtedly be in great demand by the visitors in Philadelphia.

The Poultry Yard.

ANTWERPS, OR LES PIGEONS VOYAGEURS.

So much has been written about this class of pigeons that I cannot hope to add anything that is new. Antwerps were little known in this country until the last ten years or so, and were probably introduced by the Germans, who are very fond of them, and take great pleasure in training them. They made a decided impression upon the public mind during the Franco-German war, and during the investment of Metz, at which time, and at the siege of Paris, their usefulness in carrying messages was highly appreciated.

Belgium and France have been the principal centers for the cultivation of the flying qualities of the Antwerp-carrier. Although our country may be said to be interlaced with railroads and telegraph wires, yet there are many places off the line of travel where they may be made to serve a useful purpose. They are sometimes called Antwerps, Antwerp-carriers, or Homing-pigeons. The latter name is, no doubt, the most appropriate on account of designating the true instincts of the bird for its fondness for its home, as, no matter where it may be carried, its first instinct, on obtaining its freedom, is to directly seek its home. It takes a long time to accustom it to its new habitation. It must be confined and allowed to breed and bring up its young, and even these natural ties will not always bind it to its new abode.

My observation has taught me that this homing quality does not belong alone to the Antwerp. All pigeons partake of it in greater or less degree, although it may predominate in the Antwerp; and there is no doubt that, by reason of its physical organization, of which I shall speak hereafter; it is swifter of flight and more daring in its nature. It will fly a great distance to accomplish its object, and keep up its speed with great pluck, and seek its home with a determinateness of purpose unrivaled by any other species of the feathered or even the animal creation. To show that this homing instinct does not alone belong to the Antwerp, I purchased of a dealer, who at the time had his birds in the basement of a building in Cortlandt street, and which was always lighted by gas, an Almond-tumbler, which is known by the fancy as a toy-bird. I took it from this place, where it had been for several weeks, to my place in New Jersey, and placed it in a pen with others of its kind. The following day I came home in the afternoon and went out to see how it looked, when I discovered the window of the dove-cote open and the Tumbler gone. All the other pigeons, about ten or twelve, were there sitting on the perch and by the open window. I searched the whole neighborhood, thinking it might have gone off with the other pigeons around the place. I heard nothing of it for two weeks, about which time the former owner of the bird called at the place where I had purchased it, and stated that it had come home that night between daylight and dark, which is about twenty miles from my residence. I let out a pair of black Fan Tails that I had bred, and they flew over Newark Bay, and, after four hours, returned to me again.

The Antwerp seems to be composite in its nature. It seems to have been made up of the Volant or Cannulet or Tumblers, the Curate Francais or Smerl, the Owl or some strong pigeon possessing one blood, and the English dragoon. The Belgian amateurs do not place the slightest value on the color of this pigeon; they match them up indiscriminately; their whole aim being to get speed and endurance. The whites are studiously avoided, for the reason that they are more conspicuous as they fly as a mark for the hawks and sportsmen. The birds that have won their long distances are very highly prized at Brussels and Antwerp. Parties have refused £20 for a pair of these birds. I have been breeding from a pair of birds that have flown 400 and 500 miles, and made their 1,531 yards per minute and 52¼ miles per hour. On the Continent a very perceptible improvement in the speed of the Antwerp has been made in the last few years.

With other pigeons, I exhibited three coops of Antwerps at the Long Island Poultry, Pigeon and Dog Show; a pair of Blue Checquers, a pair of Red Checquers and a pair of Blues, with black bars across their wings, which seemed to surprise some Belgian amateurs on account of their power and beauty. They desired to know why the blues only took 2d premiums, and when I explained to them the reason, on account of a white primary feather, they at first looked surprised, and could not understand it until I explained to them that it was considered by the judge a false feather, when they laughed heartily. One of them took the birds out of the cage and remarked, in relation to its strength, "I can hardly hold it." Feel its pectoral muscles; they are as hard as iron. We care nothing about color; we want strength, pluck, endurance.

Greenville, N. J. ISAAC VAN WINKLE.

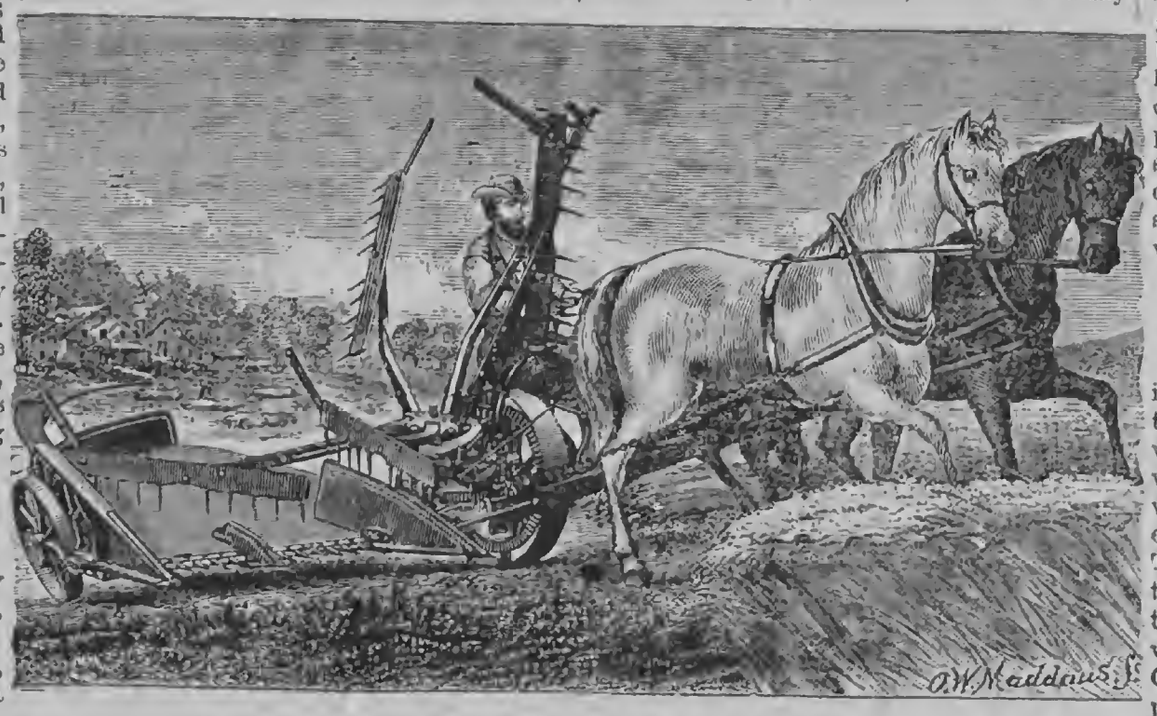
Our Premium Articles.

THE JOHNSTON HARVESTER.

The King of the Harvest Field has made a good record the past year, and occupies a correspondingly prominent position in the Rural Premium List. The New Improved Wrought-Iron Harvestor has proved itself unexcelled as a single machine, and is warranted to cut anything in the shape of small grain that a farmer can grow. The price of one of these Harvesters is $150, and such a prize is well worth the time and labor that it will require in canvassing for the Rural New-Yorker to procure it. We will send one to any agent getting up a club of 90 at $2.65, or of 150 at $2,15 each.

CAHOON'S BROADCAST SEED SOWER.

This machine is manufactured by the Geodell Manufacturing Co., Antrim, N. H. To many who cannot afford to purchase a seed drill this handy instrument will be most acceptable. Our readers have frequently seen in our advertising columns the picture of the farmer taking a morning walk with his head surrounded by a halo of golden grain. It does its work thoroughly and effectively, and will be to many the most desirable thing we offer this year. We will furnish this Seed Sower complete for use costing $10, for 15 subscribers at club rate, or 8 at $2.65.



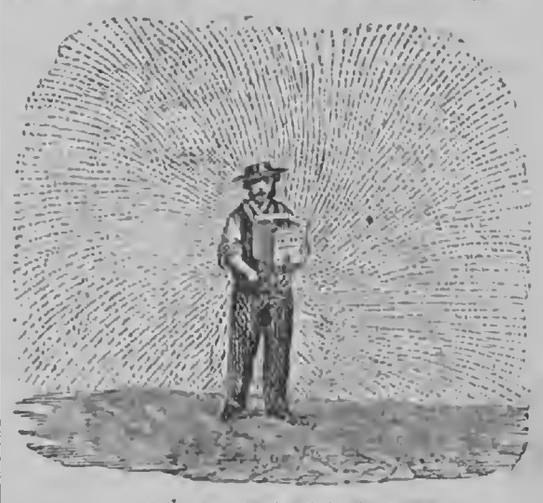
THE JOHNSTON HARVESTER.

Field Crops.

WHEAT GROWN IN BRITAIN.

The Irish Farmer's Gazette gives the following particulars about the varieties of wheat now grown in England and Scotland:

The fine varieties of wheat, such as Chiddam, Talavera, or Pearl, are delicate growers, and yield the least produce, although from their quality the grain of these wheats bring a high price. It is the farmer's interest to realize most money per acre, and he will better attain this by growing red wheats. Of these are Kessingland,



CAHOON'S BROADCAST SEED SOWER.

Hallet's Brewicks, and the Prolific Spalding, all belonging to the same class, and very large croppers; but the true Lammas red and Nursery red are by many considered preferable, the latter being a particularly saleable wheat, and by all judges considered equal to the finest white wheat for the baker.

In the best wheat growing district of the south of England, a mixture of Lammas and Nursery is much grown. The straws being of different lengths, the ears have more room, and give the mixture the character of Fenton wheat, which is perhaps the most prolific and profitable white variety in cultivation. We may here observe in regard to sowing mixtures of wheat, that produce of the first mixture may assume quite a different character if sown again. The two varieties may hybridize and produce a new variety in a partial state of development. If mixtures are sown, it is safer to mix varieties which have been grown separate.

Wheat growers in East Lothian usually get a change of seed wheat from England every year. The extra cost is more than balanced by thinner sowing, to say nothing of the superiority of the crop, which is invariably better after English seed and it has this further advantage that the crop grown from English seed ripens at least a week earlier, which is of importance in the case of wheat sown late in the winter months. Before concluding these remarks, we shall notice the special characteristics of two or three of the principal varieties mentioned above. The Nursery red, as we have stated, is much grown in the south of England, and its fine baking qualities make it a favorite in France. The grain is small; the straw very tall in soil adapted for it and likewise stiff. This wheat, from the small size of the grain, should be sown thin. Lammas red has long been a favorite variety in East Lothian. It is a tall, stiff-strawed variety, producing a large weight of straw per acre. The grain produces, fine flour, much esteemed by bakers. The Fenton is a white variety of wheat, has long held a pre-eminent position in the opinion of East Lothian wheat-growers. The peculiarity of the Fenton wheat is the great dissimilarity in the lengths of the straw. A sheaf of this grain is cared down to the band. The straw is very stiff and will stand much adverse weather.

FIELD NOTES.

Wheat-Yields in Wisconsin.—A correspondent in Outagamie county has ascertained from the threshers that in that county the varieties of wheat have yielded at the rates stated:—Diehl wheat, 34 bushels per acre; Fultz and "Russian wheat," (lately imported from Russian by a miller at the village of Neenah) each 33 bushels. The latter is a white wheat, said to be equal to the Fultz in standing the winter, and therefore thought to be preferable. The variety of spring wheat producing the largest yield was the Canada Club—33 bushels per acre. Our correspondent states that, owing to the large yield of winter wheat, a large acreage will be sown this fall.

B. F. Rice of Polo, Ill., says he grew 700 bushels of potatoes on an acre of land. These extraordinary yields are generally exaggerated in the newspaper reports; but there is no doubt that in this direction lies the future profit of potato growing. Nor are these large yields entirely incredible. We have seen hills of potatoes planted three feet apart, five of which would yield a bushel, or over 900 bushels per acre.

Pomological.

WESTERN N. Y. HORTICULTURAL SOCIETY.

NOTES FROM THE WINTER MEETING.

THE twenty-first annual meeting of the Western N. Y. Horticultural Society was held in Rochester, Jan. 5—6. There was a larger attendance than in previous years, and the fruit growers generally acted and talked hopefully, as well they might, for fruit growing has been one of the few paying industries during the business depression. A goodly number of farmers were present to see and hear, for be it known the most enterprising and successful farmers of Western New York find it to their interest to combine fruit growing with general cropping. Some of the most encouraging reports of successes in fruit growing the past year were made by farmers, many of whom have planted from five to fifty acres in apples, besides pears, peaches, grapes, quinces, etc.

Mr. P. BARRY called the Society to order on Wednesday morning and made some sensible remarks on taking the chair, referring especially to the death the past year of ANDRE LE ROY of Angers, France, and Dr. E. S. HULL of Alton, Ill.

MESSRS. ELLWANGER & BARRY exhibited, as they always do, a fine collection of fruit in season, comprising 34 varieties of Winter Pears, including not only well-known and old sorts, but some new kinds of great promise. They also had four of Mr. FOX's seedling pears from California and 14 varieties of apples. They also had a beautiful vase of flowers on the platform and some fine bouquets interspersed with the fruit on the table.

The following officers were elected for 1876:

President—P. BARRY, Rochester.
Vice-Presidents—H. T. Brooks, Pearl Creek; E. A. Bronson, Geneva; I. H. Babcock, Lockport.
Secretary and Treasurer—P. C. Reynolds, Rochester.
Executive Committee—H. E. Hooker, Rochester; J. B. Jones, Rochester; S. D. Willard, Geneva; J. S. Woodward, Lockport; N. Bogue, Batavia.
Native Fruits—J. J. Thomas, Union Springs; Charles Downing, Newburgh; W. C. Barry, Rochester; G. S. Conover, Geneva; W. B. Smith, Syracuse.
Foreign Fruits—George Ellwanger, Rochester; T. C. Maxwell, Geneva; C. L. Hoag, Lockport.
Nomenclature—Charles Downing, Newburgh; P. Barry, Rochester; J. J. Thomas, Union Springs; D. W. Beadle, St. Catharines, Ont.; Geo. T. Atwood, Geneva.
Entomology—Hugh T. Brooks, Pearl Creek; Dr. A. Merrill, Geneva; Dr. E. W. Sylvester, Lyons; Mr. Saunders, Ont.
Ornamental Trees and Plants—Geo. Ellwanger, Rochester; W. S. Little, Rochester; T. C. Maxwell, Geneva; Geo. Moody, Lockport.
Garden Vegetables—E. S. Hayward, Rochester; John Craine, Lockport; J. W. Gray, Albion.
Ornithology—George T. Fish, Rochester; H. T. Brooks, Pearl Creek; David Henry, Geneva.
Botany—W. C. Barry, Rochester; J. J. Thomas, Union Springs; C. M. Hooker, Rochester.

The Reports of Standing Committees were less full than usual. Several have yet to be prepared, and will be published first in the pamphlet proceedings. J. J. THOMAS read a very interesting essay on Beautifying Winter Landscapes, which may be done by planting trees with ornamental bark, as white birch, golden-barked willow, golden ash and red-leaved ash, all of which contrast beautifully in winter when interspersed with evergreens. There are some varieties of oaks which, when young, retain their foliage or various hues through the winter. Other trees and shrubs, as mountain ash, black alder, sweet briar, and others, hold bright red berries which are very ornamental in winter. It requires more talent and skill to make a beautiful landscape than to erect a fine building. Very many costly houses in all parts of the country are disgraced by their surroundings. A little wise forethought will, at small expense, make a great improvement in this regard.

The report on Native Fruits, by J. J. THOMAS, elicited a lively discussion as to the merits of the Wild Goose Plum. There appear to be two, and perhaps more, plums bearing this name. One of these is really valuable, resisting the curculio and bearing large crops of a medium-sized fruit of pleasant but not the highest flavor. It will ripen in the drawer if picked a little before maturity. One man in Tennessee grew 600 bushels, which he sold in Chicago in peck crates at $2.50 per crate or $10 per bushel. The earliness and fine appearance of this variety make it always salable. The general impression seemed to be that nurserymen have been too cautious about being humbugged with the Wild Goose Plum and have neglected a really valuable variety. Many spurious wild goose plums, which are nothing but the common Wild or Chickasaw Plum, have been sold for the Wild Goose; hence the complaints of it.

While discussing plums, Mr. THOMAS said he had for years found no trouble in heading off the curculio by shaking the tree and catching the little turk on sheets spread beneath. The curculios disappeared so entirely that his plum trees over-bore and were considerably injured one or two years. J. S. WOODWARD of Lockport announced that he had planted 1,000 plum trees last spring and meant to plant 1,500 more this year. He asked what varieties he should set out and what four were recommended. About twenty were named, chief among which were Lombard, Coe's Golden Drop, Reine Claude de Bavay, Washington, German and French Prune, Damson, McLaughlin and Yellow Gage.

The efforts of some tree peddlers to sell the Utah Hybrid Cherry and Utah Red and Black Currants as new and valuable varieties of fruit were appropriately rebuked. President BARRY remarked that the money wasted on worthless trash of this kind would pay for a good deal of reliable pomological information through the Press and reports of this and other societies. It is the duty of fruit growers and nurserymen to protect the public from such impositions as far as possible.

Mr. A. C. YOUNGLOVE of Vine Valley, on Canandaigua Lake, made an interesting report of operations, both successful and otherwise, in that valley the past season. Peaches have never failed to produce a crop there, and are being extensively planted. It takes three years for the trees to get into bearing, and most of them are young yet. The past winter was very severe on grapes, not entirely from the severity of the cold, but because of the dryness of the earth, which admitted frost to a great depth. Grapes were killed without regard to their hardiness. The roots were frozen and dead, while the tops at trimming time in March or April were alive. Some cuttings taken off at this time made quite healthy vines, while the parent vine died about the time for putting out its leaves. These statements elicited considerable discussion. Mr. YOUNGLOVE had been reluctantly forced to abandon the Croton. The Delaware was his main reliance, but he thought very highly of Rogers' Red grapes 15 and Salem. The only money in grapes for market is in the red varieties. All black varieties, excepting Concord, which sells under its own name, are sold by N. Y. commission men as Isabellas and at Isabella prices. Average people don't seem to understand that there is any difference in quality in black grapes. Hence it does not pay at present to grow the finer varieties. There would be money in a good, hardy and productive white grape. The Rebecca is unreliable and only fit for the amateur who wants a few bunches for table use. A good white grape would bring a high price.

Mr. CRAINE of Lockport said that with him the Delaware mildewed worst of all. The Rogers grapes escaped, and the Croton was only partially injured. He suggested that the Croton was not adapted to Vine Valley.

Mr. YOUNGLOVE made the almost incredible statement that he could detect no difference in flavor or appearance between the Salem and Rogers 15. Both are red grapes, and he liked both, but thought them almost, if not entirely, identical. There is no reason to doubt Mr. YOUNGLOVE's word for this, and Mr. BARRY and others assured the Society that Mr. YOUNGLOVE had the varieties true to name. We suggest that Mr. YOUNGLOVE's grapes, grown in the sunny Vine Valley, are over ripe before tasting, and under such circumstances the very distinct flavor of Rogers 15, suggesting, though not resembling, pine wood, disappears. There certainly is a very decided difference in these varieties at the time of ripening and before. Both are good, and to our liking a little better before they are dead ripe.

With regard to the killing of grape vines and trees last winter, is it not probable that the roots of hardy vines and shrubs are less hardy than the branches? When the ground is full of water this forms ice in contact with the root, which is thus never exposed to a temperature much below freezing. Dry earth, on the contrary, can be permeated with air far more intensely cold than ice ever is. Last winter trees and plants had no protection of an ice mat for their roots. Frost penetrated to the subsoil, reaching to the tip ends of the roots and extracting every particle of moisture. Of course the roots died, unless very hardy, under such circumstances.

Pear blight was only briefly discussed. It has been very prevalent this season, probably from injury to pear roots the previous winter. Vigorous cutting off of the blighted portions and using diluted carbolic acid on the healthy parts was the treatment recommended as promising best. If the blight is a fungoid growth, it was suggested that sulphur might destroy it.

The Codling Moth elicited a good deal of attention. Putting bandages of paper around the trees for the worms to hide in, and examining and destroying every two weeks, has proved an effectual and cheap remedy. Bandages should be applied about the first of June, folded several thicknesses and tied in the middle. It is not necessary to remove the bandages, as a heavy flat-iron, pressed around the bandage as it remains on the tree, will crush and destroy the worms. On old trees loose bark must be removed, else many of the worms will hide under that and escape. Ground should also be kept clear of weeds and other material wherein worms can hide. In winter thousands of moths hatch in apple cellars, and, if the windows are kept closed, may be destroyed towards spring before escaping to begin their work of destruction. Many more hibernate under rough bark of old trees or on the ground. Scraping the bark off in winter, and late fall or winter plowing will destroy these. The first crop of moths in spring is always a small one, as thousands are destroyed by woodpeckers, and by wet weather in winter.

The bands applied in June will kill the second crop, and, after a few years of such treatment, we may expect to see this enemy materially lessened in numbers. Scraping loose bark from old trees is first in order, and should at once be attended to. After that, plowing, or even dragging the ground will be beneficial. A drag will disturb the dry place in which the worm has ensconced himself as effectually as a plow, and once where wet can reach them in cold weather few will survive. Messrs. HOOKER BROS., on a few acres of old orchard which has been bandaged and the worms destroyed the past season, picked 1,100 barrels of fine apples entirely free from worms, which sold at an extra price, ($3 per bbl.) on account of their superior quality. Thousands of farmers, whose orchards never yield anything, except in years when apples are too plenty for the codling moth to destroy, can, by a little care and at light expense, secure abundance of good fruit in the non-bearing years. The mischief seems to be that in the odd years, when apples are abundant, worms increase so largely that they take everything the following season, when, as there is a scarcity of apples, the codling moth crop is decreased, and the result is a glut of apples—many of them worm-eaten—every other year. The codling moth is responsible for the increasing tendency of fruit to fail entirely one season and be over-abundant the next.

In discussing the planting of ornamental trees by roadsides, President BARRY advised farmers to do it as a means of beautifying their homes. They need not go to nurseries and buy expensive trees, but dig them from the woods, as suitable varieties are found in almost every neighborhood, which may be had with little expense. The sugar maple is probably the best one variety for a long line of roadside trees, but other varieties of suitable size may be interspersed. The mountain ash is beautiful in winter as well as summer; but objectionable, as it harbors the borer, and needs as much attention as an apple orchard. The elm was recommended for an isolated tree, where there is plenty of room. Its branches rise and arch over buildings in a beautiful way; but it is not suitable in a line with smaller trees, as it will hide the view of the other and spoil the effect. It is also unsuitable for planting by roadsides near cultivated fields, as its roots run a great way, exhaust the soil and injure the crop. Some lower growing trees with shorter roots are preferable. They will also make a better windbreak.

Question 5—the comparative profits of fruit growing and general farming—brought out some interesting and suggestive facts, and showed that some men, at least, knew how to make money in "hard times." Mr. WOODWARD of Lockport said that successful fruit growing demanded the same skill and enterprise as successful farming. Men are not to think because they have planted an orchard that they can leave it uncared for and it will make them rich without effort. Still there are many notable instances of great success in fruit growing. In Niagara County it is found that generally the farmers with good orchards have long pockets, while those who depend upon grain crops exclusively can hardly pay their way. An acquaintance of his, named PETER E. MILLER, had a farm of 100 acres, with 15 acres in fruit. From this fifteen acres the sales have been far heavier than from all the rest of the farm. The orchard, mostly greenings and Baldwin's, is now fairly in bearing, and well cared for. In 1872 sales of apples were $5,000, in 1874, $2,000, and in 1875, $6,200. Mr. WOODWARD, some years ago, bought a farm, at $42 per acre, with a young orchard on it, sold $14,000 worth of fruit, and sold the farm at $118 an acre. He had set two orchards and sold them. Now he was planting an orchard and meant to keep it. A peach orchard in his neighborhood averages $125 profit per acre every year, counting bad years with good. Knew a farm of 176 acres which has 30 acres orchard, and the orchard yields more profit than all the balance of the farm. He did not believe there was any limit to profitable production of fruit in W. N. Y. Some years there would be a glut, but, on an average, it would pay. Had set out peaches, pears, apples, within the past two years. L. SHARP of Lockport, from an acre and a-half of orcharding, in 1374, sold $28 worth of fruit. In 1875 sold $898.88. From a young orchard of 40 acres, planted 13 years ago, he sold 9 bbls. per tree this last year. The trees are well cultivated through the summer; land not cropped, and the codling moth kept down. Have trees 11 inches in diameter, one foot from the ground. Would plant new apple orchard 33 x 40 feet, to give each tree plenty of room. In Niagara County, when a farm is for sale, the first question is: "How many acres of orchard are there on it."

Mr. RATHBONE of Genesee Co., reported that from ten acres of dwarf pears, planted 14 years ago, the sales to date have netted $10,694,44, and interest on profits amounts to $1,992, making a total profit of $12,686,44. The profits in 1874 were $72.80, and in 1875 $2,150.38. JULIAN REED of Oakfield, Niagara Co., sold last year, from 99 Duchess pears, $1,905. Nearly all these trees have taken root on their own stock.

D. E. ROGERS of Wheatland, related his experience with peach trees. Had a peach orchard planted between rows of young apple trees, on ten acres. Half of it is just coming into bearing, and from this half he sold, in 1874 and in 1875, $3,000 worth of fruit per year. The prospect is now good for an equal crop next year. Sold peaches at $1 to $1.50 per basket in Rochester markets.

FOSTER UDELL of Sweden was called out. Grew no fruit but apples for market, but apples were much more profitable than ordinary farming. Have a farm of 200 acres, with 55 acres orchard, 800 to 1,000 trees, have been planted 20 years, and 1,100 more were planted in 1861. From these the sales have been five times as great, for a number of years past, as from all the rest of the farm. Believes in thorough cultivation of orchards, but without cropping them. The fruit crop pays better than any other, and trying to grow any other is at the expense of that. Would plant trees wider apart than is common, to give them room to grow.

T. S. HUBBARD of Fredonia gave the produce of one acre of Concord grapes, planted ten years ago, and which has borne eight crops. In 1867, first crop, 1 and 2 tons, net $350; 1868, 3 tons net $400; 1869, 5 tons net $650; 1870, 2 tons net $300; 1871, 3 tons net $300; 1872, 3 tons net $240; 1873, 3 tons net $250; 1874, 3½ tons net $250; 1875, 2 tons net $200. Of late years the price of grapes has been low; but they still yield a good profit at low prices. The average of 8 years is $350, with ordinary soil and no manure.

DR. SYLVESTER of Lyons, said that 20 years ago he bought a farm of a German, who had tried in vain to pay for it. There was a mortgage of $1,500 on the farm, and the German had tried many years to pay it, but could only make the interest. The first year Dr. SYLVESTER occupied the farm he planted 1,100 trees of various kinds—a good many pears, with some apples and other fruits. The sales of fruit from that farm have averaged, per year, more than the purchase price of the land, and have long been much above that amount.

President BARRY, in closing discussion on this subject, said he never doubted that fruit growing would always be profitable in Western New York. It was within twelve hours of the great markets, and its soil and climate were better adapted to fruit growing than those of many other sections. It is true that many farmers think fruit does not pay, and no doubt in some cases they are right. A few trees left uncared for, and bearing a few barrels of wormy fruit only when apples are a glut, do not pay; often the fruit hardly pays for gathering. Fruit must be cultivated as a business, not necessarily excluding other farming, but in connection with it. A few acres of orchard well cared for and the codling moth destroyed by careful attention will not cost a great deal of labor, and will pay well on any farm. Farmers who have only a few barrels of apples cannot get so good a price per barrel as those who have large crops. For one reason the fruit is rarely of as good quality.

It was left optional with the Committee to hold an exhibition of Roses next June or not, as was deemed best. The exhibition last summer was creditable every way, but, owing to bad weather, did not pay expenses, and the deficit was paid by subscription. A further sum of $100 was raised to pay the Secretary for his services in getting out a report, a sum well earned and worthily bestowed.

Mr. D. WINO & Co. of Rochester exhibited specimens of fruit and Hubbard Squash excellently preserved by the ALDEN process. A perforated barrel stave was also exhibited and attracted much attention among fruit shippers. It gives the barrels perfect ventilation and at an expense of not more than four or five cents each—much cheaper as well as better than boring holes through by hand, as is often done in shipping perishable fruits.

It was voted that Western New York should be represented at the Horticultural show in the Centennial Exhibition. The following Committee was appointed to attend to the collection and forwarding of fruit, securing space, &c.:

Monroe—P. Barry, Chairman; H. E. Hooker, E. A. Frost.
Wayne—L. T. Yeomans, John M. Mackie.
Ontario—E. A. Bronson, S. D. Willard.
Chautauqua—T. S. Hubbard, G. E. Ryckman.
Genesee—N. Bogue, Norman Drake.
Orleans—J. W. Gray, V. Bogue.
Niagara—I. H. Babcock, J. S. Woodward.
Onondaga—W. Brown Smith, W. F. Will.
Wyoming—H. T. Brooks, E. C. Sherman.
Yates—A. C. Younglove, Dr. Spence.
Steuben—T. M. Younglove, Judge Larrowe.
Livingston—E. P. Mack, M. M. Brooks.
Cayuga—E. G. Pierson.
Erie—Godfrey Zimmerman, John P. Long.

THOS. H. HORWOOD, Janitor of the City Hall, had a conservatory fitted up in beautiful style with plants and birds of various kinds in the room adjoining that in which the Society met. It was much visited by members. The Society voted thanks to Mr. HORWOOD for his courtesy.

The time of meeting was changed to the fourth Wednesday of January, and about 1 P. M. of Thursday the Society adjourned *sine die*, having enjoyed a most instructive and profitable session.

Diary of a Ruralist.

DAILY RURAL LIFE.

From the Diary of a Gentleman near New York City.

A HEAVY SHOT FROM TENNESSEE.

Jan. 4.—The Editors of the RURAL NEW YORKER are in receipt of the following letter, which has been called out by some remarks of mine that appeared a few weeks since in this department. Not being disposed to shirk any responsibility or to deprive my opponent of fair play, I give his communication entire:

EDS. RURAL NEW-YORKER:—In your issue of Nov. 27 I notice that I am charged with egotism and direct falsehood. If the charge had not been made by a "gentleman" I would not condescend to notice it. The circular which "A Gentleman near New York City" criticises so severely might, I confess, have been worded differently. It was intended to say that I *found* the plant and determined to offer it for sale. Until I offered it for sale, I had not seen it advertised by any of the professional gardeners, notwithstanding I am in constant correspondence with a great many.

My circular was sent mostly to professional gardeners, and the botanical name was given in each circular. Will any one suppose that the botanical name would have accompanied the advertisement if *deception* had been intended? I had no intention of robbing Mr. LINNE or any other man of anything due them. The "gentleman" sneers at the idea of an *agave* having *bulbous* roots. I desire to call his attention to the Gardeners' Monthly, edited by THOMAS MEEHAN. On page 90 he will find the following:

"*Agave Virginica.*—J. C. G., Knoxville, Tenn., sends some "bulbs" for a name, which we give as above. The plant is well worthy of cultivation—not for its beauty (greenish-white flower), but for its curious structure and very sweet odor. It is closely allied, botanically, to the tuberose, and its fragrance, though not as great as the tuberose, is still suggestive of it. We have been told by a Wilmington correspondent that a variety of the same plant has been found in South Carolina, with leaves spotted with red. There is no doubt much good material for ornamental gardening to be found in these wild plants."

The plant propagates almost identically as the tuberose, putting off offshoots at the bottom of the bulb. It is too much to say that when a man has seen one *Agave Virginica* plant that he has seen the whole family. There are several varieties of *foliage*.

"A gentleman" says that an "*agave* having *bulbous* roots is certainly something new in science." It is possible (barely so, I admit) that *he* does not know everything. If he wishes to discuss the subject *scientifically*, I will refer him to Mr. MEEHAN. Your correspondent is disposed to be witty at my expense and speaks of me as the "oldest man alive." It is true that the days of my childhood have passed, and that I have long been grappling with the stern realties of life. I am not too old, however, to remember the teachings of the fireside and the Sunday-school, where I learned that to *be* a gentleman is a very different thing from being *called* one. Your "gentleman" may be a brave man, but he certainly discounts his manliness when he charges falsehood upon an entire stranger without sufficient cause. Possibly the charge would not have been made if the parties had been face to face instead of hundreds of miles apart.—JOHN C. GUNN, *Knoxville, Tenn.*

You confess at the outset that the circular referred to "might have been worded differently," all of which is very true, and had it been worded in accordance with the truth I should have found no fault with it. But I have only to deal with the circular as it is, and not with what it might have been; and as you distinctly claim to be the "*original* discoverer and cultivator of this plant," I suppose you mean what you say in this case as well as when offering the plants for sale.

You start out by calling this a "New Flower," and while I admit that the term is subject to some slight variation in its application, it can hardly be said that a plant well known to science for nearly one hundred and fifty years can be called "new" by any one having the least regard for the meaning of words or truth. It also appears that you did not know the name of this wonderful plant until it was given in the Gardeners' Monthly. If it was new, how came it to have a name, and how did the Editor of the Gardeners' Monthly know what it was?

Now, you distinctly assert in the printed circular I received some weeks since that the *Agave Virginica* is a "new flower" and was "discovered a few years since," and further, that you are the "*original* discoverer;" and I claim that neither of the above assertions are true. I have before me a book published in 1743 by JOHN CLAYTON, on the Flora of Virginia, and in the second part, page 152, the *Agave Virginica* is not only described, but also the variegated-leaved variety which the Editor of the Gardeners' Monthly mentioned as lately found in South Carolina by his friend. In THOMAS WALTER'S Flora Caroliniana, published in 1781, page 121, both the species and variety are again mentioned and described; in fact, they are referred to in nearly all the old botanies, from LINNE'S *Hortus Cliffortanus*, published in 1737, down to the last editions of Dr. GAY'S botanical works published in New York City.

If you are the *original* discoverer of *Agave Virginica*, as asserted in your circular, then you must have been prowling about upon this earth before 1737, else the claim is false.

This plant has not only been described in hundreds of volumes, but an occasional figure of it has been given to aid the novice in identification. In CURTIS' Botanical Magazine, 1808, there appears an excellent figure of this plant, accompanied by a popular description of the same in the American Agriculturist. The plant is neither new to science nor cultivation, for it was introduced into the Kew Gardens, England, by JOHN CREE in 1765, only one hundred and ten years ago.

There is still another assertion in your letter which is not exactly clear in a scientific point of view. You say, "It is too much to say that when a man has seen one *Agave Virginica* he has seen the whole *family*." Now, will you be so kind as to tell me what the "*Agave family*" is, and whether you got that name with the rest of your science from the Gardeners' Monthly? If my memory is not at fault, a MICHAEL HOEY of Knoxville, Tenn., offered this same plant in 1874 under the name of "American Tuberose;" therefore you are not alone entitled to the credit of disseminating the old and well-known plant, even from Tennessee.

Now, please bear in mind that I have not said one word against the plant under discussion, or the price charged for specimens or seeds, but it is the claim of being its discoverer and only cultivator which are offensive to me, as they must be to every man who knows anything of the Flora of North America. There are very good reasons why such plants as the *Agave Virginica* are not offered in florists' catalogues, and one is, their merits are not sufficient to create a demand, and another is that they are far too common over a region of country extending from the Atlantic Ocean to the Missouri River to be considered a rarity or really worth offering for sale.

FORESTRY TWO HUNDRED YEARS AGO.

Jan. 6.—While looking over the titles of the books upon my library shelves this evening, without any special object in view, my eyes rested upon the figures 1675, and the thought of the year just closed ending in the same two figures reminded me that two hundred years had elapsed since the author of this book committed his thoughts to paper. I have older books than this, but none on the same subject which comes so near an exact two centuries since publication, for the date of preface is Nov. 16, 1675. But let us look at these pages, which are slightly yellowed by time, but the print is as clear as though the sheets were struck off but yesterday. First comes the long title beginning with "The Manner of Raising, Ordering and Improving Forest Trees, etc., etc., by MOSES COOK, Gardener to the Earl of Essex, Cashiobury, England." If we look further in this work we shall find very little that is of especial interest to us at the present day, beyond the fact of knowing how much was known of forest tree culture two centuries ago. Strange as it may appear, MOSES COOK had to contend with much of the same kind of quackery in horticultural matters as is continually coming to the surface at the present day.

Men in those days had no doubt asserted that sweet and sour apples were produced by inserting parts of two buds or cions, or making the stems from two seeds unite by compelling them to grow up through a tube; but our author puts all this stuff down as nonsense. Watering seeds and plants with colored liquids in order to change the color of the flowers is also put down as another error. Boring holes in the stems of trees and filling them with any substance to change the flavor of the fruit is, he says, a great fallacy. Still, the constant denouncing of this process for two hundred years has not driven it out of existence, for every few weeks or months I notice the report of some quack in pomology who has saved his plums from insect depredations by boring holes in the stems of his trees and filling them with sulphur, or perhaps by driving rusty nails into the stems. He also tells us that the idea prevalent among the country people then, as now, that the sap of trees in winter descends to the roots, is an error; in fact, our author seems to have possessed a goodly share of common sense, even though he lived two centuries ago.

America was a wilderness when Mr. COOK was urging upon his countrymen the importance of raising forest trees, and although he knew nothing of our great prairies, "big trees" of California, or of railroad ties and telegraph poles, still I find it pleasant to have a little chat with him in this our Centennial year, over the occurrence of which we feel so very proud.

I am thinking who or what kind of a man will be looking over my copy of MOSES COOK'S book one hundred years from now, if it should escape destruction so long? Perhaps his attention will be called to it by reading this page of the RURAL NEW-YORKER during our bi-centennial. Who knows? Yes, who knows what may be one one hundred years hence?

Hygienic Information.

THE CONTAGION OF SCARLET FEVER.

HALL'S Journal of Health has the following suggestive and valuable article on this subject: Since none of our common diseases is more dreaded than scarlet fever, it is important to know what can be done to prevent its diffusion. To this end the following conditions should be observed: Let the patient be assigned an upper chamber, freely ventilated, comfortably warm and reasonably cool. There should be no carpet on the floor, no curtains about the bed, and no cushioned and upholstered chairs or sofas. Use an iron bedstead, and if possible let the bedding be destroyed by fire as soon as the patient is so far recovered as to mingle with the other members of the family. The handkerchiefs which he has used should be burned. It is better to furnish bits of old cotton or linen in place of handkerchiefs, that each piece, as soon as soiled, may be removed and destroyed. The spittoon, or other vessel which receives the expectorations, should contain a little water with carbolic acid or chloride of lime. One or the other of these disinfectants must be used freely about the room. An indispensable article for the comfort of the patient is an earth-closet. There are several kinds in use, but, as far as we have observed, the simplest and cheapest is the best. Common garden soil, perfectly dry, should be used, or sifted coal ashes. Either of these substances will readily deodorize the intestinal discharges. A small quantity of sulphate of iron—copperas—if added to the soil or ashes, will serve as an excellent disinfectant.

Nurses, and others who come in contact with the patient, should frequently wash their hands with carbolic soap. Clothing taken from the patient, if not burned, should be allowed to remain in water containing one of the above named disinfectants two or three days before being washed.

These simple suggestions, if followed, would result in a greatly decreased number of cases of scarlet fever; and if the means proposed were generally adopted, we believe that in a short time the disease would be effectually "stamped out."

We are aware that in many families the course we propose is impracticable. They have not the room, nor the means. But they can follow some of our directions. They can ventilate the sick-room and use disinfectants.

It is possible that physicians, in treating this disease, neglect, sometimes, an important part of their duty. They do not enforce, as they ought, the simple regulations by which so much may be done toward destroying the contagion.

MILK AS A MEDICINE.

THE American Journal of Medicine, St. Louis, says:—"This article, once looked upon with distrust, has now become a valuable agent in the treatment of disease, and is, on all hands, recommended by practioners of medicine as being a safe and reliable article in the list of curables. Given warm, it is declared to be almost a specific in diarrhœa, stomach ache, incipient cholera and dysentary. It is also pronounced invaluable in typhoid fever. 'We believe that milk nourishes in fever, promotes sleep, wards off delirium, soothes the intestines, and, in fine, is the *sine qua non* in typhoid fever.' This gentleman further says: 'In scarlet fever give all the milk the patient will take, even during the period of greatest fever; it keeps up the strength of the patient, acts well upon the stomach, and is in every way a blessed thing in sickness.' The authorities in these cases say that the milk should never be boiled, as that unfits it for use."

In "Practical Dairy Husbandry," (by X. A. WILLARD, A. M., and published at the RURAL office,) is an excellent chapter on "The Use of Skimmed Milk as an Exclusive Diet in Disease," which gives, from medical and other authorities, several interesting cases in which persons were cured of various and dangerous diseases by the use of milk. Those of our readers interested should refer to Prof. WILLARD'S work and carefully peruse what is therein said and quoted upon the subject.

DISEASE CAUSED BY THE PASSIONS.

PROF. R. W. RICHARDSON, in an article upon "Induced Disease from the Influence of the Passions," in the Popular Science Monthly, says that of all the passions, as anger, fear, hatred, grief, acting most severely upon the physical life, the first is the most injurious. "He is a man very rich indeed in physical power," says the author, "who can afford to be angry." The effect of rage upon the heart is to produce a permanent disorder and irregular motion, as is well known. This sometimes is so severe as to cause instant death, and is more to be avoided than almost anything else by persons having organic diseases of the heart."

Of the effects of intense mental excitement attending "revivals" he says:

"Probably few people who encourage or take part in what are known as revivals have any idea of the cerebral disorders produced by these seasons of unnatural mental excitement. The revivalist being a man of strong physical organization, passes through the ordeal unharmed, but heart disease of some sort, hysteria, all kinds of nervous diseases, and even insanity, too often follow in his wake. Particularly is this the case among children, whose sensitive nerves are excited to the highest pitch by the vivid pictures of eternal misery or bliss painted by the skillful preacher."

Domestic Economy.

THE POT ON THE FIRE.

THERE is one mode of preparing food in general use in many parts of Europe which we should do very well more generally to adopt; that is, "gentle simmering." In every or almost every French household there is the *pot au feu*. This permanent "pot on the fire," after the manner of the old-fashioned "digester," occupies a quiet little corner of the stove or fire place. It can hardly be said to boil, but it simmers on gently, for hours. There it is the receptacle of many a little bone, whether the trimmings of poultry or butchers' meat. It matters not, every little stray fragment of wholesome meat finds its way there. A bit of liver is considered an immense improvement; and any vegetables that happen to be about add to its pleasant flavor, whether the tops of celery, Jerusalem artichokes—which, par excellence, make it delicious—or otherwise carrots, turnips, leeks, etc. But supposing it were to be made altogether of fresh materials—which, indeed, in France is rarely—this would be the proper recipe: Put a gallon of water into a pot; put into this either three or four pounds of shin of beef, or any similar thing. Add to this an onion or two, or some leeks, carrot or other vegetable, three or four teaspoonfuls of salt, one of black pepper, three cloves. Give it one boil up; skim carefully. Now cover the pot closely, and let it cook gently, for four hours at least. About every hour throw a wineglassful of cold water into it, to make it clear. Taste; it may require a little more salt and pepper, according to taste. Pour this soup over toasted crusts of bread. Both soup and meat will be found delicious. The whole secret of this lies in the gentle simmering in a covered vessel, whereby the flavor is wholly preserved, and nothing is lost. A bullock's head so cooked is excellent.

BOTTLING CIDER.

A WRITER in the New England Farmer gives this advice to bottle cider that will keep sweet and fine for years, and its excellence is endorsed by the editor:—"Leach and filter the cider through pure sand, after it has worked and fermented and before it has soured. Put no alcohol or other substances with it. Be sure that the vessels you put it in are perfectly clean and sweet. After it is leached or filtered, put it in barrels or casks filled, leaving no room for air; bung them tight and keep it where it won't freeze till February or March, then put it into champagne bottles filled, drive the corks and wire them. It should be done in a cellar or room that is comfortable for work. The best cider is late made, or made when it is as cold as can be and not freeze."

GOOD BLACK INK.

A GENTLEMAN way out in Idaho says:—"Good black ink is not easily obtainable here, and the trash that passes for the genuine article is sold at fabulous prices." For his benefit and others similarly situated, we repeat a recipe taken from the New York Tribune. To one quart of strong decoction of logwood, well strained, add three ounces of blue galls in coarse powder, twelve drams sulphate of iron, one and one quarter drams acetate of copper, twelve drams of well ground sugar, one and one-half ounces of gum arabic. Set it over the fire till it begins to boil, then set it away uncorked till it has turned black enough; add a few cloves to keep out the mold. It is a real pleasure to open a letter and find a clear, legible chirography, in ink of a decided color.

WORCESTERSHIRE SAUCE.

THE Drug, Circular and Chemical Gazette gives the following recipe for making LEA & PERRINS' celebrated Worcestershire Sauce:

White vinegar, fifteen gallons; walnut catsup, ten gallons; Madeira wine, five gallons; mushroom catsup, ten gallons; table salt, twenty-five pounds; Canton soy, four gallons; allspice powdered, one pound; coriander, one pound; mace, eight ounces; cinnamon, eight ounces; assafœtida, four ounces dissolved in brandy, one gallon. Boil twenty pounds of hog's liver for twelve hours with ten gallons of water, renewing the water from time to time. Take out the liver, chop it, mix it with water, and work it through a sieve; mix it with the sauce.

"PROGRESS AND IMPROVEMENT."

MOORE'S RURAL NEW-YORKER,

A NATIONAL ILLUSTRATED

RURAL, LITERARY AND FAMILY NEWSPAPER.

D. D. T. MOORE,
Founder and Conducting Editor.

WM. J. FOWLER, ANDREW S. FULLER,
Associate Editors.

HENRY S. RANDALL, LL.D., Cortland Village, N. Y.
Editor of the Department of Sheep Husbandry.

X. A. WILLARD, A. M., Little Falls, N. Y.,
Editor of the Department of Dairy Husbandry.

G. A. C. BARNETT, Publisher.

TERMS FOR 1876, IN ADVANCE,
INCLUDING POSTAGE, WHICH PUBLISHERS PREPAY.

Single Copy, $2.65 per Year. To Clubs:—Five Copies, and one copy free to Agent or getter up of Club, for $13.40; Seven Copies, and one free, for $17.20; Ten Copies, and one free, $21.50—only $2.15 per copy. The above rates *include postage* (under the new law,) to any part of the United States, and the American postage on all copies mailed to Canada. On papers mailed to Europe, by steamer, the postage will be 85 cents extra—or $3.50 in all. Drafts, Post-Office Money Orders and Registered Letters may be mailed at our risk. ☞ Liberal Premiums to all Club Agents who do not take free copies. Specimen Numbers Show-Bills, &c., sent free.

ADVERTISING RATES:

Inside, 14th and 15th pages (Agate space)	.60c.	per line.
" 18th page	.70	"
Outside or last page	1.00	"
Fifty per cent. extra for unusual display.		
Special Notices, leaded, by count	1.25	"
Business "	1.50	"
Reading "	2.00	"

Discount on 4 insertions, 10 per ct.; 8 ins., 15 per ct.; 13 ins., 20 per ct.; 26 ins., 25 per ct.; 52 ins., 33⅓ per ct.

☞ No advertisement inserted for less than $1.

SATURDAY, JANUARY 22, 1876.

TO THE RURAL'S CORRESPONDENTS.

Our regular contributors and frequent correspondents are reminded that we always prefer *seasonable* articles,—and, as much of the matter for the Rural is prepared and put in type for ten days to two weeks in advance of the date of the paper in which it appears, the early reception of contributions is necessary to secure timely publication. We frequently receive practical articles just too late to be rendered useful. And the same is occasionally true of literary contributions. As instances in point, we were favored with several Christmas and New Year's stories and poems a week or two after those happy anniversaries occurred. Therefore, please send all articles intended for a particular time or season promptly—in advance. And pray don't write in detail about hoeing, hay-making and harvesting in Winter, nor about wintering stock, maple sugar making, etc., during the Summer solstice. "There is a time for all things," and he who follows the hint in writing for the Agricultural Press will generally receive thanks, and his articles the baptism of print.

We are always glad to receive timely and suggestive articles for either our Practical or Scientific departments; also, the results of observation, experiments and experience in any branch of farm husbandry, horticulture, gardening, etc., at any season—for such contributions are usually available or will keep without spoiling. We want practical, intelligent and sensible men and women to write for the Rural—to give us the cream of what they know about rural and domestic affairs. Among our readers are, we believe, a myriad of this class, scattered throughout the various States and Territories of this now Centennial Republic and the adjacent British Provinces wherein the Rural circulates. How many of these will kindly send us such facts, suggestions, etc., as will impart their knowledge to others?

Another thing. The numerous applications we are receiving from persons who wish to become regular paid contributors to the Rural constrains us to give here the substance of a printed circular which we have very frequent occasion to use, as follows:—"Your favor has been received. Our list of Editorial and other paid Contributors is so large, and so much more expensive than formerly, that we cannot afford to make additions, at least for the present. Hence we return your MSS., as we are almost daily doing that of other applicants to contribute to the Rural New-Yorker. It is proper to add that, in many instances, our disposition exceeds our ability to respond favorably—in which cases we sincerely regret the necessity of saying Nay in regard to the acceptance of contributions."

If writers on literary topics—those who furnish stories, poems, etc.,—will bear in mind that most of our pages are devoted to practical and scientific subjects, they will readily see that it is possible for us to accept and publish only a limited number of sketches and articles for our miscellaneous departments. Indeed, we are obliged to decline more than a moiety of the literary contributions received, and many that are accepted have to be pigeon-holed for months before publication.

Once more, and finally. All who write for the Rural, whether paid or voluntary contributors, will please remember to *boil it down*—to be as brief as may be, omitting all superfluous preface or circumlocution, and giving the wheat without the chaff. We wish to make every page, column and paragraph of this paper *tell*, and in order to do this we must avoid long stories as much as possible. Repeating from a former volume, we say,—Let us hear from you, good and wise friends, but we beseech you to help us in our efforts to get at the soul of wit—brevity! Pray "be short."—*condense*—but, Write! And in writing please make your chirography as plain and legible as convenient. Take a little pains, write with pen and ink, and note that we prefer that you write only on one side of the paper. Items intended for publication should be sent detached (or so written that they can easily be separated) from business communications. The name and address of the contributor should always accompany manuscript—not necessarily for publication, but as a protection to the Editor against deception or plagiarism.

GROWTH OF THE U. S. SINCE 1870.

Fifteen of the thirty-seven States had a State Enumeration in 1875, and in eight of these the tables of population have been prepared for publication. It is almost a pity that we did not have a general enumeration, throughout the country, so that our *status* in the one hundredth year of national existence could be known. The returns show a gratifying increase in population, and, as compared with the U. S. Census of 1870, give the following results:

States.	1870.	1875.	Increase
Kansas	364,399	533,373	168,974
Louisiana	726,915	857,039	130,124
Massachusetts	1,457,351	1,651,902	194,551
Michigan	1,184,059	1,344,031	159,732
New Jersey	906,096	1,026,502	120,406
New York	4,382,759	4,705,208	322,449
Rhode Island	217,353	258,239	40,886
South Carolina	705,606	923,447	217,841
Total	9,544,538	11,299,741	1,355,203

New York holds its own as the Banner State in population; but the increase here has been only a little more than seven per cent., while for the average of the eight States it is thirteen. Most of the increase in New York is in its cities and villages, and the Rural and Agricultural population has apparently no more than held its own, if it has done that. In some of the Western States there is an increased Agricultural population, showing that the soil, even with defective farming, has not been occupied to the limit of profitable production. It is quite probable that one or two States not in the above table may, ten, twenty or thirty years hence, outrank New York in population. Illinois and Iowa each excel New York in Agricultural resources, while Missouri possibly excels all others in her combination of Agricultural and Mineral wealth and facilities for extensive commerce.

If the States above enumerated show the fair average increase of population for the whole country, the United States will have in 1880 a population of forty-nine (and possibly fifty) millions.

NOTES FROM WESTERN NEW YORK.

During a visit to Rochester, to report the winter meeting of the W. N. Y. Hort. Society, we found the fields bare and weather warm and pleasant. Wheat on the ground made a poor growth last fall, but has improved materially and promises well. There has thus far been little snow and less cold weather than usual—enough frost to be "hard" on wheat, only somehow bad weather does not do so much injury early as later in the season. What is called "winter killing" of wheat in ordinary seasons is more often destruction from cold and drying winds on the wheat plant in April or May, after frost has thrown the roots to the surface. For several years we have had dry springs—favorable for getting work done, but very injurious to wheat. The absence of snow early in winter leads us to hope that the ground will be well covered hereafter. The season is now advanced so far that long continued cold weather need not be expected. Sunday, Jan. 9th, the thermometer near Rochester showed sixty degrees above zero, and the weather had been even warmer than that. There was no ice in the lakes, very little anywhere, and it is solid blocks of ice drifting eastward on the lakes which make Western New York spring months cold and disagreeable. There is plenty of time for severe weather, and possibly for some extremely cold; but the lack of foundation makes it likely that it will not be long continued, and an early spring is extremely probable.

Prices of all produce are low, and many farmers are hard pushed to find money to pay taxes. Happily, however, these are lighter than usual for farmers in Monroe Co. this year—partly from decrease in State tax and partly because the towns have for the first time apportioned taxes between the City of Rochester and the county on an equitable footing, 60 per cent. to the city and 40 to the towns is this year the rule, and the proportion pretty fairly represents the actual distribution of wealth between the two. The city representatives are generally more inclined to extravagant legislation than those of the towns, and this increased tax rate will have a good effect in making them careful.

A great many potatoes have been sold at ruinously low prices, and thousands of bushels more remain to be sold. Many farmers are discouraged and will plant no more except for their own use, and nearly all will curtail operations considerably another year. Fewer acres, larger crops and better prices will yield more profit, and without better prices fewer acres will entail less losses. On the other hand, a friend of ours, an intelligent and successful farmer near Rochester, informed us that last year he grew potatoes for 12½ cents per bushel. This is a very interesting subject in seasons when potatoes are down nearly as low as that, and we are glad to be able to state that he has promised to inform readers of the Rural New-Yorker how it is done.

Hosts of friends from all parts of Western N. Y., gathered to attend the meeting of the Horticultural Society, greeted us at Rochester with many congratulations on the Rural's excellence and progress.

Our friend, Mr. Darrow, at the Rochester Agency for the Rural, No. 67 East Main street, was in good spirits and spoke encouragingly of the Rural New-Yorker's increased subscription list in Rochester and vicinity.

RURAL NOTES AND QUERIES.

The Rural's Advance in 1876—Has thus far been consonant with the progress and prosperity anticipated during the Centennial Year. Our circulation is being largely augmented throughout the country, while the Press is saying kind things about the paper and the people working for it successfully. Many Agent-Friends have already sent us double the usual number of subscribers, while not a few have trebled and quadrupled their former lists. And moreover its friends talk and write most appreciatively of the Rural. For example, that good old recruiter for the Rural Brigade, Col. H. R. Porter of Erie Co., Pa., writes:

"Here are a few more names for the Noble Old Rural, whose flag still waves and whose banner has never struck to rings, cliques, knaves, fools, tools, nor those who would, cheat, rob or crush down the farmer. O, how it has labored and toiled to watch over the interests of the tiller of the soil! God bless it, and long may its banner wave!"

In remitting for 1876, Mr. W. F. Baumann of Knoxville, Tenn., says:—"You say truly '*The* Paper for the People,' and I wish every farmer would take it. *The information contained in a single number is worth a whole year's subscription to any one.* I am not a farmer, but I will not do without the Old Rural as long as I can raise the means to secure its continuance."

Mr. John Harral, of De Soto Co., Miss., in a letter remitting for a copy of the Rural for his daughter, says:—"My estimate of your paper is higher every year,—and to say that I am pleased with it is the least that I would speak as praise, and I intend after awhile to tell you more fully my good opinion."

Miss (or Mrs.) Mary L. Ware of Hampden Co., Mass., writes:—"Five years ago I thought the Rural was as good as it could be, but it is improved, and I am now certain it is the best farmers' and household paper ever published."

—These greetings from Pennsylvania, Tennessee, Mississippi and Massachusetts must suffice for the present. But—thanks to our friends everywhere for their good words and generous exercise of influence!

Advertising for a Wife.—It is no matter of doubt that a great many matrimonial engagements originate in local Grange meetings, where young people of both sexes are brought together in pleasant social relations. It is not supposed that the more formal sessions of State Granges can be utilized as promoters of matrimony. This, however, appears to have been done in Maine, as the Bangor Whig pleasantly tells the following story:

"During the sessions of the State Grange, P. of H., in this city, the place of meeting was filled with farmers, their wives and fair daughters, and some young bachelor farmers who, of course, were anxious that the fair damsels should know that they yearned for some one to make brighter the farm-house for them, superintend the dairy and darn the stockings of their spouses. But just how to pass round this information to the young ladies wasn't known. Finally it came about in one instance in the following manner:—The roll was called and those who brought their wives and daughters were asked to answer 'Here, and wife,' or 'Here, wife and daughter,' as the case might be. A large number of names had been called and every one turned to see who answered, and each time the 'here' was followed by an addendum, but at last came a name (we'll call it John Smith) and the young ladies all turned their eyes to where a tall, angular, young farmer sat. He turned red, stammered, coughed, and finally recovering himself, answered, 'Here and single;' and after the session they made the young man unhappy by accusing him of advertising for a wife."

Local Centennial Histories.—Onondaga Co., in this State, has inaugurated a movement for a local history of the county as part of its Centennial celebration. The Board of Supervisors has appointed a committee of two citizens from each town and ward to collect material, which will be arranged by some competent person in a local history. The Agricultural and Horticultural development of the country, its manufacturing establishments, its political history and sketches of notable professional men would each afford interesting and instructive matter for a pamphlet, and each department should be allotted to men specially adapted for the work. Collected in book form, these histories would be found increasingly valuable as the men familiar with our early local histories pass away.

Horse-Racing at Fairs.—The Patrons of Husbandry in Ohio have found a new use for their influence. In localities where they have members enough they are running the local Agricultural Societies—electing officers who will put a stop to horse-racing at Fairs. They have succeeded wherever they have tried, thus far, and the movement will probably be extended wherever Patrons of Husbandry are numerous enough to make it worth while. Horse-racing at Fairs has long been a severe injury to the best interests of farmers, and all friends of true Agricultural progress will rejoice at any means by which the evil may be abated.

Western N. Y. Ag. Society.—An annual meeting of this Society occurred last week, when the following officers were chosen:—President, Thos. Brown, Jr. Vice-Presidents, Jerome M. Keyes, Chas. F. Wadsworth, Walter Cole. Secretary, Chas. A. Pool. Treasurer, John W. Stebbins. Directors, Benj. Fellows, H. H. Hickox. Messrs. Heman Glass, D. D. S. Brown and Willard Hodges were chosen to represent the Society at the election of officers of the State Agricultural Society.

CENTENNIAL ITEMS.

Mr. A. T. Stewart will contribute largely to the Art Gallery.

"Shall the exhibition be open Sundays?" is now the question.

Ten thousand silk flags will decorate the Main Centennial Building.

"Bull Run" Russell will write up the opening ceremony for the London Times.

The Agricultural Building will have somewhat the appearance of an old English cathedral.

The display of fireworks on the night of May 10 will be the finest ever seen in this or any other country.

The London Graphic will send a corps of ten artists to take illustrations for that paper during the summer.

The several Centennial hotels are rapidly approaching completion, one (Trans-Continental) opening in April.

The Pavilion for the English Commissioners will be elegantly fitted up and will have sleeping rooms and a restaurant.

There will be an official daily newspaper published on the grounds, and a number of minor Centennial publications.

Goods to be exhibited are beginning to arrive by every steamer; but unpacking will not commence before March.

In the Art Gallery will be full-length portraits of all the Presidents of the United States, from Washington to Grant.

The site selected for the encampment of the West Point cadets is very beautiful. The encampment will last ten days.

RURAL BREVITIES.

Additions to Clubs are now in order, and it is not too late to start new ones.

Michigan owns a million acres of public land appropriated for school purposes, and yet unsold.

Back numbers of this volume (from Jan. 1,) can be supplied to all new subscribers, and will be sent unless otherwise ordered.

Franklin Co. Kansas, shipped 35,000 bushels of castor beans the last season, the receipts for the same amounting nearly to $100,000.

Queen Victoria sold last year $15,995 worth of fat cattle, sheep and hogs from the Show Farm, formerly owned by the Prince consort.

Some localities in New Jersey have to purchase potatoes this year, on account of ravages by the potato beetle. Never mind, potatoes are plenty.

A Clackamas Co. (Oregon) man is exhibiting a beet that weighs 18 pounds and measures 34 inches in circumference. He wants somebody to beat that.

W. B. Griggs of Sonoma, Cal., raised a hill of potatoes, five tubers of which weighed sixteen pounds. The remaining small potatoes weighed seventeen pounds.

Robert Douglas & Sons, of the Waukegan (Ill.) Nursery, send us their neat Wholesale Catalogue of Evergreen and Ornamental Tree Seedlings, &c., for the Spring of 1876.

There is a farm near Waterloo, Seneca County, on which is raised every year $600 worth of moss, which is used by the nursery men for packing trees. It is sold for $5 a load on the ground.

Recent warm weather has caused peach trees in Somerset, Ky., to blossom prematurely, and loss of the crop is expected to follow. Grasshoppers have also appeared, a bad indication for next summer.

D. M. Ferry & Co., Detroit, Mich., send us their Illustrated and Descriptive Catalogue of Garden, Flower and Agricultural Seeds. It comprises 252 pages, and is admirably arranged and beautifully illustrated.

A Tennessee farmer had his crops, stock, &c., damaged by the late floods to the extent of $2,606, but gained by the deposit of a rich sediment on 550 acres of land, which he valued at $5,500, or a clear gain over loss of $2,900.

Maine farmers do not grow oats enough for the State, though Maine is one of the best States in the Union for oats. We shall soon have New England farmers conceding that there is nothing they can profitably grow in competition with the West.

Messrs. Briggs & Bro. of Rochester, N. Y., and Chicago, Ill., send us the January No. of their Quarterly Floral Work for 1876. It contains a great amount of interesting information about flowers and vegetables and should be widely read by lovers of flowers and those interested in the vegetable garden.

Dexter's dam died at Montgomery, Orange Co., N. Y., last week of congestion of the lungs. She belonged to Mr. Jonathin Hawkins, who raised Dexter. She was 27 years old, and the dam of other fast trotters who have distinguished themselves on the turf. The mare was famous on the road years ago, and was noted for her endurance and speed.

BUSINESS NOTICES.

BRIDE & CO,
769 Broadway, N. Y., want agents for the best money-making article in the world. Send for particulars.

An Article of True Merit.—"Brown's Bronchial Troches" are the most popular article in this country or Europe for Throat Diseases and Coughs, and this popularity is based upon real merit.

I'VE BEEN THINKING.

I've been thinking, I've been thinking,
What a glorious world were this,
Did folks mind their business more,
And mind their neighbor's less,
For instance, you and I, my friend,
Are sadly prone to talk
Of matters that concern us not,
And others' follies mock.

I've been thinking if we begin
To mind our own affairs,
That possibly our neighbors might
Contrive to manage theirs.
We've faults enough at home to mend—
It may be so of others;
It would seem strange if it were not,
Since all mankind are brothers.

Oh! would that we had charity
For every man and woman;
Forgiveness is the mark of those
We know "to err is human;"
Then let us banish jealousy—
Let's lift our fallen brother;
And as we journey down life's road,
Do good to one another.

The Story-Teller.

"NOT A DROP MORE, DANIEL."

DANIEL AKIN had become a confirmed drunkard. So fully had he come under the dominion of the bottle, that he was perfectly miserable when he could not obtain the means of gratifying his thirst. He had neglected his family till his wife's father had taken her and the children to the paternal roof. He had spent all his substance in drink and was kept from the poor-house only by performing menial services for his food and by the kindness of Thomas Edgerton, a member of the Society of Friends, who had known him from his youth, and who had a strong hope that, in the course of time, he would see his folly and turn again into the right path.

Hoskins, the leading liquor seller of the place, had let him have drink so long as his money lasted but would trust him no longer. He was lounging about the saloon one bright moonlight evening, pleading with the keeper to trust him for a drink. His reply was sharp and unfeeling:

"Not a drop more, Daniel!"

He remained awhile longer and then left. As the cool air of the evening fell upon him he, all at once, gave utterance to his feelings in the following strain:

"'Not a drop more, Daniel.' Am I drunk or am I sober? I am sober. 'Not a drop more, Daniel.' Did Hoskins think a drop would hurt me? No; but my money was gone. He has got all; got everything I had—even the Bible my mother gave me. He has got the boots which my wife, with her own earnings, bought for Jennie. 'Not a drop more, Daniel.' Daniel, what say you to that? I say so, too. I once had good clothes, but now I have nothing but rags. 'Not a drop more, Daniel,' till I have clothes again as good as when Mary and I were married. I once had a good watch; but that, too, is gone! 'Not a drop more, Daniel,' till I have another horse and buggy as good as I once had. I once had cows that furnished my family with butter and cheese, but Hoskins has got them. 'Not a drop more, Daniel,' till those cows, or others as good, are mine again. I once had this wallet full of bills; but now not a cent have I got. 'Not a drop more, Daniel,' till this wallet is well filled again."

By this time he had reached the place where he formerly resided, and leaning up against the fence, he mused a long time in silence. He viewed the desolate place by the light of the moon, and his eyes ranged over the house and farm, once his own. He then said to himself:—"Once I owned this house and farm. Here I was born. Here my father and mother died. I was the pride of their hearts; but I brought down their gray hairs with sorrow to the grave! Here I began my married life, and all that heart could wish was mine. Here Mary and I took comfort together till Hoskins came and opened his rum-shop, and now he calls it his. In that south room my children were and there my Jennie died. O, how sorrowful she looked when she saw me take her boots and start for the store to pawn them for rum, while she lay sick upon the bed. And then, how she begged for me never to strike her mother again! I can see her now—her pale face, her wasted form; but she cannot come to me again. And O, my wife, how shamefully I abused her! It was not your Daniel that did it. No, it was Hoskin's accursed rum! No wonder you were taken from me by those who loved you and would not see you abused. They won't have me in the house; they won't let me live with you. 'Not a drop more, Daniel,' till this house is mine again. 'Not a drop more, Daniel,' till these broad acres are again in my possession and the wife and children that are living are in yonder rooms and we are a happy family once more. 'Not a drop more, Daniel.' Help me, my God, till all these things are accomplished! I thank you, Hoskins, for these words. I shall not forget them."

He had become so much occupied with his thoughts and spoken in a tone so loud, that he had not noticed the wagon which had reached the road, in which was seated the kind-hearted Quaker before mentioned. He stopped his horse and heard distinctly the language Daniel used. As he closed his soliloquy, he turned and saw Thomas Edgerton, who said:

"Daniel, does thee mean to keep thy vow?"

"Yes, friend Edgerton, I do."

"Thee has promised a great many times thee'd drink no more. What makes thee think thee will keep thy vow this time?"

"I know, friend Edgerton, I have often vowed I would drink no more. But now I feel different from what I have felt before; my heart is almost broken and I feel my weakness; and I believe God will help me this time."

"God grant that it may be so! Daniel, get in and take a seat. Thee must be hungry; go home with me."

On the way the Quaker drew out of him all that has been written, and he advised him to go to California. He told him to go to New York and work his way round the Cape. He decided to do so. The Quaker kindly promised to furnish him with suitable clothing.

"Thee would like to see thy wife and children before thee goes?"

"I should—but they have become so estranged from me; if I went, perhaps they would not believe me. I think it would be better they should not know where I am. I want to surprise them and hope to do so by coming back a sober man, and with money enough to make them comfortable. I prefer that you and your wife should be the only persons in the place who shall know where I am or what I am doing."

Thus, while riding toward the quiet farm-house of the Quaker, the whole thing was arranged. When they reached the farm the horse was put into the barn, and they entered the house. As they seated themselves before the fire, the Quaker said to his wife:

"Amy, thee can put on another plate. Daniel will stay with us a few days, and then he is going to California."

The good Quaker felt confident Daniel would keep his word this time. At the end of a few days everything was in readiness. The old horse was harnessed and, before daylight, Daniel Akin was on his way to the railway station. He had not been in the village since the night when the words, "Not a drop more, Daniel," were uttered. He was missed from his customary haunts; but it was supposed he had gone on a spree, and so nothing was thought of his absence. No inquiries were made, for all were glad that he was missing and cared not for his return.

He had been gone somewhat more than a year, when the Quaker was in the store of Hoskins and wished to hire a pasture for the coming season.

"I have one I will let you have free, if you will put up the fences on the place," said Hoskins.

"Where is it?" asked the Quaker.

"It's on the Akin's farm," was the reply.

"If thee will let it at that rate, thee must have let it get out of repair."

"It is, indeed. I cannot leave the store to look after it. The house is poor, and the family that lived in it last were too shiftless to buy wood, so they burnt up all the fences; in fact, I would rather sell it than rent it."

"What will thee take for it?" inquired the Quaker.

"It cost me $1,600."

"Yes; but thee paid in goods, and charged thine own price for them."

"To be sure I did. Akin could not get trusted anywhere else, and I felt that I was running a great risk in letting him have goods, so I charged accordingly; just as anybody else would have done under the circumstances."

"But thee has not told me what thee will take for the place. I will give thee $800 for it, if that is any object to thee."

Hoskins thought long enough over the matter to conclude that the interest of $800 was far better for him than a farm for the use of which he realized scarcely anything, and at last said, "You can have it."

"Very well, Hoskins; thee can make out the deeds to-morrow, and thee shall have thy money. By-the-by, does thee know what has become of Daniel Akin?"

"No; he has not been in the village for more than a year; at any rate, I have not seen him."

We may here tell the reader something that Hoskins did not know. The Quaker had that day received a letter from Daniel Akin, stating that he was at the mines hard at work and sticking to his motto, "Not a drop more, Daniel;" that he had laid up a few hundred dollars and desired him to inquire what the place he once owned could be bought for.

Mr. Edgerton had taken the method above mentioned to find out the views of Hoskins respecting the place; so confident was he that Daniel Akin would come home a sober man, with money in his pocket, that he had ventured to purchase the place, to keep for him till his return.

He wrote to Akin, informing him what he had done; and about three months after he received a letter from him stating that he had sent by express $500 in gold to a banker in New York, with orders to sell it and remit the proceeds to him, to go toward the money for the farm.

Gold at that time commanded a high premium, and the $500 became $800 before they reached the hands of friend Edgerton. Akin requested him to draw up a deed giving the whole property to his wife Mary, to have it duly recorded and left with the register of deeds.

In his letter he said:—"If, perchance, I should ever break my resolution, I shall have secured a home for my wife and children. I prefer, however, that they should not know anything of this for the present. If I live to come home, I will give Mary the deeds with my own hands; if not, you can do it. Now that the farm is bought, you had better stock it, for I still stick to my motto, 'Not a drop more, Daniel.'"

Another year passed away. By this time friend Edgerton had stocked the farm with young cattle and sheep, the fences were put in repair, and everything but the house wore a tidy appearance. Another remittance came, which paid for all the stock and left an overplus with which to repair the house. Carpenters were busy, and villagers who happened to pass that way found that extensive repairs were going on; still no one presumed to question the Quaker with respect to his plans. These repairs completed, furniture found its way into the house. A yoke of oxen were seen on the farm. The villagers were astonished to see the Quaker driving an elegant horse and riding in a new buggy. He received this short note one day:

"I have arrived all safe and sound. Please go and get Mary and the children."

Friend Edgerton rode over to the next town and called on Mary's father, and invited her and the children to go home with him and make a visit. The invitation was accepted and they returned with the Quaker to his house. On the afternoon of the next day, he said:

"Mary, I want to go to the railway station. Thee and the children can stay with Amy."

He went down to the station and fetched Daniel and left him at his own house, where he had previously conveyed some provisions, and where he was to pass the night. It was dark when friend Edgerton reached his home.

Next morning friend Edgerton said to Mary: "Mary, I suppose thee has heard I have bought thy old place? I have got it fitted up, and the children shall ride over after breakfast and see it. I think thee will like it."

They rode over, and Mary was surprised to see the changes which had taken place. They looked over the lower rooms first; and over the mantelpiece in the sitting-room was a frame, and under the glass, in large gold letters, were these words:

"NOT A DROP MORE, DANIEL!"

Mary, on reading these words, said, "O, friend Edgerton, if Daniel could have said these words and stuck to them, this beautiful place might have still been his."

"Then thee don't know where Daniel is?" asked the Quaker.

"No, I have not heard anything of him for more than three years."

"Thee would like to see him, would thee not?"

"O yes, indeed I should."

"Let us walk up stairs."

As they went up the front stairs Daniel slipped down the back ones and took his stand in the front room. When they returned, Mrs. Akin noticed a stalwart man standing in the room with his back to the door, and started back for an instant. The Quaker said:

"It is a friend, Mary."

Daniel turned around; but in the man with the heavy beard and mustache Mary did not recognize her husband. Daniel advanced to the step where Mary was standing and, in a voice tremulous with emotion, exclaimed:

"Don't you know me, Mary?"

We leave the reader to imagine what the meeting was. Friend Edgerton said he must go and see Amy and, addressing himself to Mary, said:

"Mary, this house and farm are thine. Daniel has got the papers and will give them to thee. Thee can stay as long as thee likes; thee will live happily once more, for that—pointing to the frame over the mantel-piece—'Not a drop more, Daniel,' is his motto now, and will be as long as he lives."

Daniel and his wife fell on their knees before the Lord. Their prayers were mingled with many tears; but in their future lives those prayers were found to be answered.

Several years have passed away since the above events occurred and Daniel Akin, now an earnest Christian man, still sticks to his motto, 'Not a drop more, Daniel!'"

MISS KITTIE'S KITTY.—[See page 63.]

DON'T struggle and kick, or I'll give you a pat;
I'm going to teach you—so try and spell CAT!

But, dear! what's the use? If you spelt all the day,
I could not make out the small mew that you say.

"TRAMP! TRAMP!! TRAMP!!!"

HE was travel-stained and weary, and his eyes had a far-off, wistful look, as though he knew that rest was not for him below, let his tired heart crave it never so much. And as he humbly asked the lady of the house for a morsel of food, his venerable appearance and evident want aroused all her womanly generosity, and she presently set the poor tramp down to the remains of the family dinner.

"Poor old man!" she murmured sympathetically, as she saw him lean back in his chair, leaving his food untouched on his plate, "he is too weary to eat"—and she asked him if he felt ill.

"Not exactly, mum," was the answer in a humble voice; "but mos' people cooks their roast beef till it's overdone, an' overdone beef don't gen'lly agree with me."

"Y' hav'nt got any Wooster sauce, have ye?" continued the mendicant; "I mos' gen'rally use it when beef an't cooked to suit me."

Unfortunately, the house of McCormick was out of "Wooster sauce;" but Mrs. McC. brought the mustard and a plate of nice pickles, observing, with the faintest trace of sarcasm in her tone, that if she'd known he was coming, she'd have looked out for something better.

"Oh, I ain't very pertick'ler, mum," said the old man, as he helped himself to another spoonful of gravy and a cucumber pickle, "on'y I jes' happen-'nd to mention it, 'cos where there ain't no pie nor nothin' sweet for desert, overdone roast beef's more like to disagree with me;" and the meekness in the vagrant's wrinkled face was touching in the extreme as he looked humbly around the table, as though his former glance might have overlooked the luxuries of which he spoke.

But Mrs. McC. was rather too far gone with speechless indignation to frame a suitable answer, and so the weary old man, with a mournful sigh, went on eating, and developed a most singular and wonderful appetite, which was gradually appeased as the 4-pound piece of beef was reduced to a mere shapeless fragment; and the last boiled potato had vanished from the dish.

"I hope you've made a dinner!" ejaculated Mrs. McC., in a fine irony.

"Well, yes'm; 'ive eat wuss wittals," said the old mendicant, with deep humility, as he pushed his chair back from the table and appeared to seek something on the floor.

"What is it you're a lookin' for?' demanded Mrs. McC., with a snap in her voice that reminded one of the slamming down of the lid of a chest.

"Nothin', mum; that is, nothing partick'ler. I didn't see no napkin, an' thought I might a' dropped it——"

But he never finished this speech, and five seconds later his white locks vanished through the doorway with amazing celerity; and an infuriated female with a mop followed so closely behind that he got fully a half mile from the house before pursuit ceased and he was able to light his cigar.—*Boston Commercial Bulletin.*

A BARMAID'S FORTUNE.

It is not often that a pretty barmaid falls into a fortune of £80,000, as a very pretty barmaid at the Harp, Jermyn St., London, has just now done; but then probably few pretty barmaids deserve such luck as well as this one did. Three years ago a very well-known man was Mr. Thomas Alexander Mitchell, member of Parliament for Bridgport and senior member of the firm of Mitchell & Co. of London and Riga. He had represented Bridgport for thirty years. His business was extremely profitable he had accumulated a fortune of about £250,000. He was, however, in the habit of drinking a great deal, and he liked best to do his drinking at the Harp, Jermyn St., where he was served by the pretty Miss Helen.

In 1872, to the surprise and amazement of all his acquaintances, he walked off with Miss Helen one morning and married her. She made him an excellent wife, and to a great extent cured him of his intemperate passion for drink. Last March, however, Mr. Mitchell was taken ill and died. A few days before his death he made a will by which he left £80,000 to his wife: gave legacies of £1,000 each to his old servants and acquaintances; provided an annuity of £100 a year for some old ladies, his cousins, and left another £80,000 in the firm of which he was the leading partner, on condition that it should remain for twenty-five years, and that then his wife should have one-half of it, while the other half should be retained by the firm.

The rest of his property—that is, about £75,000—he bequeathed to the Metropolitan Board of Works, leaving them to do what they liked with it. Mr. Mitchell's relations were greatly displeased when they learned of this will, and they resolved to dispute it. Their grounds of dispute were that the will was not properly executed, that it had been obtained by undue influence, and that the testator was not of sound mind when he made it. The case has just been tried in the Probate Division of the High Court, and the will has been sustained, it being shown that the pleas set up by the relations were wholly and absurdly false. So the pretty young widow gets her £80,000 down, and £40,000 more in expectancy, while the Board of Works comes in for its £75,000 or £80,000.

HOW A HUSBAND WAS WON.

There were eighteen or twenty of us, mostly girls, says a writer in the New Orleans Bulletin. The subject of the conversation was servants. "Ah, girls," said the matron, "you have very little idea of the trouble we have with our servants, particularly now-a-days, when money is scarce and you are not always ready to say, 'Here's your money—you must seek another place.'" This was said in a sad voice, but the good old dame brightened up when she added:—"It reminds me of times gone by, when money was plenty and provisions were cheap. I had a German cook, a fine, buxom young lass, florid as a summer-sunset and robust as an Amazon. It struck me one day that the sidewalk in front of the house needed scrubbing and, being short of help at the time, I ordered the cook to do the work. She refused peremptorily to comply, claiming that it was beneath her dignity. The kitchen, she said, was her place; and I replied by handing her her month's wages, remarking coolly that I could quickly find somebody that would. Sophie had soon changed her mind, and an hour afterwards the sidewalk was as clean as any neat housekeeper could wish. But that was not all. The next day I was told that I was wanted at the hall door by a hard-working neighbor, a shop-keeper and apparently well to do. In a few words my neighbor had explained, in broad Teutonic accents, that he had seen my servant the day before scrubbing the sidewalk, and he added, exultingly, 'She worked with such care and vigor that I resolved from that moment that she should become my wife.' In short, girls, in a few days we had a sensation wedding in the neighborhood, and I had lost one of the best servants in the world."

A STRANGE STORY.

A curious incident is reported in the American papers. About ten years ago a Jew, in straitened circumstances, left Transylvania for America, to improve his position in the New World. He left a wife and several children behind, and promised that as soon as it was within his means he would send them some money from America. There fortune smiled on him, and when he had amassed a sum of 60,000 florins he resolved to return home and surprise his family with his wealth. He started without apprising his family of his intended return, and on his way home he arrived at Hamburg, where he was seized with so dangerous an illness that he made a will, bequeathing all his property to his wife. He recovered, however, only to find that during his illness his money had been stolen from him by a man who nursed him. A few benevolent persons, sympathizing with his misfortunes, collected about 100 florins, wherewith the unfortunate Jew resolved to return to America in order to retrieve his fortunes. In the meantime the nurse had decamped with his booty to America where, shortly after his arrival, he died suddenly. The American authorities sent the coffin, with the 60,000 florins, to Transylvania and, as the will was also found in the coffin, the authorities at the same time acquainted the relatives with the will of the testator. After the usual period of mourning the wife contracted a second marriage. The first husband had, however, again saved a considerable sum of money, and eventually returned to his native country to find his wife married to another man. The event has caused a great sensation in the neighborhood, and it is stated that a conference of rabbis is about to be held to determine which of the two husbands the woman belongs to.—*Jewish World.*

The Literary World.

NEW PUBLICATIONS.

One Hundred Gems from the London Art Journal. Illustrations of the Best Works of Famous Painters. [Quarto.] Boston: Lee & Shepard — New York: Lee, Shepard & Dillingham.

Nothing more conclusively proves the progress of art, and the taste of our people for artistic productions, than the fact that there is a demand for such publications as the one above entitled. Though our Republic has only reached its Centennial year, its people have made wonderful progress and inaugurated many improvements in various branches of art—thus creating a taste for and consequent desire to possess choice illustrated works, engravings, paintings, statuary, and other articles of *virtu*. That the New successfully vies with the Old World in matters of art cannot yet be claimed, but that the former equals the latter in several important departments is undeniable. Those familiar with what has been and is being done in this country—especially in the way of engraving, lithographing and illustrative printing (both plain and in colors)—are aware that we are no longer necessitated to send abroad (to London, Paris, Berlin, &c.,) for choice artistic work. On the contrary, the tide is turning. But a few days ago a superior artistic printer in New York received an order from London for a large quantity of cards to be executed in colors and gold, without regard to price. And the beautiful work before us demonstrates that in the line of engraving and printing illustrations we are not a whit behind the most expert Europeans. It is indeed a magnificent work, each of its One Hundred Illustrations being so complete and delineative as to require no text description. It will prove a charming treasure to all who become its possessor, either as a gift or by purchase.

The Teacher's Hand-Book—For the Institute and the Class Room. By Wm. F. Phelps, M. A., Principal of the State Normal School, Winona, Minn. [16mo.—pp. 335.] New York: A. S. Barnes & Co.

The author of this work evidently thinks for himself and knows what he is about. In the outset he frankly remarks that it was no part of his aim to write merely that with which everybody would at once agree. "But free thought and free discussion are the soul of progress," he adds, and then continues:—"Differences of opinion are the life of discussion, out of whose crucible must finally issue the pure gold of truth, the only Philosopher's Stone worthy of human seeking. If, therefore, what is here written shall serve to excite discussion, awaken interest, and quicken zeal in the great work of elevating the teachers of our country to that commanding position which they should ever be worthy to occupy in the public regard, its leading purpose will have been fully realized." The work is worthy the careful perusal of every one engaged in advancing the cause of education, particularly in country schools, to the promotion of whose interests Mr. Phelps' contribution is especially dedicated. Referring, we presume, particularly to his own State, the author says:—"More than nineteen-twentieths of our children derive their sole educational advantages in the common schools, and these privileges, such as they may be, are limited principally to the school period below the age of ten or twelve years. This is especially true of our rural population, who compose the great mass of the people." And yet, how few people pay more attention to their district schools, teachers, and the education of their children, than they to their barns, stock, and hired men! Read this book, and "reform it altogether."

Songs of Three Centuries. Edited by John Greenleaf Whittier. [12mo.—pp. 352.] Boston: James R. Osgood & Company.—1876.

In this handsome volume—a large duodecimo, compactly printed in double columns—one of the greatest poets of the age has exhibited his rare taste, discrimination and judgment. In opening his Preface the editor modestly says:—"It would be doing injustice to the compiler of this volume to suppose that his work implied any lack of appreciation of the excellent anthologies already published in this country. Dana's 'Household Book of Poetry' is no misnomer; and the honored names of Bryant and Emerson are a sufficient guaranty for 'Parnassus' and the 'Library of Song.' With no thought of superseding or even of entering into competion with either of these large and valuable collections, it has been my design to gather up in a comparatively small volume, easily accessible to all classes of readers, the wisest thoughts, rarest fancies, and devoutest hymns of the metrical authors of the last three centuries." And we think the design has been most admirably fulfilled, for the work is replete with gems from the best authors—such as will be appreciated by all lovers of poesy. What renders the volume complete, adding greatly to its value, are the copious indexes given. In the beginning we have "Contents" and "List of Authors," and at the close "Index to First Lines," and "Index to Subjects"—so that the reader can readily refer to author, title or subject. In this respect the work is a model worthy of commendation to, and imitation by, careless book-makers.

A Farmer's Vacation. By Geo. E. Waring, Jr., of Ogden Farm. Reprinted (with Additions) from Scribner's Monthly. Illustrated. [8vo.—pp. 951.] Boston: James R. Osgood & Co.—1876.

The Preface to this volume is comprised in a single sentence, as modest as it is terse;—"The papers here collected are notes of a trip through some of the Netherland Provinces, parts of Normandy and Brittany, and the Channel Islands, made in August and September, 1873." The work is divided into Chapters severally entitled as follows:—Hollow Land, Droogmakerji (the Dutch for Drainage), Dutch Farming, the Bight of La Manche, Old Jersey, Guernsey, and Sark. Of course a practical, observing and educated man, like Mr. Waring—one who looks sharply into things and has the rare faculty of vividly describing what he sees—could not fail of making a most interesting and valuable work after a trip to the regions named; and such is the one we have just been examining and admiring. The information it contains relative to Dutch Farming and Drainage, Jersey Cattle, and on other practical subjects, renders the volume of special interest and value to our rural population. The numerous maps and other illustrations are invaluable in connection with the descriptive text. Withal the work is published in superb style—equal to the best Holiday gift books—and we reckon it a good sign that a practical, or at least a semi-practical, volume is ventured upon in garb so rich, even in these Centennial times.

LITERARY ITEMS.

Chas. G. Leland is to raise the wind by a volume on "Fans."

The centennary of Boccaccio has called out at least ten new publications on that writer in Italy.

Mr. Tennyson's works (next edition) are to be annotated with explanations of all the obscure passages.

A volume of "Miscellanies, Old and New," by the Rev. John Cotton Smith, D.D., is to be published soon.

Henry Holt & Co. have added "Pretty Miss Bellew," by Theodore Gift, to their popular "Leisure Hour" stories.

Mr. David A. Wells has written a little story which the Messrs. Harper will soon publish, with illustrations by Nast.

A "Comprehensive History of Methodism," by the Rev. Dr. James Porter, is announced by the Western Book Concern.

Carleton & Co. have brought out Mrs. Darrington Deslonde's novel, "The Miller of Silcott Mill," in a thick 12mo. volume.

Bishop Huntington has written another little Lenten book, "New Helps for a Holy Lent," which E. P. Dutton & Co. will publish.

Dodd & Mead have opened the Centennial year by issuing a new "Life of George Washington" by that indefatigable maker of books, J. S. C. Abbott.

Rev. E. P. Roe is at work upon a fifth novel, which will be a historical romance founded upon Revolutionary events on the west bank of the Hudson.

Rev. F. W. Farrar, author of the "Life of Christ," has written an introduction for a new edition of the "Imitation of Christ," which will be published by E. P. Dutton & Co.

Prof. Wm. Swinton has prepared a little "Bible Word-Book," in which he gives all the words in the Bible which are now modified or obsolete, with explanations. It will be issued by Harper & Bros.

The boys will have cause to be grateful to G. P. Putnam's Sons this spring for two promising books—the story which Bayard Taylor is writing for them, and another book by George Cary Eggleston, "Stories from Ancient, Medieval and Modern History."

Emerson's new essays are being anticipated with a lively pleasure in England. A Piccadilly publishing house is engaged in printing them. Emerson, Poe and old Noah Webster are now-a-days the most esteemed of American *litterateurs* in the United Kingdom.

Sabbath Reading.

THE CHRISTIAN'S HOPE.

BY A. M. MOSS.

O, weep not o'er the silent past,
O'er the days which have gone by;
Their sorrows, and their golden joys,
In the grave forever lie.

The hopes we fondly cherished then,
When in youth's merry prime,—
How sadly are they blasted now
By the ruthless hand of Time!

But we ne'er can cheer our weary way
By regrets and fruitless tears,
For they bring no solace to the heart
From the shades of former years.

'Tis true that many loved forms lie
In the dark and silent tomb,
But they've only passed to brighter land—
They'll in Heaven forever bloom.

'Tis only then that we can find
Surcease for our heavy sorrow;
But we'll reach its portals by-and-by
On Life's bright and glorious morrow.

"HE LEADETH ME."

BY MAY MAPLE.

"He leadeth me through green pastures, and beside the still waters."—Songs of David.

There are times when we get into the deep canons of life, and struggle and strive with mind, might and strength to climb up the perpendicular walls; and yet, at each succeeding effort, find it utterly impossible to gain a foothold among those adamantine rocks, or to reach a single twig around which to clasp our fingers—only seeing a narrow patch of blue sky above wherewith to comfort our eyes. As far as our vision can stretch, the way seems narrower and darker. If we could *then* remember that "He leadeth us"—that His guiding hand beckons us onward—how quickly would we cease struggling. Just as a tired child calmly rests in a fond mother's arms, would we trustfully lean upon Him, and watch for some opening that would let us pass out to the broad lands where the sun did not cease to shine—feeling sure that there was no path so dark that he could not find a way to a fairer clime. Or, had we faith in our Leader, we might still continue our efforts, but with a spirit that would give us the needed patience to overcome obstacles—the foresight that would make molehills of what would otherwise seem like mountain barriers.

Yes, "He leadeth us." We cannot always see the radiance that surrounds Him, white as the light, for our passions are allowed to cover our spiritual vision like a veil. And in our anxiety to make more rapid strides in the works we have planned to accomplish, we let go His hand and forget to follow in His footprints. Sometimes, to show us how powerless we are, He hides away from us for a season. But even then He sends messengers to us, all along the way, if we will accept their humble services.

Sometimes the sweet voice of a child lisps forth the message that He has sent. Again the aged sire or experienced matron leaves at the door a telegram. His mark is upon it: we feel that, though invisible, He is leading us with a strong, helpful hand. Blessed thought!—for the way is often through dense forests and tangled morasses, Will-o-the-wisps flash along the pathway, dazzling our eyes with their unsteady but brilliant torch-light. But He leadeth us, and we go on through valleys and over mighty mountains, till we reach the delectable hights, where we will behold the glory of that Elder Brother who cared for us while we were within the mazes of the wilderness.

SANDS OF GOLD.

Look above you, and in the overarching firmament read the truth of an all-pervading Providence. Yon sky is God's outstretched hand, and the glittering stars are the jewels of the fingers of the Almighty. Do you not see that His hand closes round you on all sides, and that you cannot go where universal love shines not?—*Gill.*

It is unsafe to base a prophecy upon the details of a creed, for if the men who meet in its name happen to have Christ in the heart, He will break out of the soul like perfume escaping from the flower; and behold! the man whose tenets we despise will stand nearer at last than we to the great white throne.—*David Swing.*

The friend who shows me the mirror of myself, who conceals no defects, gives me friendly warning, and heartily scolds when I have not fulfilled my duty—he is my friend, however little he may appear so.

O thou God's mariner, heart of mine,
Spread canvas to the airs divine!
Spread sail and let thy fortune be
Forgotten in thy destiny! [*D. A. Wasson.*

What a compliment to the religious education of Scotland is this, which some one says is the true test of a Scotchman:—"Ask him to repeat the twenty-third Psalm; if he cannot do it, be sure he is no Scotchman."

After the flight, the downy nest;
Over the shadowy river—rest.

They who are most weary of life, and yet are most unwilling to die, are such who have lived to no purpose—who have rather breathed to no purpose.

Nothing is rarer than a solitary lie; for lies breed like Surinam toads; you cannot kill one but out it comes with a hundred young ones on its back.

Ladies' Portfolio.

GIVE.

BY ROSE GERANIUM.

O, LIFE's pitiful pangs and its woe,
With no one to sooth or allay them!
O, the hearts that beat faintly and low
For kind greetings—and no one to say them!

Does a singing bird flit thro' your soul,
And its rich throat set music a-flowing?
Do soft heavens their sunshine unroll,
And spring blossoms bud and be growing?

O, open the windows of life
To the famished, who struggle and perish!
O, beckon them in from the strife,
To walk in the gardens ye cherish!

We none of us hold the estate
Of a blessing that bars out our neighbor;
We must gather and give, soon and late,—
We must compass the poor with our labor.

O, life's pitiful pangs and its woe,
With no one to sooth or allay them!
O, the hearts that beat faintly and low
For kind greetings—and no one to say them!

A HOME OF BEAUTY.

PERHAPS many of the readers of the RURAL NEW-YORKER—those young or even more advanced in years—are thinking that as time has gone in the snug little comfortable homes, that were in the beginning their pride and joy, have grown old-fashioned—that they do not compare with the larger and more elegant houses around them, and that they are not keeping up with the times. To such I would say, do not attempt to keep up with the times. Do not bring the struggle of fashion, pride and envy into that most sacred of all places—home. I will tell of a little house at which I have the pleasure of visiting for a few days. It is to me beautiful beyond description, for there are found not only the beauties which please the eye but which touch the heart. Each member of the family, from mistress and friend, to man and maid servant, are CHRIST'S humble followers, realizing their responsibility. Life with them is not a play day, but full of earnest plans and work, and far too short to spend any of the moments in idleness; so it is a busy household.

Five miles out from a city the young husband and wife went some fifteen years ago, and there took a Gothic cottage, exceedingly small, in the beginning, with but six rooms, I think—parlor, dining-room, kitchen and three bed-rooms. Thus the little nest remained for some time, but was finally enlarged, little by little as was necessary, all the time preserving the Gothic style, and with no want of harmony in the additions.

The exterior of the house is almost entirely embowered with woodbine and the green foliage of summer, and the later rich, warm autumnal hills, add a great charm to the place.

The library being the living room is easy and inviting with its open fire, easy chairs and bright cheer. The very atmosphere of some libraries is conducive to sleep, and unfits one for reading, but this, with its several windows, has not that fault. Instead of large, expensive book cases, these are simple oak casings, from ceiling to floor, all around the room, with the exception of spaces for windows and doors. The books are friends, each having their familiar places. Much of the ornamentation of this room, and the parlor as well, is what even the poorest may have with a little trouble—ferns, grasses, bitter sweet, autumn leaves, etc.—arranged in baskets and vases. The simple Nottingham lace curtains, with their decorations of the leaves and ferns, are to one far more beautiful than the most elaborate wrought curtains ornamented by heavy cornices. Let me tell you the manner of doing this: Pin into a long strip of white muslin, about two inches wide, your pressed ferns and leaves, either alternately or in groups as you like. The more delicate ferns and brighter leaves are best for this purpose, as the strong light which falls upon them from the window throws out well the colors. From the center at the top of the curtain suspend the strip, and so arch it over the curtain, pinning or fastening as closely as is necessary, until the ends reach the floor, one either side. Then cut in muslin a design for a small lambrequin to fit the windows, and on this place the ferns and leaves also. The effect of a window decorated in this style is very lovely.

The matting on the floors, which in summer are so cool and comfortable, has now been covered with bright mats and rugs, giving the room something of an Oriental appearance. The large, easy, old-fashioned chairs are made more attractive by long strips of cretowne the width of the chair, wadded, and tied with bright worsteds. These are laid over the top and reach down over the seat. Also a sofa has been made, which is entirely of home manufacture. The body of it is a box, some 75 x 25 inches, and 16 inches high. Then a cushion, to fit over the whole top, is filled with hair, and springs placed in it. This is fastened down, and over it a smooth covering of rep is placed. Around the three sides at the top a puff of rep some eight inches wide comes, and below that a wide woolen furniture fringe, reaching to the floor, finishes it off very neatly. Then make three cushions which, when placed on the sofa upright against the wall, will be same width as sofa. These are covered with gray rep, and finished with narrow puffings. By making the effort you can add quite an elegant piece of furniture to your parlor, and at less than half the expense which the same piece would cost if bought.

The bedrooms are pretty and simple, having neat muslin hanging curtains, and dressing cases or toilet stands of muslin over a color. These rooms are filled with choice pictures—and to all I would say, do not spend your money for common pictures, cheap paintings, chromos and the like. Wait, and adding a little more to the sum, buy a copy (an engraving is always desirable) of some fine original painting, piece of statuary, or some choice works—something which is not a mere passing fancy, but has a deeper signification. Such a collection, gradually brought together, will be a great source of gratification to not only yourself but your friends, and will be, as well, a means of education. Lord BACON says, "Houses are made to live in, not to look at," and so live in them—have your home a part of yourself, and with some individuality—there bring out all that is in your power of the beautiful and good, and with the higher education and cultivation, the stronger love for Nature and all GOD'S wonderful works, the better can you do this.

In the care of your houses do not neglect your grounds, for if you do there will be an incompleteness about all. You may not be able to do much to them, but with a little thought and taste, and not necessarily a large expenditure, they can be greatly beautified. Do not attempt a uniformity with other gardens and grounds around you, but if you have any natural advantages in the way of trees, rocks, little brooks, etc., as far as is possible with convenience and health, leave them and you will have a much more picturesque spot. In the grounds of the home that I have written of, the same mind that has planned the interior has also exhibited taste there. Flowers in little beds adorn the lawns, and vines grow around as they will. There are rustic chairs, and settees, baskets, stumps, etc., that, too, are original and of home manufacture. If, with the description of this dear little home, any of the RURAL readers have gleaned new ideas of living in and making more attractive their own homes, I shall be satisfied that this is not written without good result.

Nov. 10th, 1875. S. P. H.

MY LOVE FOR THE RURAL—ITS GROWTH.

MY father has been a constant RURAL subscriber over twenty years. The first number he received contained—if I remember rightly—a picture of a mammoth pumpkin; against it, just reaching to the top, stood a ladder, which a man (looking very small indeed) was apparently about to ascend in order to view the surrounding country. At that time I was such a small girl that the pictures only interested me, and I really thought that the wonderful man who made the paper raised pumpkins as large as that picture represented. After a few years the poetry, stories and puzzles were my delight.

When I commenced learning to bake I was perfectly happy when I had mother's consent—as I often did—to use RURAL recipes. Although a farmer's daughter, I confess that I paid but little attention to the agricultural and dairy departments until I became a farmer's wife. For two years sickness has terribly afflicted a dear friend, and my health has been very poor—consequently the hygienic information is eagerly sought for and read.

We have a little five-year-old boy who loves to look at the pictures now, and always wants mamma to read to him about them, and the stories for children. This I gladly do—hoping that the dear RURAL will flourish many years, and that he may live to love it and all things good and pure. Now I read almost every department with pleasure, and I believe profit. If we fail to get a number by Saturday night—which we sometimes do, as we live quite a distance from the post-office—I feel as if a meeting with an old and dear friend had been postponed, for the RURAL is such to me.

From a Cousin who is not very young.

Wayne Co., N. Y. C. W. V. S.

FEMALE SOCIETY.

ALL men who avoid female society (says Thackeray) have dull perceptions, and are stupid, and have gross tastes, and revolt against what is pure. Your club swaggerers, who are sucking the butts of billiard cues all night, call female society insipid. Poetry is uninspiring to a yokel; beauty has no charms for a blind man; music does not please a poor beast, who does not know one tune from another; but, as a true epicure is hardly ever tired of water, sauce, and brown bread and butter, I can sit for a whole night talking to a well regulated kindly woman about her daughter Fanny or her boy Frank, and liking the evening's entertainment. One of the greatest benefits a man can derive from woman's society is that he is bound to be respectful to her. The habit is of great good to your morals, men, depend upon it. Our education makes us the most eminently selfish men in the world, and the greatest benefit that can come to a man from a woman's society is that he has to think of somebody to whom he is bound to be constantly attentive and respectful.

DON'T BORROW TROUBLE.

WINTER is here. The leaves have fallen from the trees and have turned to dust and mire; the sweet smells have gone out of the woods and given place to decay and death. But do not accept Jeremiah as your prophet or receive his Lamentations as the gospel of the day. The world is not on the wing beyond our clasp. Humanity, government, arts, faith, devotion are not fading out, nor turning to destruction and empty silence. The coming "winter of discontent" holds in its hand the brightest buds of radiant promise. Even in the feeble flush and flicker of dying nature there is a prophecy of distant beauties and of the time when the singing of the birds will come. The days to be will be broader and brighter than those which have passed. The future into which we are drifting is not one of desolation. "Let not your hearts be troubled."

Reading for the Young.

MISS KITTY'S KITTY.

[SEE ILLUSTRATION ON PAGE 61.]

I HAVE heard Pa read of a learned pig,
And of dogs that could pick out their letters,
So, Kitty, come here, you're as clever as they,
And can learn as well as your betters!

Don't struggle and kick, or I'll give you a pat,
I am going to teach you—so try and spell "CAT!"
But, dear! what's the use? If you spelt all the day,
I could not make out one small mew that you say.

Books are for this Kitty, and mice are for that;
I can't catch your mice, and you can't spell my "Cat?"
We each of us have our own lessons, 'tis plain;
Run, Pussy, I'll not try to teach you again.

LETTERS FROM BOYS AND GIRLS.

From a Southern New York Girl.

DEAR COUSINS:—Who knows where our Cousin JOHNNIE is? I have looked for a letter from her for a long time, but have failed to see one. Has she forsaken us? I hope not, I am sure. I would advise Cousin FRANK B. W. to be careful or he may be sent West to keep YOUNG BECH and the rest of the boys company. I agree with "School Girl" in regard to the boys following the fashions. They think it very bad taste for the girls to part their hair on the side, but they must remember that they took the girls' style of wearing their hair, and we didn't want to be like them: so *some* (I will not say all of the girls, for I am an exception to the rule) took to parting their hair on the side. I think each had better keep their own fashion; it would look more sensible. I think I speak the sentiments of most of my Cousins. I do wish Mr. Editor would please put his photograph in the RURAL for Christmas. I am sure we would appreciate it. Will my Cousins please sign their names to their letters? WEBSTER S. had better give us his model for making a calico dress, for perhaps some of the rest of us can afford one as well as GRACIE S. Wishing you all a Merry Christmas and a Happy New Year, I remain, your Cousin—ADELE WOOD, *Elmira, N. Y.*

From a Missouri Boy-Agent.

DEAR RURAL:—Your "Inducements to Agents" have persuaded me to act as an agent for your paper. I am going to get up a club, and will take a printing press for a premium. I am thirteen years of age. I have never written to the RURAL before, so I will write a few lines for the Boys' and Girls' Column. I am going to school. I will tell my studies:—Goodrich's U. S. History, Grammar, Philosophy, Algebra, Dictionary, &c., &c. I like all my studies very well, especially Algebra and Philosophy. I live in the country about three miles from any village. Get your Geography and look six miles east of Atchison, Kas., and you will know where I live. This is a very pretty country. Will Cousins excuse my very short letter? Send the "Press" by express when I send you the club. —EDWIN ELLIOTT, *Rushville, Mo.*

From an Illinois Girl.

MR. EDITOR:—We have been taking your paper for a long time, and I must say this is my first attempt to write a letter to be placed in the Young Folks' Column. I live in the city of Rockford, and also attend school there. It has been very pleasant until now. It is very cold; the thermometer has stood six deg. below zero. We had one or two days of good sleighing, but there is no snow to be seen now. Almost every night there are parties, and we enjoy ourselves ever so much. I have been reading some of WEBSTER SMITH'S letters, and from them I cannot say I admire him, if he *is* light complexioned and considers himself good looking. However, if he keeps his shirt fronts respectable very long, he does better than my brother. As WEBSTER requested GRACIE S. and others to answer his last letter, I am one of "the others," and trusting that GRACIE S. has her dress made, or will profit by the advice of WEBSTER S., I will close, hoping some time to become a Cousin. —HATTIE J.

From a Massachusetts Boy.

DEAR EDITOR:—This is my first letter for your paper. Perhaps I should not have written at all had it not been for the little mercy shown the female sex by Y. B. and others. What if the girls do talk about dresses?—what do you talk about? Is it not mustaches and cigars or some other worthless thing? I do not think it is because the girls have long tongues they talk so much. I think it is because their tongues are hung in the middle and run at both ends. They have a peculiar gift, given them by nature for talking. We should not correct them, for we have peculiar gifts also. Y. B. has made a great mistake by getting on the wrong side of the girls, and may mourn for it before he makes amends. I wonder if he is sick. I have not heard much from him lately; perhaps he is scared out. I advise all boys whose heads are level not to get on the wrong side of the girls.—A. R. MACOMBER, *Swansea, Mass.*

From a City Girl in the Country.

DEAR RURAL:—I have read many letters in your valuable paper, and thought I would try and write one. My home is in the city, but every summer finds me with my Grandpa in the country, where I am at present. We have taken your paper for a number of years, and I do not know how we could do without it. I have but one pet, that is a cat, and a very cunning one too. I have no brothers or sisters, as some of my RURAL cousins have, but I enjoy myself just as well without them. I think YOUNG TOM is quite sarcastic in his remarks about the fairer sex; but it does not worry me in the least, for no real gentleman would be guilty of such impoliteness. I will close for this time, but if I see this in print I will try again.—SUNSHINE, *Cowsackie, N. Y.*

From an Ohio Girl.

MR. EDITOR:—I have been reading some of the letters from the boys and girls in the RURAL. I think they ought to be thankful for the space you give them in your excellent paper. Our folks take eight papers, but we like the Youth's Companion and the RURAL the best. My Pa is a farmer, but he teaches school winters. I have two sisters, both younger than myself. Their names are CORA and LILLIE. We all go to school this winter to Pa, who is teaching his eighteenth term, twelve of which he has taught in our district. He has forty-five scholars. We live near a lovely pond surrounded by beautiful scenery. Perhaps if this is published I will write again.—IDA HAYMAKER, *Earlville, Portage Co., Ohio.*

From a Pennsylvania Girl.

MR. EDITOR:—Mama has been reading to me letters in the RURAL from the boys and girls. I never wrote a letter, so mama said if it was printed in the RURAL I could always have my first letter to keep. I go to school when I am well. I fell from the school steps and broke my leg, so I have to lay in bed and write this. I will be so glad when I can walk again. My papa is dead, but I have a mama and little brother and sister. My sister's name is ALMA, and she is two years old. Tell HARRIET N. W. I think ALMA is the dearest little sister and has the nicest name I know of.—MARY H., *Meadville, Pa.*

From a New Jersey Girl.

DEAR EDITOR:—I have taken quite a fancy to the RURAL, and thinking that you would like to have another contributor to the pages of your excellent paper, I thought I would write an essay and send to you, and if it pleased you to publish it in your paper and to count me as one of your contributors, I should like it very much. It is my first attempt at writing for a paper or anything else. I have done my best to make it good enough to put in a paper, and I will do the best I can at writing stories and short pieces if you will allow me to do so.—S. A. H., *Hopatcong, Morris Co., N. J.*

From a Central New York Boy.

DEAR EDITOR:—I would like to be accepted as one of your Cousins. I live on a farm. We keep ten cows. I have made out Cross-word Enigma No. 1. The answer is Guadalquiver. [Correct.] If this finds a place in the RURAL I will try again. —WILLIAM KING, *Chenango Forks, N. Y.*

The Puzzler.

ILLUSTRATED REBUS.—No. 3.

☞ Answer in two weeks. L. G.

DOUBLE ACROSTIC.—No. 1.

1. A FRUIT. 2. A measure. 3. To unfasten. 4. To look obliquely. 5. A boy's name. 6. Tenuous. 7. Any authorative prohibition. 8. A little elf. 9. Dress, tackle. 10. A town of France. 11. A farming implement. 12. A brook. 13. An image. 14. An Australian animal. 15. To furnish for support. My initials and finals give respectively the name of a poem and its author. X. Q. Z. H.

☞ Answer in two weeks.

CROSS-WORD ENIGMA.—No. 3.

My first is in limb but not in tree,
My second is in him but not in he;
My third is in hoe but not in spade,
My fourth is in knocked but not in laid.
My whole is an animal much feared in Asia and Africa. ALEX. BROWN, JR.

☞ Answer in two weeks.

DECAPITATION.—No. 1.

My whole is a kind of grass. Behead me and I am an admirer. Behead me again and I am across. From my whole take my second letter and I am a lid. From my whole take my last letter and I am a kind of spice. From my whole take my first and last letter and I am affection.

☞ Answer in two weeks. C. S.

DIAMOND PUZZLE.—No. 2.

1. A CONSONANT. 2. An Asiatic animal. 3. A sort of gum. 4. Parents. 5. A city of Tennessee. 6. Cooked on a gridiron. 7. A large pill. 8. A man of the Bible. 9. A vowel. Centrals form a city of Tennessee.

☞ Answer in two weeks. LITTLE ONE.

PUZZLER ANSWERS.—Jan. 8.

ILLUSTRATED REBUS No. 2.—Seek for honor not of men.

CROSS-WORD ENIGMA No. 2.—Josh Billings.

BIBLICAL DOUBLE ACROSTIC No. 1.—Initials, Dorcas; finals, Samuel.

PUBLISHER'S SPECIAL NOTICES.

The Rural is a very good present to send to a friend and it pleasantly reminds the recipient of the donor fifty-two times a year—this year fifth-three times. Any *subscriber* can send it to a relative or friend, as a present, at our lowest club rate—only $2.15, including postage.

Holiday Presents will be plenty this year among our Agent-Friends and others who form clubs for RURAL. Our list comprises many articles appropriate for presents. Induce a few of your friends to take the RURAL, and thus secure a Premium.

Officers of Agricultural Societies and Clubs, Granges, &c., can, if they will, materially aid in augmenting the circulation of the RURAL. Scores of such are already forming clubs; how many others will kindly do likewise?

Renew early if you would secure the uninterrupted continuance of the RURAL to your address; and pray don't forget to ask friends to join you in sending for the Fifty-three Numbers which we shall publish during 1876.

Back Numbers of this Year (from Jan. 1) can be furnished to all new subscribers, but we shall not send them hereafter unless specially requested. Those who desire can begin with any number, however.

The Best Paper, and the Best Premiums to Agents, is our motto. We ignore Chromos and all other cheap colored pictures, preferring to put our money *in the paper*, and in Premiums to Agents.

Select Your Premiums.—All persons entitled to Premiums will please designate what they prefer and notify us how and where to forward—whether by Freight or Express—if articles are not mailable.

Act as Agent!—Reader, if there is no agent for the RURAL in your locality please become one by forming a club. *It will pay.*

At Our Risk.—You can remit by Draft, P. O. Money Order or Registered Letter *at our risk.*

News of the Week.

MORE STEAMERS FOR EUROPE.

It is said that some New York capitalists propose to ask Congress for an appropriation to establish another American line of steamers to Europe. The appropriation is expected in form of a subsidy for mail carrying; but it is hardly probable that it will be granted. There is no good reason why mails for Europe should not be open to competition the same as through the different parts of our country. Going to Congress for appropriations is demoralizing business for all parties. Besides, it is not a good time to build new ocean steamers. Immigration has largely decreased, and last year fewer Americans went abroad than in several years past. Some of the companies having lines of vessels, hauled off a number on account of lack of business. The number of cabin passengers averaged 3,000 per company, and steerage 8,000, both showing a large decrease. Next season will probably be still worse for ocean steamers, as thousands of patriotic Americans who usually go abroad will remain to attend the Centennial Exhibition and spend their money at home.

HOME NEWS PARAGRAPHS.

The members of the boat clubs on the Harlem River talk of sending a picked crew to represent them at the opening of the Centennial Exhibition.

There are now 6,804 public carts in New York City engaged in draying and similar work. There has been an increase of public carts in the last 15 years of 1,077.

Gen. James Packard, ex-Representative in Congress from Indiana, has been appointed an internal revenue agent.

Congressman Morrison is said to be a favorite candidate for the Democratic nomination for Governor of Illinois.

Dennis Regan, Barney Rourke and Timothy Hayes, aged from 10 to 13 years, were drowned in Lowell, the wind carrying the sled on which they were riding into the swift water.

A large right whale and her calf were seen on one morning last week off Southampton, L. I. Four boats were launched, and after an exciting chase the cow whale was killed. The boats then started for the calf. The whale will make about forty barrels of oil.

Mr. Daniel Smith, a Westchester County farmer, started for White Plains on Wednesday week with a load of hay, and as he was driving down a steep hill the load swayed from side to side, and the shelving on which the hay was loaded struck on the hind wheel. The tire of the wheel struck sparks from an iron fender under the shelving. The hay was set on fire and the load was half destroyed before Mr. Smith discovered the fire, and his hair was burned before he could get to the ground. The horses tails were burned off before the hay was pitched off to save the wagon.

Mrs. Dr. Horr is a Vice-President of the Androscoggin County, Me., Medical Society.

The remains of the late Commodore Stephen Decatur arrived from Boston, Jan. 13, and were interred in the family vault in Greenwood Cemetery.

Mr. H. S. Thompson, a broker of 28 Broadway, died while riding home in a cab on the evening of the 13th inst.

A violent gale occurred in the Western Mediterranean, Jan. 13, and swept the Algerian coast with great fury. The damage to property is estimated at $100,000.

A wooden donkey, the head and tail of which are moved by pulling a rope in the store, at the same time ringing a bell, serves as a sign in Beekman st., N. Y. City.

During the last half of 1875 forty-four persons died in Philadelphia who had reached the age of ninety years and upward, fifteen being males and twenty-nine females. The oldest person was a man, who died at the age of 103.

In the breach of promise suit, Fannie E. Decker against John B. Elston of Unionville, N. Y., tried at Judge Dykman's First Circuit Court, at Goshen, N. Y., the jury gave a verdict for $5,000.

The Rev. Alphonse Dupont, formerly a Roman Catholic priest, has taken orders at Syracuse in the Episcopal Church.

Conscience money to the amount of $730, from Clinton, Iowa, was received at the Treasury Department Jan. 13, the sender being a Captain in an Iowa regiment during the war; $240.50 in gold, conscience money for the Government on the goods imported at New York, and appraised in error, was also received.

The President of the Catholic Association of Great Britain, the Duke of Norfolk, calls for subscriptions to aid the persecuted German priests, and heads the paper with $5,000.

Summary of the business transacted from Jan. 1 to Dec. 31, 1875, in the Carriers' Department of the N. Y. Post-office:—Number of stations, 12; street letter-boxes, 973; letter carriers, 429; letters and postal cards delivered by carriers, 63,164,776; newspapers delivered, 7,891,571; letters and postal cards collected, 62,057,757; newspapers collected, 15,175,661; postal cards, letters and papers deposited in stations, 82,423,123; letters registered at stations, 56,398; amount received for 44,728 of money orders issued at stations, $846,817.28; amount paid on 48,005 money orders at stations, $863,295.18.

Mr. Meagher, the present owner, has offered to the Centennial Commissioners a portion of the gallows on which the thirty-eight Sioux Indians were executed in Mankato in 1862.

Walter Folger, at the age of ninety, climbs into the tower of the town clock at Nantucket with apparent ease and regulates the machinery as perfectly as in his younger days.

The Senate Committee on Military Affairs had a meeting Jan. 13, at which Senator Logan presided for the first time this session. His health is improving slowly. The Committee agreed to report favorably on a number of Executive nominations, including that of Major Robert MacFeely to be Commissary-General of Subsistence.

A delegation of the Society of Friends appeared before the Senate Committee on Indian Affairs to urge the retention of Barclay White as Superintendent of Indian Affairs for the Northern Superintendency, headquarters at Omaha.

Henry H. Smith, a journalist, formerly of Michigan, and a prominent Liberal Republican, has been appointed Printing Clerk in the House of Representatives, the first recognition of the Liberal Republican element in the House.

Atlanta, Ga., affords an example worthy of imitation to other cities, both North and South. During the past year the city debt has been reduced over $50,000, and all bills paid upon presentation. It is impossible to increase the floating debt, as the charter makes the city fathers personally liable for any balance against the city on expense account at the end of the year.

It is asserted that Prof. David Swing has been offered the editorship of the Independent, and that he expressed his preference for his new church.

By order of the British Admiralty hereafter Roman Catholic priests will be permitted to go on board the training ships at Portsmouth, Plymouth and Falmouth.

The Industrial School for Girls in Hallowell, Me., is filled to its utmost capacity, and has already proved the most successful reformatory institution in the State.

Barney McQuade of Cumberland, Md., convicted of attempting to defraud the Government by forging county and pension claims, has been sentenced to six years imprisonment and to pay a fine of $1,000.

Dr. O. F. Cobb, a West Troy physician, was sent to the Penitentiary for six months and fined $50 for indecently disposing of the remains of two dead infants.

In the United States Circuit Court, Boston, Jan. 12, John W. Pierce, Jr., formerly cashier of the Merchants' National Bank of Lowell, was placed on trial on a charge of embezzling $150,000 belonging to the bank.

Charity Hayward of San Francisco has sued her husband, Alvinza, for divorce, alleging desertion for the past fifteen months. They have been married thirty years and have one child, a daughter, aged 15. The estate is worth $10,000,000.

Mr. Andrew J. Houston, a descendant of the famous Sam Houston of Texas, protests against the erection of a monument to his ancestor by means of a lottery scheme, as has been proposed.

Jefferson Davis has just lost a suit for $70,000 in a court at Vicksburg, Miss. The ex-President put in a claim for that amount against his brother's estate, but the court decided against him.

Mrs. Emily Tubman of Frankfort, Ky., has presented the Christian or cosmopolite congregation at Augusta, Ga., with a completely furnished church and parsonage, which she had erected at a cost of $101,850.

President Gilman has arranged for the erection of temporary buildings, and expects to open the Johns Hopkins University at Baltimore on the 6th of October. No permanent buildings can be erected till interest on the building fund has accumulated.

The Executive Committee of the Taxpayers' Union of Milwaukee favor a consolidation of city and county governments.

One hundred and thirty-four criminals, of whom seventeen were murderers, were pardoned out of the Illinois Penitentiary last year.

The Massachusetts Prohibitionists have got a bill into the Massachusetts House for the enforcement of the act passed last year concerning the sale of intoxicating liquors.

Over 365 tons of coal and 1,000 bread tickets have been given out by the Overseers of the Poor of Newark, N. J., since Jan. 1.

Newburyport is to have a Centennial leap-year party—a ride on sledges; supper—baked clams, baked beans and Indian bread, by the light of tallow candles.

It is said that the center of the population of this city is nearly at Fourth avenue and Fourteenth street.

There are now 1,388 express wagons in this city. There has been an increase in the last fifteen years of 796.

Snowfalls under a cloudless sky are common in Virginia City, puzzling strangers. The snow is blown from Mount Davidson, which is close by the town, and is whirled through the streets by the wind.

President Seelye has made a public statement of the financial condition of the new female college at Northampton, Mass. The trustees have thus far made the income derived from the $387,468 gift of Miss Sophie Smith and the $25,000 contributed by Northampton cover the buildings and current expenses, so that the original total of $412,468 remains substantially intact; and they now estimate their productive funds and real estate at $525,000.

During 1875 the number of vessels totally lost, hailing from San Francisco or sailing from that port was forty-two, viz: Three steamers, fourteen ships, ten barks, three brigs, eleven schooners and one sloop, besides one United States steamer. The number of lives lost with them amounted to nearly 300.

A recent visitor to the Dismal Swamp describes it, in Forest and Stream, as having lost none of the characteristics which gave it its name. Bears are not so plenty there as when the region was rarely penetrated by man, yet they still afford sport for hunters. Lake Drummond, once believed by the ignorant to be bottomless, is really not in any place more than fifteen feet deep. Its water, impregnated with the juices of juniper and gum leaves, is of the color of wine, and is drunk as a remedy by consumptives.

Chas. K. Landis is now being tried in Bridgeton, N. J., for the murder of Uri Carruth, whom he shot on March 19, 1875, at Vineland, N. J., and who died a few weeks ago.

F. C. Pierce of Grafton, Mass., is collecting materials for a history of the Pierce family. The original Pierce was John Perse, who came over in 1630. His descendants are variously called Pierce, Pearce, Perse and Pearse. Ten thousand names have been collected, and all the Pierces are expected to respond.

FOREIGN NOTES.

Sir Daniel Gooch, manager of the Great Western Railway, hopes to be able to run trains at the rate of seventy miles an hour soon.

It is expected that the revenue of France this year will exceed £100,000,000 sterling, and be nearly £4,000,000 in excess of the estimates.

A scientific college, built at a cost of $500,000, with an endowment of $150,000, has been given to the city of Birmingham, England, by Sir Josiah Mason. These represent some of the profits of the steel pen manufactory.

The King of Sweden has been in the habit of commuting the death sentence of murders to imprisonment for life, but the number has increased so rapidly that he lately ceased interfering with the course of the law.

The Duke of Modena just deceased, left that historical Grand Duchy, in his will, to the Holy See.

Marshal McMahon expresses the greatest deference for the new life Senators of France. He was a Senator himself under Napolean III.

Paris modistes and milliners confess that the American fashionables residing in that capital are its life and pocketbook to an appreciative extent.

The London Home for Lost Dogs has kennels for 400. The police send all stray dogs there, and they are kept three days awaiting owners, after which they are either sold or killed.

The Prince of Wales had ten and the Princess five dogs entered at the late dog show at Alexandra Palace; but the nation pays their dog tax. New reading of an old proverb:—English royalty for dogs and children.

Harmony has been restored in the French Ministry.

Sir Garnet Woosely, the hero of Abyssinia has just been making a visit in Rome.

The Duke of Northumberland has given £100 to the Palestine Exploration Fund.

The Emperor of Brazil is to leave Rio Janeiro for New York on the 26th of March.

The Duke of Edinburg is to take command of the Monarch, one of the Channel Squadron.

The London Royal Society has given Le Verrier a gold medal worth 2,000 francs. He has accepted it.

While service was being conducted in the parish church of Cherry Burton, an English village, the other morning, the clock-weight came crashing through the belfry roof and alighted on a young girl, housemaid at the rectory, who was injured beyond hope of recovery. A young man sitting by her was also hurt severely. The rope on which the weight was hung was renewed only the week before. The two injured persons were to have been married the next day.

A letter from Ragusa in the *Golos* relates some horrible incidents in illustration of the cruelty practised by the Turks toward the Christians in the Herzegovina. These outrages, says the correspondent, are overlooked by the officers, it being found impossible to maintain discipline among the troops so long as their pay is many months in arrear, and they are kept on starvation rations. Even the Turkish boys, who are not usually models of humanity, are indignant at the atrocities committed by their countrymen.

Lieut. Murphy whose name is well known in connection with the Cameron expedition into Central Africa, has a companion, also distinguished in African travel. This is the late Dr. Livingstone's dog—the only dog that has survived a journey into Central Africa. This faithful creature traveled from Zanzibar to Unyanyembe with the explorer, and then followed Livingstone's body back to the coast. The dog wears a medal bearing the following inscription:—"Mabel F. R. G. O., late Livingstone East Coast African Expedition, 1873-4." It is a small-sized bull-terrier, white in color, and now in very infirm health. It traveled 11,500 miles in Africa—a wonderful effort in pedestrianism—before it was twelve months old, and it has since traveled 15,000 miles by sea.

Manuel Fernandez, a Cuban agent, has been sentenced to three years' imprisonment in Hayti.

The Porte is willing to entertain the Austrian scheme of reform.

It is reported that Prince Bismarck and the Vatican are coming to terms.

Victor Hugo and Louis Blanc were among the nominations for the French Senate, made by the Council-General of the Seine.

The Republique Francaise (the organ of M. Gambetta) regards the proclamation of President MacMahon Jan. 13, as a confirmation of Republican institutions.

M. Leon Say has instructed his subordinate officials in the Finance Ministry not to connect themselves with the Electoral agitation, to vote according to their convictions, but not to participate in any manifestations either before or after the elections.

The South of India Observer says that the jewels worn by the little Guicowar of Baroda at the landing of the Prince of Wales are estimated at £2,000,000 sterling. The principal features were a plume of diamonds in his turban and a large bunch of pearls fringed with gold. He also wore the famous diamond Star of India, the purchase of which nearly broke the Baroda Exchequer.

The London Standard's Vienna correspondent telegraphs that before Niesic and Duga were revictualed by the Turks the insurgents suffered a defeat which was the severest since the beginning of the war. Six hundred were killed and many wounded. The insurgent commander, Paulovich, who is accused of treason, fled to Cettinie. Niesic is provisioned until May.

A special dispatch from Vienna to the London Standard says the negotiations between the Austrian and Hungarian Ministers on the Bank question have had no result and will be resumed in Vienna.

The Pall Mall Gazette of June 6 has a special telegram from Berlin containing the following: "The semi-official journals having expressed the opinion that the Ultramontane opposition to the Government is abating, the Germania (organ of the Ultramontanes) declares that the assumption is unfounded, and adds, 'The submission to the State in the sense demanded by Prussia is contrary to the fundamental principles of the Church and can never be accorded.'"

The Pall Mall Gazette says that Capt. Brickenstein of the wrecked steamer Deutschland was to leave England for Bremen on Saturday, where he will demand an inquiry into the loss of that steamer.

M. Gambetta has announced his intention of coming forward as a candidate for the Chamber of Deputies in Paris, Lyons, Marseilles, Lille and Bordeaux. His purpose in doing so is to ascertain the judgment of the large cities upon the policy of compromise which he espoused during the latter part of the session. The Moniteur gives notice that the Government will not support Bonapartist candidates in the coming elections. M. Outrey, Minister Plenipotentiary, has gone to Egypt on a special mission. M. Jules de Mohl, the Oriental scholar, and member of the Institute, is dead.

A hurricane in the Philippine Islands caused the death of 250 people and destroyed 3,800 houses.

An armistice has certainly been agreed upon between Church and State. The Roman correspondent of the *Germania* (Ultramontane organ) states that undoubtedly Prince Bismarck is seeking a *modus vivendi* with the Vatican. The *Italia*, a semi-official Roman newspaper, says that the Vatican has charged certain German prelates to report the condition under which the Prussian bishops shall be allowed to submit to the Falk laws.

It is reported in London that Queen Victoria's coming visit to Coburg has reference to the approaching betrothal of her daughter, Princess Beatrice, with a German Prince.

America contributes 39 students to the 488 at Heidelberg this year; England and Scotland 21, and Russia and Switzerland 21 each. The remaining 300 are from Germany. Only nine of the entire number are studying theology.

President McMahon has issued a proclamation in favor of law and order.

There is a great lack of candidates for the clergy, Protestant and Catholic, in Germany. The reason is said to be a falling off in the demand for preaching, caused by the growing prevalence of unbelief.

A pauper inmate of Horsham Workhouse, England, died in the union on Christmas Day from the effects of gluttony. He attacked his Christmas dinner so ravenously that in a few minutes he was choked.

The statement that Prince Frederick William of Germany would visit this country this year was a lie concocted by four Berlin newspaper reporters. They met casually, and invented the report.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Friday, Jan. 15, 1875.

RECEIPTS.—The receipts of Produce for the week were as follows:

Flour, bbls	98,160	Wool, bales	154
Whisky	2,103	Hops, bales	4,076
Corn meal, bbls	1,850	Pork, bbls	3,783
Corn meal, bags	4,200	Cut meats, pkgs	9,153
Wheat, bush	330,080	Lard, pkgs	9,467
Corn, bush	297,000	Tar, bbls	226
Oats, bush	131,931	Tobacco, hhds	483
Rye, bush	672	do. crates	1,129
Malt, bush	14,428	Butter, pkgs	37,105
Barley, bush	7,620	Cheese, bxs	4,832
Beans, bush	2,000	Cotton, bales	28,981
Grass seed, bags	7,819	Rosin	1,154
Ashes, pkgs	64	Suts. lurp., bbls	305
Beef, pkgs	1,504	Dried Fruits, pkgs	259
Peas, bush	11,975	Eggs, bbls	6,532
Beeswax, pkgs	61		

BEANS AND PEAS.—A very large crop of beans and easy shipping weather keep up a heavy line of receipts, and prices continue low and weak. Cheap rates for marrows call out considerable West Indian trade, while a decreased exportation of potatoes allows larger orders of that class to be filled. Medium beans have only a fair demand, buyers calling only as they want stock. We might here remark that buying ahead in any line of produce for grocers' use is a noticeable exception this season. Pea beans, which usually have a sort of special position, have merely a jobbing demand for Eastern use. Kidneys are very quiet at the late shaded figures. Canadian peas are in large supply and going abroad pretty freely for feeding purposes; prices not strong. B. E. peas nominal. Green peas have not their usual winter activity. Lima beans a drug.

We quote Beans, pea, new, prime, $1.50@1.60; other, 1.25@1.35; medium, new, $1.40@1.45; fair to good, $1.15@1.30; very poor, 50@90c.; marrow, new, prime, $1.70@1.75; other, $1.40@1.60; white kidney, prime, $1.85@1.95; fair to good, $1.60@1.70; red kidney, new, prime, $1.50@1.60; fair to good, $1.30@1.45; California Lima, choice, $3.50@4.00. Peas, Canadian, bbls., new, duty paid, $1.25@1.27; bulk, in bond, $1.02; green, new, ₱ bush., $1 60; Southern B. E., ₱ 2 bush. bag, $3.10@3.15.

BEESWAX.—Export trade is moderate, and local business light. Sales at 31½@32c. for Western, and 32@32½c. for Southern.

BROOM CORN.—The offerings are still almost entirely of poor stock, which sells low.

We quote Brush, short green, 9½@10c.; hurl, green, 10c.; green, medium, 6@7c.; red and red tipped, 4@5c.

BUTTER.—The market is still an uninteresting one for producers. City operators seem quite as determined as ever, to let the interior carry the remaining stock. In former seasons, the winter months have been more or less enlivened by some speculative movement. This year there seems to be neither confidence or inclination for operations outside of the actual transfer of stock to the consumers, through the ordinary channel of market-men and grocers. There is a fair demand, but no large purchases, and receipts are just about heavy enough to keep prices tame for the ordinary runs of stock. Fancy late made State is scarce, so are the fine ends of other dates. For such selections 35c. is the generally quoted figure; but the quality has to be in every way right. Grades that have been selling at 25@27c., are still steady, and on some days 23@29c. have been realized for stock between fine and sound serviceable table kinds. At present a free offering of useful State, would find buyers at 25@26c., and sellers think they would be doing justice to the future market, by releasing such at easy, business-pushing rates. As before, adjacent dairymen have sent pails in quite liberally, owing to the prolonged abundant yield of milk; cans of 40 quarts have sold lately at the commission platforms at $1.25@1.75 each! a very low range for winter. Speaking of pails, most of them are off in quality, and 25c. is extreme for the best style now coming forward. Buyers want something that will stand up better than a hurriedly-made article. Western butter is not a feature at present, few parcels are good enough to rate at the extreme. Rolls are lower and tend in buyers' favor.

State dairies entire, extra, 30@—c.; entire, good to prime, 26@28c.; fair to good, 24@26c.; firkins, selected fresh, 28@30c.; good to prime, 25@28c.; fair to good, 24@25c.; half-firkin tubs, selected, 28@29c.; good to prime, 30@32c.; fair to good, 27@29c.; poor to fair, 25@27c.; State, Welsh, tubs, fall made, 30@31c.; dairies, 27@29c.; good to prime, 25@27c.; fair to good, 24@25c.; poor to fair, 22@23c.; Pennsylvania, store packed, 17@20c.; Western, dairy tubs, selected, 26@27c.; good to prime, 24@26c.; tubs selected fresh, 26@27c.; good to prime, fresh, 23@25c.; fair to good, fresh, 21@23c.; poor to fair, fresh, 20@21c.; Western, early packed, selected, 21@22c.; Western, early packed, other, 16@20c. Roll butter, good to prime, 23@24c.; fair to good, 20@22c.

CHEESE.—There has been a fair business in cheese; "something doing" is about the average response from sellers. The neighboring markets are taking home stock, and it is likely that an enlarged business will spring up from the N. E. States, as the purchases thus far from that section have been light. The general sales are at 11@12½c., the latter price buying rating cheese, including many Sept. and Oct. marks. Strictly fancy is quoted at 13@13½c., with small sales for special European orders. The stock of cheese in N. Y. is above the date last season, adding up 251,300 boxes.

New State factory, fancy, 13@13½c.; fine, 12½c.; do. good to prime, 11¾@12½c.; fair to good, 10@11¾c.; poor to fair, 7@10c. State Farm Dairy—fancy, 12@12½c.; good to prime, 10½@11½c.; fair to good, 10½c. Western factory, cheddar, fine, 12@12½c.; good to prime, 11@12c.; flat fine, 12½@13c.; good to prime, 11@12c.; fair, 8@11c.; poor to fair, 6@8c.; English dairy, Connecticut, 12@13½c.; do. State, 17@20c.; pineapple, 16@18c.

COTTON.—The foreign markets are against export trade, and with large supplies coming to hand, at the ports prices are easier. Latest sales are of January, 12 31-32@13c.; February, 13 5-32@13 3-16c.; March, 13 13-32@13 7-16c.; April, 13 21-32@13 11-16c.; May, 13¾@13 29-32c.; June, 14 1-16@14 3-32c.; July, 14¾@14 9-32c.; August, 14 11-32@14¾c.; barely steady, showing, as compared with yesterday, the following changes, all lower: January, 1-32@1-16; February, 1-32c.; March, 1-32c.; April, 1-32c.; May, 1-32c.; June, 1-32c.; July, 1-32c.; August, 1-32c.

Quotations for spot cotton, based on American standard of classification:

	Uplands.	*Ala.*	*Orleans.*	*Texas*
Ordinary	9¾	9¾	9¾	9¾
Strict ordinary	10 11-16	10 11-16	10 11-16	10 11-16
Good ordinary	11 5-16	11 5-16	11 7-16	11 7-16
Strict good do	12	12	12⅛	12⅛
Low middling	12 7-16	12 9-16	12 11-16	12 11-16
Strict low middling	12⅞	13	13⅛	13⅛
Middling	13¼	13¼	13 5-16	13 5-16
Good middling	13⅝	13⅝	13½	13⅝
Strict good middling	14	14⅛	14⅛	14⅛
Middling fair	14⅜	14¼	14⅜	14⅜
Fair	15¼	15⅛	15⅛	15⅛
	Stained.			
Good ordinary	10⅛	Low middling		12⅜
Strict ordinary	11⅛	Middling		12¼

DRIED FRUITS.—A few small lots are being taken by neighboring markets at steady prices. Blackberries scarce and higher. Peaches dull and unsettled. Apples—State, sliced, 10@10¼c.; quarters, 9¼@9½c.; Western quarters, 8½@8¾c.; Southern sliced, 1875 crop, 9¼@10c. for prime, and fancy 12c.; Tennessee quarters, 8@8½c. Blackberries, new, 12½@13c. Peeled peaches, good and prime Georgia, 14@16c.; do. fancy, 18c. Unpeeled peaches, new, 12c. for halves, and 11c. for quarters. Plums, 20c. Raspberries, 28@30c. Cherries, 24@25c.

EGGS.—Supplies have been very liberal for the period, and, as the warm spell had no good effect upon the stored supply, holders have been trying to work off a good many old lots. The market has ruled rather easier; but, with our first installment of real cold weather, sellers have more confidence. As the rate of receipts must naturally diminish. Limed are scarce. This has been one of the alternating profitable season for packers. Salt packed eggs are not desirable, as they soon fall off in quality after being taken out.

Jersey and Pennsylvania, single bbls., ₱ doz., 30@32c.; State, 29@30c.; Western, prime, 28c.; do. fair marks, 22c.; Canadian, 28c.; Southern, 27c.; Limed, State, prime, 25@27c.; do. Western, good to prime, 24@26c.

FLOUR.—There have been large purchases on export account, particularly for the West India market, and prices have been well maintained.

Superfine State, $4.25@4.65; extra do., $4.40@5.00; superfine Western, $4.25@4.65; extra do., $4.90@5.00; No. 2, $3.30@4.00; extra round-hoop Ohio, $4.95@5.30; trade brands do., $5.35@7.40; white wheat extras, $5.95@7.00; St. Louis, $5.50@9.00; City Mills extra, $5.15@6.75; Southern, at $4.15@4.60 for superfine; $4.80@6.30 for poor to choice shipping extras; $6.10@8.75 for trade and family brands. Rye flour at $4.50@5.25. Buckwheat selling 55@60c. and flour at $1.50@2.30. Corn meal at $3@3.50 for yellow Western; $3@3.40 for white do.

FRESH FRUITS.—In apples, spys and greenings have kept poorly, and it really looks as though the lots will go through the season as well as a short crop ought to. Prices for loads from lofts are easier; only picked out for table or retailing. Fruit will bring the highest prices lately quoted. Whoever owns the remnant of grapes will have to pocket a loss. Some of the best marks have become shrunken and otherwise unsightly. Just as soon as domestic fruit of any kind begins to look shabby hlongarls of foreign stuff, and if the latter is quoted reasonably low, and such is now the case, the former is neglected. Cranberries continue firm at the late advance, boxes selling fairly for local use, the West using bbls. Peanuts are steady; though pretty free receipts check anxious buying. Hickory nuts are only moderately wanted.

Apples.—Spitzenbergs and Baldwins, fine, $3.50@4; Greenings, $3@3.50; mixed, good, $2.50@2.75; do. fair, $2@2.25. Pears—Choice Cal., ₱ box, $4@4.50. Cranberries—Jersey, choice, bush. crates, full measure, $3@3.25; good to prime, $2.75@3; good to choice, ₱ bbl., $8.75@9.75; Cape Cod, fancy, ₱ bbl., $9.75@10.25; Eastern, fancy, $9.75@10.25; good to prime, $8.50@9.50. Nuts—Peanuts, Virginia, $1.40@1.50; do. Wilmington, $1.70@1.85; do. Tennessee, 75@80c.; Hickory nuts, $1@1.25.

FURS AND SKINS.—The tone of the market is weak. Recent quotations nominal. We quote prime skins.

Bear, Northern, as to size and quality	$10 00 to 15 00
Bear, Southern and Northern yearlings	5 00 to 10 00
Beaver, Northern, per skin	2 50 to 3 50
Beaver, Western and Southern	1 50 to 2 50
Badger	20 to 50

GRAIN.—In wheat there have been larger dealings on export account, and a smoother market. Latest sales at $1.12¼ for No. 3 Milwaukee spring; $1.45 for choice old amber Michigan in store; $1.20@1.30 for red Western; $1.24 for old No. 2 Chicago spring in store; $1.12@1.20 for ungraded spring; 98@99c. for thin rejected spring; $1.09 for New York No. 3 spring, in lots, and $1.45 for amber Pennsylvania; $1 18@1.45 for winter red and amber; $1.62@1.62½ for white, and $1.32@1.40 for No. 1 spring. Rye at 95@97c. for State. Corn is unsettled and pressing the buyer. Sales at 65¾@67c. for new mixed Western, N. Y. inspection, afloat, closing at 66c. for prime; 65¾@66c. for new low mixed; 65c. for "no grade" new mixed, N. Y. inspection, afloat; 66¾@67c. for new yellow Western; 72@72½c. for old mixed, afloat; 72@72½c. nominally for old yellow Western; 65c. for new yellow Southern; 66c. for new Southern, and 63c. for old white Western. Oats are in lighter receipt and firmer. Sales at 49¾@51c. for white State; 45½@47c. for mixed Western.

HAY AND STRAW.—Prices have been advanced on small receipts and a good demand.

Bale hay is quoted:—Shipping, 85c.; retail qualities, $1.05@1.20; clover, 70@80c.; salt, 65c. Straw is quoted at $1.10@1.20 for long rye; 80@90c. for short rye; 75@85c. for oat.

HIGHWINES are selling at $1.11.

HONEY continues depressed. Present quotations ought to start it if it is going to start this season.

White clover, in glass boxes, ₱ lb, 18@22c.; buckwheat, 10@18c.; strained, 10@12c.

HOPS.—There is no change in the market here. Exporters are doing but little, but for the choice stock required, pay full unchanged prices.

New York State, 10@15c.; Eastern, 10@15c.; Wisconsins, 10@15c.; Yearlings, 8@10c.; Olds, all growths, 4@6c.; Californians, 17@20c.

MILK.—The price paid to farmers for Dec. was 4@4¼c., in a few instances, 4½c.

POULTRY AND GAME.—Dressed poultry is stimulated by the seasonable weather, though, after the cheap season, we have passed, it is not easy to teach buyers to pay the comparatively higher prices. A rush of dressed would certainly drop prices. We quote:

Turkeys, N. J., choice, 19@20c.; do. other, 16@18c.; State and Western, choice, 17@18c.; do. other, 13@15c. Chickens, N. J., 18@20c.; State, as to quality, 16@18c.; Western, 15@17c.; Bucks Co., 19@20c. Ducks, N. J., good to prime, 18@20c.; State, do., 16@18c.; Western, do., 15@17c., fair to good, 12@15c., poor, 8@12c. Geese, N. J., prime, 13@15c.; State, good to prime, 10@12c.; Western, do., 8@11c.; do., poor to fair, 7@8c.

Live poultry has kept well, sold up at very good prices for winter.

Fowls, Jersey, 14@15c.; Western, 13@14c. Chickens, 10@11c. Roosters, 6@9c. Turkeys, Jersey, 14@16c.; Western, 12@14c. Ducks, Jersey, ₱ pair, 85c.@$1.25; Western, 55@70c.; Jersey, $2@2.50; Western, $1.25@1.62.

This is the last week for venison. The season has been a poor one, as a whole and closing prices are very low, owing to the large surplus the warm spell kept on the market. Other large game has little inquiry. Quail and Grouse are in good demand, as the market has been nearly bare several times, as shippers would not hazard supplies. Wild ducks when in prime order, sell well. Squirrels do not pay for sending.—We quote:

Quail, trapped, prime, ₱ doz., $2.50@3.00; soft, $1.25@1.50. Grouse, prime, ₱ pair, $1.00@1.10; drawn, 75@85c. Partridges, choice, ₱ pair, 75c.@$1.00; other, 50@75c. Hares, ₱ pair, 20@30c. Rabbits, ₱ pair, 20@30c. Venison, short saddles, ₱ lb., 9@10c.; long saddles 6@8c.; whole deer, 7@8c. Canvas back ducks ₱ pair, $1.50@2.50—the higher price for thivre de Grace, Mallard, 70@80c.; Red Head, 80c.@$1; common, 40@50c.

PROVISIONS.—Generally the market is weak on account of the heavier arrivals of hogs at the West. Quotations are for mess pork, $21; extra prime, $16; prime mess, $19.50@20,. Dressed hogs 7c 8¾@8¾c. for Western. Boxed dry salted shoulders, 8½@8¾c. Tierced pickled hams, 12½c. for 13 lb. average. Bacon at 11¾c. for Western long clear, 11¾c. for short clear, 11¾c. for long and short clear, half-and-half. Lard—Western steam at 12¾c. for spot and January, 13c. for February, 13 3-16 for March. Stearine at 13c. for Western. Beef hams, $24. Beef, new extra mess, $12@12.50; do., plain mess $11@11.50; new tierced at $23 for prime mess, $25 for India mess. City extra India mess, $30.50@32. Old extra mess, $11.50, and $10.50 for plain mess; packet, $15.50@16.50.

SEED.—Clover is scarce and wanted. Selling at 13¾@13¾ for prime.

TOBACCO.—At the reduced prices there is very little doing; exporters disposed to take any small lots. Quotations are:

KENTUCKY LEAF.	Light. Cents.	Heavy. Cents.

VEGETABLES.—Farmers were fortunate in not holding potatoes "for a rise" this season, as no circumstance seems to have the power to get them out of the low rut they have run in so long. Unless trade opens soon or consumption enlarges there will be some great slaughter in the spring. Onions are firm. Early Rose, bulk, ₱ bbl., $1.00@1.25; Peach Blows, $1.50@1.75; Prince Alberts, $1.00@1.25; Peerless, 65c.@$1.00. Sweet potatoes, $1@2.75. Cabbages, ₱ 100, $3@5; red, $6@10. Cauliflower, bbl., $2@3. Squash, Marrow, bbl., 50@75c.; Hubbard, $1.25@1.50. Onions, red, bbl., $1@1.50; yellow, $1.00@1.75; white, $2.50@2.75. Russia Turnips, ₱ bbl., 75c.; white, 60c. Carrots, $1.00.

WOOL.—Business still drags, there being a feeling of distrust occasioned by the few failures among manufacturers and dealers noted latterly. Prices are held firmly.

COUNTRY CHEESE MARKET.

LITTLE FALLS, N. Y., Jan. 15, 1876.

THERE is a firmer feeling in the market this week, though there is no material change to note in prices since our last report. Among the farm dairy cheese we hear of nothing being offered but "odds and ends"—small lots, the close of the season's make. Prices range at 7@8½c., with occasional sales at a cent higher figure.

The market for factories continues to be dull, and the views of holders are generally above those of buyers. There is no really fine cheese on the market, as current rates are supposed to be below real values. Dairymen are hopeful of the future and are firmly holding all fine cheese for better prices than can now be obtained. The "late ends" of factories may be quoted at 9@10½c., and fine September and October at 11¾@13½c. The quantity of cheese now back in Herkimer County is quite small and no more than is usual at this season of the year.

Winter butter is still coming forward; but it is of variable quality, mostly common and low grades. Sales are made at 23@25c., according to quality.

Abortions among the herds are becoming more frequent, but in other respects stock is healthy and is wintering well. Cows are now being rapidly dried off their milk and only a few factories are running.

There was a heavy rain storm in Herkimer on Sunday, which swept off nearly all the remaining snow; but on Monday the weather turned cold, with high winds, and we are now having snow.

Our usual weekly letters from abroad have failed to reach us this week.

LIVE STOCK MARKETS.

NEW YORK, Jan. 15, 1876.

BEEVES.—On last Monday forenoon trade opened fair on a moderate run of horned cattle; quality coarse to choice, with the aggregate of the herds in hand of fair quality. Prices were 7@13½c. ₱ lb.; weights, 5¼@12 cwt., on a continuous light run of beeves. Wednesday, trade was brisk at 9@12½c. ₱ lb.; weights, scant 5@10 cwt. Thursday, sales fair at 9¾@12½c.; weights, 6@8 cwt. Friday, the markets closed firm at 11¾@13½c.; weights, 6¾@9½ cwt. From 55@58 lbs., net, have been allowed to the cwt. Spanish herds direct from the Plains sold at 7@9¾c. ₱ lb. Native steers, 8@12¾c.; grade do., 12¾@13½c. Oxen, $@12¾c. Dry cows and heifers, 9@11c. Mixed herds, 9@11¾c. Bulls, live weight, 4@4¾c. Yearlings, $18@19 ₱ head.

COMPARATIVE RATES.

Quality.	This week. Cents.	Last week. Cents.
Good	12 @13¾	12 @13¾
Fair	11 @11¾	11 @11¾
Poor	10 @10¾	10 @10¾
Poorest	7 @ 9¾	7 @ 9¾
Gen. selling rates	10 @11	9¾@11

MILCH COWS.—Trade rather easier and sales more numerous. Six cows sold at $55 ₱ head; 3 at $65; 11 at $60@75; 3 at $70@82; 5 at $79@92—calves always included.

VEALS AND CALVES.—Smooth quality veals nominal at 9@11c. ₱ lb. Meal-fed calves, quality coarse, 6c.; grass calves slow of sale at 4@5c. ₱ lb.; also at $9@12.25 ₱ head.

SHEEP AND LAMBS.—Monday sheep sold at 4¾@7¾c. ₱ lb., Lambs in demand at 7@8¾c. ₱ lb. Wednesday, on a heavy run, trade fell off; Sheep slow at 5@6c.; lambs not quoted. Thursday, sheep, 5¾@7¾c.; Friday, the markets closed dull, with sheep at 6¾@7¾c.; lambs, 8c. Michigan sheep sold at 6¾@7¾c. ₱ lb.; Pennsylvania, 6@7c.; State, 5@7c.; Kentucky, 5¾@7¾c.; Ohio, 4¾@7¾c.; Illinois, 5@6¾c. State lambs, 7c.; Canada, 8@8¾c.

HOGS.—Trade in live very small. One car load of Ohio hogs, weight 198 lbs. ₱ head, sold at $8 ₱ cwt. City dressed have fallen in price and sales increased in numbers. Monday, prices were 8¾@10¾c.; Wednesday, 9¾@10¾c.; Thursday, 9¾@9¾c.; Friday trade very slow at 9@9¾c. Western dressed dull at 8¾@9c.

HORSE MARKET.—The unusual fairness of the weather has allowed of the easy sale of roadsters, 29 head of which, with moderate trotting action, sold at $225@375 ₱ head; 18 poor quality light harness horses, $50@85 ₱ head; 10 ordinary quality, do., $150@215 ₱ head; 3 pairs family carriage horses, $350@435 ₱ pair; 1 pony, $110; 1 pair do., $475—quality good; 7 head of heavy draught horses, $200@350 ₱ head—quality course. Fifteen horses arrived ₱ Erie Railroad, via. Oak Cliff Station.

AN INDUCEMENT!

A Good Way to Secure a Practical and Scientific Library.

WE have made a selection from our Publications of the following Standard Works, which we offer to subscribers in conjunction with the RURAL NEW-YORKER, at the extremely low rates below. These works are by men who have a national reputation in their various specialties, and we feel sure that we are conferring a double service when we offer the best Agricultural and Family Journal, *and* a Valuable Book, at little more than the cost of either alone.

We will send one year (postage prepaid on both), the

Rural N.-Y. and Willard's Dairy Husbandry, for		$5 00
"	Randall's Practical Shepherd	4 00
"	Allen's American Cattle	4 00
"	People's Practical Poultry Book	3 50
"	Quinn's Money in the Garden	3 50
"	Willard's Practical Butter Book	3 00

MOORE'S RURAL NEW-YORKER, conducted by our jolly friend, Hon. D. D. T. MOORE, leads all the papers of its class in this country. It is edited with great care and has a large variety of interesting and instructive departments for the family and the fireside. Convenient in form, remarkably neat in typography, abounding in timely illustrations, and well filled with the choicest of matter, both original and selected, it has no superior in its peculiar sphere.—*Yonkers Gazette.*

PERSONAL ITEMS.

GLADSTONE is 66 years old.

SANKEY'S voice is failing.

THE Pope blessed a Milwaukee girl's voice.

POST-MASTER GENERAL JEWELL has rheumatism.

THE Senate eulogized Andrew Johnson, Jan. 11.

GEN. BABCOCK'S trial begins about February 1.

EX-SENATOR BEN WADE of Ohio, is in Washington.

BANCROFT DAVIS, Minister to Berlin, has gone to Egypt.

J. FORSYTH edits his paper and serves in the Alabama Legislature.

JOHN LEE CARROLL was inaugurated Governor of Maryland, Jan. 12.

DR. S. G. HOWE of Boston, (husband of Julia Ward Howe), is dead.

LA GUERRONNIERE, Napoleon III.'s famous pamphleteer, is dead.

DR. A. BORRERO took office as President of Ecuador on the 9th ult.

LEOPOLD VON RANKE, the historian, attained his 80th birthday on Dec. 21.

MR. BAUER of Newark, N. J., has recently lost 8 children by diphtheria.

MR. TILTON is very moderate in his price, only asking $150 for his services.

MRS. GRANT wears black silk and velvet. Mrs. Fred. Grant wears opal silk.

COL. J. W. FORNEY will return from Europe about the middle of February.

DORE has completed a series of illustrations of Coleridge's "Ancient Mariner."

SALVINI has been married in Florence, to an English lady named Miss Lottie Sharp.

PRESIDENT PORTER of Yale College has recovered his health sufficiently to return to his duties.

MISS CHARLOTTE CUSHMAN is said to be writing a book of personal reminiscences of the stage.

JAMES MALETTE, formerly of the Binghamton Republican, has purchased the Geneva Courier.

BOSTON has made a loud call for the able and earnest blacksmith preacher, Robert Laird Collier.

MRS. POLLY JEROME, New London's "oldest inhabitant," is 98 years old, and has 98 descendants.

BISHOP HAVEN (Methodist Episcopal) is in New Orleans, where he will remain during the present month.

THE Rev. C. D. Helmer goes from Chicago to the Tompkins Avenue Congregational Church in Brooklyn.

GOVERNOR-GENERAL DUFFERIN is Commodore of the Nova Scotia Yacht Squadron, just organized at Halifax.

SWINBURNE, the poet, has renounced Romanism, in which faith he was born, and joined the church of England.

GRACE GREENWOOD'S husband, Dr. Lippincott, has become chief clerk in the Land Office at Washington.

THE Marquis of Ripon, who recently joined the Roman Catholic Church, has presented the Pope with £10,000 sterling.

MR. A. J. PARKER of Albany has given $50 to the Mayor to be used in buying bread for those who cannot obtain work.

COL. J. W. FORNEY will return from Europe about the middle of February and resume editorial charge of the Philadelphia Press.

THE Louisiana House, with the aid of twelve Senators, chose Mr. Enstis for United States Senator, to contest Mr. Pinchback's place.

T. ROGERS JOHNSON, for many years Grand Secretary of the Independent Order of Odd Fellows of California, died at Santa Barbara, Jan. 11.

THE New Hampshire Democrats nominated D. Marcy for Governor, on a hard money, non-sectarian schools, and anti-third-term platform.

HER MAJESTY Queen Victoria is expected to arrive in Coburg about the 10th of April next. She will probably go thence to Baden Baden.

LARKIN G. MEAD'S statue of Ethan Allen, which is in the possession of the State of Vermont, will probably be exhibited at the Centennial Exposition.

BISHOP HUNTINGTON of Central New York thinks the exclusion of the Bible from the public schools "is foredoomed by circumstances that are to be deplored."

SIR E. THORNTON, the English Minister, by his habit of taking a walk of six or eight miles a day, is said to have made pedestrianism fashionable at Washington.

THE Rev. James Houston Eccleston, D. D. of the Church of Our Savior, Philadelphia, has been called to the rectorship of St. Ann's Episcopal Church, Richmond, S. I.

DONN PIATT and Congressman Banning are among the heirs of the late Timothy Kirby of Cincinnati, who has left property valued at between $2,000,000 and $3,000,000.

THE Hon. William Welch of Madison, Wis., proposes to give each man twenty-one years old one vote, each man of forty-two years two votes and each man sixty-three years old three votes.

PROF. STALEY of Union College, accompanied by his wife, has sailed for Europe, to be absent till next fall. They will visit Egypt, Rome and Berlin, to collect art specimens for the new Memorial Hall of the college.

GEN. J. M. READ, our Minister to Greece, is said to be writing a history of that country, upon which he expects to be engaged four or five years. It will be the fullest and most complete history of Greece ever published.

MOORE'S RURAL NEW-YORKER.—This king of Agricultural papers has entered upon its twenty-sixth year, under the most favorable auspices. It is the determination of its publishers to furnish a brighter and better paper than ever. In style, type, matter and editorial ability, there is no paper of its kind that at all compares with it.—*Tremvealeau (Wis.) Republican.*

New Publications.

GRICKET ON THE HEARTH,
The Largest, Handsomest, Best and Cheapest Paper of its Class in the World.
THE CRICKET ON THE HEARTH is a mammoth 16-page, 64-column paper (size of "Harper's Weekly"), handsomely printed, profusely illustrated, and filled with the choicest reading for old and young. It contains splendid continued and short stories, sketches, poems, wit and humor, useful knowledge, valuable receipts, "Farm and Household," "Hygienic," "Popular Songs," Games, Puzzles, etc., etc. It is emphatically
A Paper for Everybody
and gives more for the money than any other. The price is
Only One Dollar a Year,
and to every subscriber is presented our new and elegant premium,
"Gems of American Art,"
a mammoth portfolio containing six large and exquisite engravings. It is enough to say of this premium that it was executed for us by the "Aldine Company," and that the illustrations are perfect transcripts of the largest and finest that ever appeared in The Aldine. This portfolio is certainly worth not less than two dollars. Price of paper without Premium, seventy-five cents a year.
We will also send the paper THREE MONTHS ON TRIAL FOR ONLY 15 CENTS. Address
F. M. LUPTON & CO., Publishers,
37 Park Row, New York.

DON'T GO WEST. Maryland and its advantages. Descriptive Catalogue of cheap farms free. *J. C. Plummer*, Cambridge, Md.

MOORE'S RURAL NEW-YORKER is one of the readable, useful, family papers, equally in demand by the lady in her conservatory, the matron with her household, the farmer in his field, the stock raiser among his animals, and the young folks around the evening lamp.—*Laws of Life.*

NEWS CONDENSER.

— Binghamton wants a new cemetery.

— England now has spelling matches.

— The direct cable is repaired and again doing business.

— Eight murderers are waiting to be hanged in Missouri.

— Binghamton is in danger of having a hemlock opera house.

— The temple of Juggernaut is being destroyed by a banyan tree.

— Michigan has 113,413 farms under cultivation, containing 10,213,692 acres.

— England proposes laws for purifying rivers. Manufacturers oppose them.

— A street car moved by condensed air pressure has been successfully tried in Paris.

— The National Republican Convention has been fixed for June 14, at Cincinnati.

— The Spanish Government has authorized the publication of fourteen new journals.

— There are five ships now building at Kennebunkport, from 1,000 to 2,000 tons each.

— A nail factory at Cortland, N. Y., has received an order for 300,000 tons of horse shoe nails.

— Trouble is brewing between Nicaragua and Costa Rica on account of the boundary question.

— The Judicial functions of the Canadian Supreme Court went into effect on Tuesday week.

— Prairie du Chien has an artesian well 717 feet deep which throws up 30,000 barrels of water a day.

— In the multiplex telegraphy test, at Milwaukee, recently, sixteen messages were on the wire at once.

— The Spanish steamer Algeria has been wrecked off Cabras, Porto Rico, and six lives have been lost.

— The statue of Burns will be erected in Central Park, New York, this year during the Centennial festivities.

— The New York, New Haven and Hartford Railroad Co. has re-elected the old Board of Directors.

— The Niagara Fruit Preserving Company of Lockport, put up 250,000 cans of fruit during the past season.

— About 1,400 miles of new railroad will be completed this year, which is much better than was expected.

— On and after the first of February visitors will not be admitted to the Centennial grounds without a pass.

— Twelve thousand dollars' worth of dried fish are every month sent from San Francisco to China by the Chinese.

— Three children named Peaubin were drowned near Arichat, C. B., recently, while drawing a sled on the ice.

— An incendiary fire at Murphysboro, Ill., destroyed half a block of buildings. Loss, $15,000. Small insurance.

— A flood in Valparaiso inundated the business part of the city and destroyed two lives and $1,500,000 worth of property.

— Public functionaries receiving over £500 a year are disqualified, by royal decree from sitting in the Spanish Cortes.

— Twelve grocers were held in bail in the Essex Market Police Court, N. Y., on the 12th inst., for selling adulterated milk.

— It has been decided to begin the Channel tunnel at St. Margaret's, near Dover, next April, by opening a trial cutting.

— The United States Senate has adopted resolutions declaring that it has the power to remove its President *pro tempore* at will.

— India has not a single port on the vast seacoast line between Bombay and Calcutta where a vessel could discharge her cargo at a pier.

— A despatch from Sacramento, Cal., says that a land-grab scheme has been unearthed by which the State is the loser to an enormous amount.

— The Albany Law School has in the class of '76, three married men; one ex-assemblyman; one ex-district attorney one ex-sheriff, and one ex-mayor.

— Rochester is troubled with youthful burglars. Four of them broke into a candy store Jan. 10th, and stole thirty pounds of candy. Two of them were arrested.

— The first passenger train passed over the London, Huron and Bruce Railway, from London to Wingham, recently. The formal opening of the road took place.

— St. Louis, Chicago, and Philadelphia are struggling vigorously for the National Conventions, and St. Louis offers the largest room in the country for the purpose.

— The young ladies of Burlington, Iowa, lured the unwary youth to call on New Year's by gifts of flowers. One bevy of fair ones distributed 75 bouquets. It's leap year, though.

— A convention for the purpose of pushing forward the Centennial education movement among the Baptists of the "Southern Tier," is to be held in the First Baptist Church, Binghamton, N. Y.

— The Boston & Albany Railroad Company began, January 1, to weigh the coal and measure the wood and oil issued to each engine, in order to ascertain the actual cost of running each locomotive.

— The Wisconsin Legislature met in Madison, Jan. 12. Mr. S. S. Fifield of Polk was elected Speaker of the House; Mr. R. L. D. Potter, author of the Potter law, was chosen President pro tem. of the Senate.

"In fact, the Galaxy is a 'Star' magazine."—Commercial Bulletin, Boston.

THE GALAXY

For 1876.

IN THE NEXT NUMBER WILL BEGIN

GEN. GEO. A. CUSTER'S

Reminiscences of the Late War.

These articles, it is believed, will be second only to "Gen. Sherman's Memoirs"—as vivid pictures of army life and startling adventure.

The Serial, "Madcap Violet," by WM. BLACK, author of "A Princess of Thule," began in the last number of the GALAXY.

THE GALAXY FOR 1876

Will contain Articles by

ALBERT RHODES, JUSTIN McCARTHY,
RICHARD GRANT WHITE,
HENRY JAMES, Jr.,

And all the leading Writers.

IT IS THE

BEST AMERICAN MAGAZINE.

No Family can afford to do without it.

PRICE $4 PER YEAR.

Wit and Humor.

SPARKS AND SPLINTERS.

LEAP year. Select your victims, ladies.

OLD-FASHIONED PULL-BACK—Driving a pig to market.

A WESTERN man says that figures won't lie unless they happen to be on a gas meter.

JUDGE VIRGIN belongs to the Supreme Court of Maine. He should hold only maiden assizes.

A GREENY named Clark has prepared a Boston Blue Book, which he hopes will be read all over.

FIFTEEN million brooms are annually manufactured in the United States. And yet men will get married.

WHAT is the difference between a hill and a pill? One is hard to get up, and the other is hard to get down.

AN Irish editor says he can see no earthly reason why women should not be allowed to become medical men.

"ASTONISHING cure for consumption," as the old lady said when she sprinkled snuff on the victuals of her boarders.

You can tell a lady who has a seal-skin sacque from one who hasn't. The one who has one has to run down to the stores twenty times a day.

THE Oakland (Cal.) Gas Company has been petitioned to paint the street lamp posts white, so that that they may be found readily on dark nights.

DELIVER us! A restaurant keeper in Park Row in this city advertises on his bulletin—"Fresh sausages from Kat(-)onah, Westchester County." Who wants them?

No Chinese bank has failed for five hundred years. When the last failure took place the officers' heads were cut off and flung into a corner with the other assets.

A CONNECTICUT cow committed suicide last week. Her owner left his gun against the barn yard fence, and what did that cow do but knock it down and discharged it into her neck.

KANSAS teacher—"Where does all of our grain product go to?" Boy—"It goes into the hopper." "Hopper! what hopper?" "Grasshopper!" triumphantly shouted the boy.

A SWEET little boy, only 8 years old,—bless his little heart!—walked into a scene of a teachers' examination at Oswego, last week, bawled out: "Annie, your fellow is down to the house!"

"No one would take you for what you are," said an old-fashioned gentleman, a day or two ago, to a dandy, who had more hair than brains. "Why?" was immediately asked. "Because they cannot see your ears."

A Miss of 10 or 11 on her way to school, was heard saying to herself:—"A noun is the name of any person, place or thing, and if any of the girls have hooked that apple from my desk, I'll raise a fuss with the whole school."

IT is a vulgar error to suppose that there are no Irish characters in Shakspeare. Does not Hamlet exclaim, "How might I do it, Pat, now he is praying?" To say nothing of O'Thello, Cory O'Lanus and the lady O'Phelia.

A GENTLEMAN questioning a little boy, said: "When your father and mother forsake you, Johnny, do you know who will take you up?" "Yes, sir," said he. "And who?" said the friend. "The police," was Johnny's reply.

"How did you like my sermon?" said a vain clergyman to a distinguished chance listener. "Ah, sir, there was one beautiful passage." "Yes, yes," said the dominie delighted, rubbing his hands; "and what was that." "The passage from the pulpit to the vestry."

"WHAT can you say of the second-law of thought?" Student.—"It cannot both be and not be. For example, the door over there must be either shut or open. It can't be both shut and open?" Tutor—"Give another illustration," Student.—"Well, take the case of another door."

A MAN who inquired if anybody had seen anything of his little boy, and then said he was looking for him, stopped at a White street grocery, yesterday, at 3 o'clock, and talked till about 5 o'clock, when he struck out again in search of his son with a touching exhibition of paternal interest.

WHEN a Little Falls wife remonstrated with her husband for staying out late at night, he retorted:—"You got me in the way of it. Before we were married you used to throw your arms about my neck at three o'clock, and say, 'Don't go, darling, it is early yet;' but now if I happen to stay out till two it is a terrible affair."

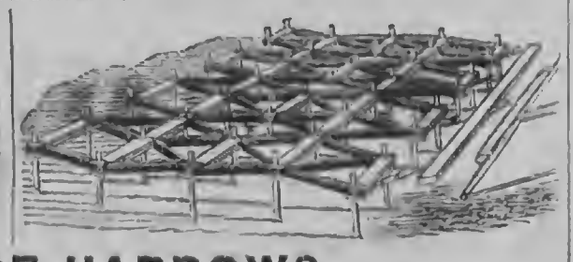
TWO REASONS WHY.—While some boys were skating on one of the slips up the river, a gentleman noticed one on the bank who looked on longingly but who had no means of enjoying the sport. "Well bub, haven't you any skates?" asked the man. "No, sir." "Why not?" "'Cause mother says I ain't prepared to die, and father says he needs the money to buy him some undershirts!" was the lonesome reply.

CONGENIAL COOLNESS.

REGY says that he infinitely prefers putting on HER skates for his Kate to putting on HIS skates for his skating. And KATE says she feels sure REGY is trying to pay her an ICE compliment.

BRADLEY'S REVERSIBLE HARROW.

(CARHART'S PATENT.)



THE KING OF HARROWS.

New and Novel. Tried and Approved. As indispensable to the Farm as a Plow. Its peculiar construction *insures lightness of draft and great strength.* Is universally admired; the common expression is, "*Just the thing we have been looking for.*" Sells at sight, as it supplies a want long felt, viz., A perfect Smoothing Harrow, combined with a first-class vertical or straight Tooth Harrow, at a price usually charged for a Smoothing Harrow. By drawing from one side (as shown in cut), we have a 4-section, hinged, 40 steel tooth Harrow; and by simply changing the draft to the opposite side, we have a perfect Smoothing Harrow. We also manufacture for the West a Harrow of the above description in 6 sections, for four horses abreast, which covers 18 feet of ground in width. Send for Descriptive Circular to BRADLEY MANUFACTURING CO., Syracuse, N. Y.

Consumers Importing Tea Co.,
No. 8 Church Street.
P. O. Box 5,509. New York City.

This is a combination of capitalists to supply the consumers of Teas throughout the United States on the mutual principle.

We have experienced agents in all the best districts of China and Japan to select Teas especially for our trade.

We expect every consumer of Teas to render us all the assistance they can in carrying out our enterprise, as we make a specialty of SUPPLYING CONSUMERS ONLY (and allow no middlemen to make any profit on our importations), which will enable us to supply them with Teas at prices lower than have ever been known, and of those fine qualities that seldom reach the interior, being sold only to the large cities and among the very wealthy.

Hoping the consumer will take an interest in our enterprise, and send at once for a circular with full explanations of how to proceed to obtain our goods, we remain,

Most respectfully yours,
Consumers Importing Tea Co.,
No. 8 Church St.,
P. O. Box 5,509. New York City.

Entered, according to Act of Congress, in January, 1874, by the Consumers Importing Tea Co., in the Office of the Librarian of Congress, Washington, D.C.

Village and Suburban.

VILLAGE AND SUBURBAN ROADWAYS.

In a late number of the RURAL you gave a petition to the Legislature of your State on the subject of Highways, or country roads. This is well, for there is, as you say, great need of reform in the matter. But a great many of your readers, who live in villages and the suburbs of cities, and do but little traveling except by rail, are most interested in city streets and village and suburban roadways. Therefore, while advocating the improvement of country highways, please do not forget that there is abundant room for reform elsewhere, especially in village streets and roadways.—A MICHIGAN VILLAGER.

OUR correspondent is right. There *is* room for improvement in village and suburban roadways, as well as in country roads, and we trust reform in both will ere long be instituted. Perhaps we cannot better respond to the above, at present, than by giving the following illustrated article on Village and Suburban Roadways, originally contributed to the RURAL by F. R. ELLIOTT of Ohio. We hope its publication will elicit discussion on the subject, and lead to marked improvements in many localities during the ensuing season:

A large amount of labor and money is yearly expended on the construction of roadways, planting of street trees, etc., but rarely is it done with any thought relative to the future, or even the present, improved value of the abutting property. In the rural districts the control of what shall be done from year to year is left with the Roadmaster, or Supervisor, as he is termed, while the suburban roads of cities are generally lined and the work directed by the City Civil Engineer. I will not pretend to say these officials are all ignorant of the true system of road-making, or that they are void of any appreciable effective results that may be made to accrue from their direction of the expenditure of labor and money; but I do say that too many instances are to be met with when, had more thought of the present wants of the people, the economy of road-making and keeping, etc., been exercised, the results would have been different.

There are several points in road-making that to me appear all important—these are, *first*, to secure a dry road-bed, and at the same time so arranged that its drains may serve to drain the surface of the abutting property. *Second*, to consider the probable wants of travel and make the road-bed no broader than is really necessary. *Third*, to consider the position of the abutting property and judge at what grade the road-bed should be to give it the most commanding or elevated appearance. *Fourth*, at what distance from the center of the road should trees be planted for street shades.

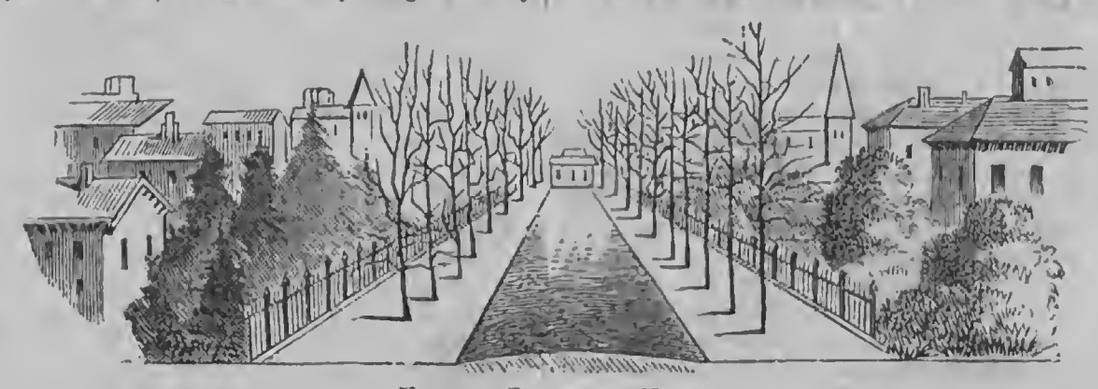
It is a common practice to form the road according to the natural surface of the ground, making it narrow in some places and wide in others, and then the occupants along the line plant shade trees according to their fancy as to distance. Figure 1 shows a street according to this common practice—a street that has no definite character in appearance, and whose road-bed is rarely in condition to drive over without winding about from side to side in order to avoid the various mud holes that are there as a necessity, because either the breadth of the road is too great for the manner of drainage, or possibly there is no definite drainage line constructed.

The actual roadway here allowed varies from forty-five to fifty feet, but has in fact but one track about eight feet wide over which there is travel; this line, however, being changed from time to time during the year, according as it is passable or impassable, until the whole breadth has been broken and needs repair—a need that has to be supplied from a fund perhaps ample to keep a track of eighteen or twenty feet in good condition, but when expended from year to year over a width of forty feet is insufficient even under the best of management.

Fig. 2 shows a sketch of a street on which a little improvement has been made by defining a line for the street shades and keeping the side

VILLAGE ROADWAYS—NO. 1.

line of the roadway true and straight; but this also has its roadway bed on a level with the abutting property, and no drainage beyond the natural course or lay of the land. The street trees are in the middle of the sidewalk, a practice not specially objectionable when sufficient breadth is retained for a good walk on each side; but if the breadth is narrowed, say to eight or nine feet, then the trees are quite in the way. Placing the trees in line and defining the roadway gives an additional improved character over that of Fig. 1; but the whole being upon a level, the sidewalk is always more or less subject to standing pools of water, and the roadway being left forty

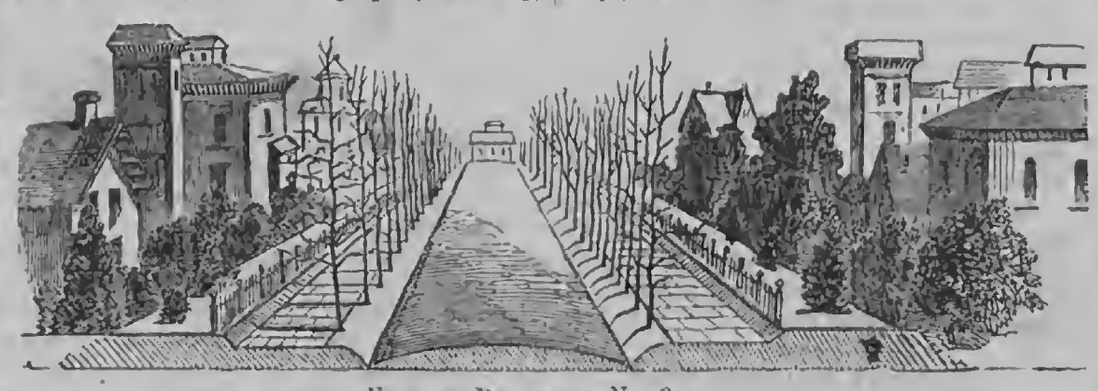


VILLAGE ROADWAYS—NO. 2.

or more feet in width is rarely in condition to be driven upon in a true or direct line.

Having shown these two roads as they are found all around the country and in the suburbs of cities, the first figure, 1, being the primitive and the second an improvement, I now propose, in Figure 3, to show how additional improvement may be made with comparatively little extra expense in first constructing, and far less yearly cost of future keeping.

In this sketch the road-bed is supposed to be twenty-six feet wide—abundantly wide for three carriages to pass each other—it is sunken two feet below the grade of the property abutting,



VILLAGE ROADWAYS—NO. 3.

and is eighteen inches below the sidewalk. It is plain to all that a dry road can just as easily be secured two feet below the surrounding level as on that level, provided the proper lines of drainage be secured. It also plain that with the road-bed and drainage at this grade, surface draining of the abutting property would be easy. To any person who has ever looked at a road so made, it needs not a word to convince him of the greater character and elevated condition this dropping of the roadway proper gives to the land and residences on the line. The roadway being once constructed and rounded in its bed toward the center, as shown in the sketch, will require far less expense in keeping or repairs, from year to year, because all surface water is at once carried off, so that it never has a chance to become soft.

Let me, however, say one word here about making the road, supposing it to be made from the natural soil. Once the grade is obtained, then the whole bed should be plowed, commencing at the center and turning furrow after furrow thereto. No firm and even settled road-bed can ever be made by hauling loose dirt on an unmoved base.

The trees in this sketch are one foot back from the front or road-bed line of the sidewalk, are designed to be fifty feet apart, and if planters of street trees would select elms for the low ground lines, maples for the next rise of grade, whitewoods or chestnuts for the highest and dryest lines, the harmony of natural association would be measurably retained, and perhaps indicate to the improver of the lots adjoining somewhat of the class of trees and shrubs best suited to the location.

I should be glad if other readers of and contributors to the RURAL would take up this subject of improving our country and city suburban roadways, because I think the advanced condition of our country and the educated taste of a large number of our people require it. In the earlier days any passway was acceptable, but when the value of lands on a line of road is estimated from one thousand dollars an acre to a high rate per foot, it seems important that something more than hap-hazard, thoughtless roadway making should be instituted. There is much more to be said, and after others have said something I will again write a word.

Pomological.

AMERICAN APPLES IN ENGLAND.

THE Editor of the London (Eng.) Garden acknowledges the receipt of a collection of apples from Messrs. ELLWANGER & BARRY of Rochester, N. Y. We omit the descriptions of varieties well known here, but the comments of the Editor, comparing American varieties with those grown on English soil, are decidedly interesting. He says:

Several of them are varieties well known in this country, but the majority and the best are strangers to us. In size these Apples do not surpass what one may see among fairly well-grown fruit here; in color they are much higher than ours, several of the kinds being a deep purplish-red; in flavor, the really essential point, they are very remarkable, and far beyond our own fruit. At the present season in London, after Cox's Orange Pippin, the Ribston, and now and then the Cornish Gilliflower, we have no Apples that can compare with the high and delicate flavor of the best of those sent to us; whether this is owing to a sunnier and dryer climate or to any inherent peculiarity in the fruit itself being much influenced by the season, situation, &c., it is likely that a sunnier and dryier climate must have an effect on flavor. The present season, which has been an unusually wet one, has had a considerable effect in altering the keeping qualities of British Apples—the Ribston Pippin for example, which often keeps good until Christmas, is now, at the end of November quite done; but the Ribston Pippins received from Rochester are firm, juicy, and delicious. It is not, therefore, unlikely that, in attempting to cultivate some of the fine varieties hereinafter mentioned, we in England, might find a fading off in flavor. On the other hand, our own varieties, such as the Ribston, seem to improve under the conditions to which they are subjected in the New World. Some of the Apples sent belong to the division which American growers term "sweet," and are the first samples we have tasted of these. In America, large numbers of Apples have been raised, and are in cultivation, in which the sugar so greatly preponderates over the acidulous principle of the fruit that the flavor of some varieties seems to an English palate to be that of a new fruit. Apples are classified broadly into summer, fall, and winter kinds; and, in each section, there are Apples termed sweet and sour.

The above Apples came packed in a barrel, in the way in which American Apples are sent to our markets, without spot or injury of any kind. Messrs. Ellwanger & Barry also sent us a collection of American-grown Pears. These, as regards size and appearance, are not, as a rule, up to the level of good European fruit. The Lawrence seemed the most interesting fruit, a large, golden-yellow kind with a richly-flavored, melting flesh. It is described as the most valuable of all the American early winter Pears, and the specimens sent were such as would compare well with the finest French or English fruit. A batch of Josephine de Malines were of very fine quality, and Winter Nelis, of average size, were even richer and higher in flavor than with us. Jones's Seedling, a very small Pennsylvania variety, is distinct and of a rich flavor. The Pears were packed in a box, and did not travel nearly so well as the Apples. This, however, could not be expected.

Field Crops.

DISPOSING OF SURPLUS STRAW.

A WRITER in the Maine Farmer is wrestling with the question, what to do with his surplus straw. It has puzzled many farmers where large amounts of grain are grown. He says:

"I have three or four tons of oat and barley straw, and the straw of fifty bushels of wheat, save what has been used for bedding, the stock thus far this winter. What shall I do with it? Will it pay to feed it? If so, to what?

"The above are simple questions for a farmer of thirty years' experience to ask, and yet I ask them in all candor and sincerity. I have asked myself the same many times and got different answers, partly because the queries are put under various circumstances, and partly, perhaps, because I have sometimes taken a more extensive or rather extended view of the matter. There are exceptions to all rules. For instance: when winter closed in upon us in 1871—the winter following the terrible scourge of grasshoppers—and we found ourselves with the least stock we thought we could get on with, and not half hay enough for what we had, it paid us to feed meadow hay and straw. So in answer to my first question I got "feed it with meal and roots."

"This year there is more hay than stock, and the only consideration is one of economy; so the questions return again. My cows are eating all the good, early cut hay they want; three quarts each of sugar beets at night, and one quart of barley meal and two of shorts in the morning; are driven to water in the cellar twice a day, and immediately tied up in a warm barn bedded with straw and left to furnish butter stock, and we are making now, Jan. 1st, five lbs. per cow, that se ls readily for 40c. a pound, and the cows are to come in in March. Will it pay to feed straw to them? I have a nice yoke of fat oxen that are doing my work, and it will take them through this week to finish it. The days will be longer then, the steers gaunted up a little, and with the warmer days and decreasing appetite, taking into account the objective point in rearing oxen, viz.: the beef they will make, will it pay to give them any more straw than they want to lie upon! Then there are the young cattle—why everybody, almost, says they will do well enough on straw. Well, let us see: The steers are designed to make at least ten hundred of beef each, and to do that with good economy will it pay to turn them from the barn in the spring no better than they came to it in the fall, if indeed as good? Then the heifers are with calf, and are to make dairy or stock cows, or both, and in the time when they ought to be growing, and the extra draught on the system at this particular time, will a diet of good, sweet, early cut hay be any too good; or if a little something in addition is given will it not pay just as well and even better, if in addition to the hay, than if with straw, where the virtue of the roots or grain is expended in getting the straw through the animal? Then there are the sheep, that pay a better profit than any other stock upon the farm, and drop their lambs in March; surely, they cannot eat the straw; so I think I shall continue for this winter, at least, to put the straw under and not inside the cattle."

Maine is a state where hay is usually abundant and of fine quality. Western farmers cannot, or at least do not rely so much on hay as winter food for stock, and cut corn stalks, and in some cases straw with corn meal profitably take its place. After all, we suspect that the meal supplies most of the nutriment, and the straw eaten is of little value. All that can be worked up into manure as bedding, and to retain liquid and solid excrement which would otherwise be wasted, is profitably used. The surplus, after doing this, may be profitably sold, and more concentrated and valuable fertilizers purchased in its stead. In some localities a load of straw will sell for enough to buy ten loads of stable manure, or a quarter of a ton of superphosphate. In other places, stock may be bought on the farm, fattened through winter, and the straw used as bedding. This will require the purchase of additional grain or oil meal as feed, and the profits will be found mainly in the manure pile.

COST OF WHEAT IN MINNESOTA.

EDS. RURAL NEW-YORKER:—It may be interesting to many readers of your valuable paper to know about how much it costs to raise wheat in Minnesota, where as yet we pay but little attention to manuring or summer fallowing.

During the past season I kept an account of my expenses, so I am able to tell, very nearly at least, what it cost me; and if I succeed in making the facts clear and comprehensive, they will not only render valuable information to your Eastern readers, but also cause many Western farmers to think more upon the subject, and, in thinking, become more or less encouraged as the facts agree with their estimates.

I wish to describe my crop on different fields, though not divided with fences, because there is great variation, and will commence with

Wheat Field No. 1, containing 10 acres.

Plowing the 10 acres, $1.25 per acre	$12 50
Seed, 13⅓ bushels White Hamburgh, at 80c.	10 64
One and a quarter days drilling, man and team, $2.50 per day	3 12
Half day dragging, $2.50 per day	1 25
One day reaping, $1 per acre	10 00
Six days binding and shocking, $3 per day	18 00
Stacking	8 00
Threshing	14 75
Use of land, $2.50 per acre	25 00
Board for the help	7 00
Total cost	$110 26

Upon this field I raised 175 bushels, making the cost per bushel 63 cents.

Wheat Field No. 2, containing 18 acres.

(This was Timothy meadow land, broken up in August and sowed the following April.)

Breaking, $2 per acre	$36 00
Seed, 20 bushels Fife, at 80c.	16 00
Two days drilling at $2.50 per day	5 00
One and a quarter days dragging at $2.50 per day	3.12
Cutting with Marsh Harvester	18 00
Two and a quarter days' binding—two men at $3 per day each	13 50
Two and a quarter days shocking—one man at $3 per day	6 75
Stacking	10 50
Threshing, 5c. per bushel	22 50
Threshing labor per day, $1.50	10 50
Board for help	18 00
Use of land, $2.50 per acre	45 00
Total cost	$206 87

Upon this field I raised 450 bushels, making the cost per bushel 46 cents. Rather favorable to the use of Harvester in lieu of Reaper.

Wheat Field No. 3, containing 35 acres.

Plowing, $1.25 per acre	43 75
Seed, 51 bushels Tea Wheat at 80c. per bushel	40 80
Three and a quarter days with broadcast seeder	8 12
Two and a quarter days dragging	5 63
Two days cutting with harvester	17 00
Two days binding, with two men at $3 per day	12 00
Two days shocking, with one man at $3 per day	6 00
Two days reaping	19 00
Eight days binding at $3 per day	24 00
Two and a half days shocking at $3 per day	7 50
Stacking	20 00
Threshing, 5c. per bushel	31 50
Two days with seven men at $1.50 per day	21 00
Use of land	87 50
Board for help	25 20
Total cost	$369 00

Upon this field I raised 630 bushels, making the cost per bushel 57 cents.

Wheat Field No. 4, containing 63 acres.

Plowing, $1.25 per acre	$78 75
Seed, 95 bushels Fife at 90c. per bushel	85 50
Six days drilling at $2.50 per day	15 00
Three days dragging at $2.50 per day	7 50
Harvesting	144 00
Stacking	48 00
Threshing, 5c. per bushel	60 00
Threshing, three days' labor, with seven men at $1.50 per day	31 50
Use of land at $2.50 per acre	157 50
Board for help	48 00
Total cost	$675 75

Upon this field I raised 1,200 bushels, making the cost per bushel 56 cents, and the *average* cost per bushel of my crop of wheat was 55½ cents. Our home market to-day is only 80 cents.

Yours truly, F. L. MEACHUM.

Plainview, Minn., Jan. 10, 1876.

PROFITS OF HOP GROWING.

IN your comments upon my article encouraging Hop culture, you appear to think me generous in urging farmers to become competitors with me in the hop market. I would inform your readers that your correspondent had no selfish motive to conceal what I claim to be the most profitable farm crop now cultivated in this country. I have also no fears of the business being so quickly overdone. No prudent business man should be discouraged by one year's low prices. If such a theory was to be followed, farmers might abandon nearly all kinds of crops on account of low prices. Of course, we cannot expect that light-brained men would be successful in any branch of business. And under discouragements they would be driven to and fro, like the rolling stone that never gathers moss.

This world is large, and a few hundred acres of hops are as but a drop in the bucket. Allow me to give a little experience upon that point. I remember well when my father first started Hop culture, all the most sympathetic neighbors advised him to abandon such a foolish idea, for the reason that hops were such a profitable crop that every farmer would rush into the business and would at once spoil it.

I can look back to the day when there was not one farmer in a thousand who knew what a hop-yard was, and few hops cultivated were sold at from 5c. to 10c. for a pound, showing that as the number of acres increased prices advanced. To prove this, I would quote the Agricultural Report of 1864, Page 97, as given by LEWIS BOLLMAN of the Department of Agriculture, in which he says: "The entire crop of hops produced in the United States has been as follows: In 1840, 1,238,502 pounds; 1850, 3,497,029; 1860, 11,010,012; and as estimated in 1862, 16,000,000."

Notwithstanding this rapid increase, prices have increased in like ratio. I do not wish to be understood to advise farmers to plant their whole farms to hops, but to cultivate a few acres in connection with other crops. F. E. B.

POTATOES PLANTED DEEP.

THE English "Cultivator" tried the experiment on several alternate rows of potatoes about 30 rods long, of planting a part about 2 or 3 inches deep, and another part 5 inches deep. The latter produced from 20 to 25 per cent. more potatoes than those that were planted shallow, the treatment in every other respect being the same. They were cultivated on the flat system which always gives more than when ridged.—C.

DEEP planting may be preferable on sandy soils, or in a very dry season on other lands; but the practice is not to be commended without qualification. We know some farmers who tried deep planting and shallow side by side for two years, and abandoned deep planting because the crop was not so good. In a very wet season, as last summer was in many localities, potatoes cultivated in ridges or hills are less liable to rot than if grown altogether on the surface, and without raising the soil about the plants. There are no positive rules about potato growing, which admit no exceptions. Some varieties will grow entirely out of the ground and be sunburned, if the earth is not drawn around them as the tubers begin to form. The Early Rose and Peerless are liable to this objection.

ORCHARD GRASS.

I HAVE had some five or six years' experience with orchard grass, and I look upon it as one of the best pasture grasses, if not the very best, in this region at least. It is as tenacious as, and much more abundant in yield than the blue grass. As a hay crop I don't as yet, think much of it, but my experience in this respect has been small. It would probably pay pretty well as a hay crop for home consumption, if cut when the bloom first begins to show, and then again in the middle or latter part of September. The stems are too coarse and hard if left to mature the seed. Always sow in the spring, about the time of sowing oats, and always plow as for any spring crop and harrow in thoroughly. It is just as necessary that it should be thoroughly covered with soil. I always sow thirty-five pounds per acre when sown alone, twenty to twenty-five pounds when sowing with clover.—W. S. G., *in World.*

Farm Economy.

TESTING FERTILIZERS.

THERE are many reasons why it is better for the farmer, gardener, nurseryman or fruit-grower to purchase *prepared* fertilizers rather than the crude materials of which they are made. He cannot have the machinery or other requisites for properly reducing, compounding and pulverizing, even though he possess the necessary knowledge and skill. One factory properly located with respect to supplies and transportation, having strong steel mills for grinding, driven by steam, with ample room for storage, and with a manager who combines long experience in the business, with a perfect knowledge of the chemical composition of plants, soils and all materials used in making fertilizers,—one such factory can manufacture fertilizers for a thousand farmers at less than one-half the cost at which they could do it for themselves. The value of a manure depends both on its elementary composition and the availability of its fertilizing elements for the use of growing plants. Crude fertilizers contain a large percentage of matter worthless in a manurial point of view. A ton of ordinary barnyard manure contains, according to Prof. GOESSMANN, the best authority in the country, as given in the Scientific Farmer, 1,500 lbs. of water, 400 lbs. of other organic matter, 60 to 80 lbs. of worthless ash, and only 20 to 40 lbs. of plant food.

Moreover, much of even this small amount is not available to the growing plant until it is thoroughly rotten and mixed with the soil. This may require a year or more. And yet these few pounds of slowly dissolving plant food make barnyard manure a fertilizer of such value that the farmer can afford to pay a high price for it, and haul it a long distance. Now, the manufacturer of fertilizers, guided by the analytical chemist, can prepare, of cheap materials, a fertilizer almost free from water, 100 lbs. of which will contain all the manurial elements found in a ton of ordinary barnyard manure in such a state of solubility that the plant will begin to feed upon it as soon as it has roots to absorb it, and so pulverized that every spear of grass or grain shall receive its share of food. And this fertilizer may be made of waste products, and when made in large quantities, at so small expense of manufacture, that from five to ten dollars' worth will serve to fertilize an acre, hauling and spreading included.

I have before me the analysis, made by reliable chemists, of several deservedly popular fertilizers. I have, also, the reports of field experiments made with these fertilizers by managers of experiment stations, agricultural college professors and farmers, all of which corroborate my statement. For example, the Buffalo ammoniated bone superphosphate contains, according to the analysis of Prof. G. A. LIEBIG, in 100 lbs., over 18 lbs. of available plant food, and less than 13 lbs. of water. The farmer, then, has, in well-made concentrated commercial fertilizers, the means of speedily rendering every acre of his land productive, however limited his supply of barnyard manure; and he can do this at so small an outlay that he may safely borrow money for the purchase, assured that the increase of crop will pay cost, interest and good profit.

But how shall the farmer know that the maker has put up a good article, or that the dealer has not adulterated it, or that it is just what his own soil needs? These are important questions which the farmer should decide, and which, happily, he may readily decide for himself without the aid of chemical analysis. An example will show my method of testing the fertilizers I use. Several weeks before planting time I procured a small quantity of Buffalo superphosphate. I filled two 8-inch pots (boxes would answer) with soil from a field which I intended for oats. With the soil in one pot I mixed an ounce of the fertilizer. I planted eight plump oat kernels in each pot, and then set them in a warm window and kept the earth moist. When the plants were about three inches high I pulled up the smallest, leaving the best four plants in each. Before the time for sowing my oats I measured the plants accurately, and found those in the fertilized soil to average 15 inches in hight, the others 10 inches, each dimension of the former being fully 1½ times that of the latter, making the bulk or weight 3⅜ times as great. From this experiment I inferred that it would be a good investment to use the fertilizer, and the result justified the inference. For every dollar's worth of fertilizer used I got, in increased yield, $3 worth of oats at 40 cents a bushel, and a corresponding increase in straw.

Farmers, you may be sure of this, that concentrated fertilizers can be made at a price which you can afford to pay, and that you have, at your own command, the test for determining the value to yourself of the fertilizers offered you. During the summer season these test experiments may be made in the open air. Let all be done with care, with accurate weights and measures, and the most important results will follow.

C. H. DANN.

SPENT HOPS AS MANURE.

ED. OF RURAL:—Will you inform me through the columns of the RURAL what is the value of spent hops from a brewery as a fertilizer, taking stable manure at $7 per cord for a basis. Expense of carting, &c., being equal.—SUBSCRIBER, *Manlors, R. I., Jan. 8th*, 1876.

SPENT hops contain considerable fertilizing matter, and, when partially rotted, it is in form for immediate use, making it much more valuable than analysis would show. Spent hops are very light, and, of course, in equal bulk with stable manure, would weigh much less. They decompose rapidly, and serve an excellent purpose in ameliorating heavy and hard soils. Market gardeners, whose land is too costly to allow them to grow clover for plowing under, use refuse hops to keep their land in condition. They find that where the soil is manured, more or less every year, an occasional alternation with spent hops gives better results than using all stable manure. We judge, however, that where farmers keep their land light by use of clover the hops could well be dispensed with, and, in such circumstances, their value per load or ton would be much less than it is to market gardeners. The quantity of spent hops obtainable is comparatively limited, and gardeners can, and generally do, pay more than ordinary farming will afford. Decaying vegetable matter of any kind is of less importance to the farmer than to the gardener, for the farmer can secure abundance of carbonaceous matter much more cheaply than in the form of refuse hops. The farmer's chief need is mineral and nitrogenous fertilizers. With these he can grow clover, and depend on that for all additional fertility needed.

Though market gardeners use spent hops largely, it is very seldom that they are applied as general manure. The more frequent plan is to use the spent hops in heating hot-beds, as they render the soil loose and pliable, and, after being thoroughly decomposed, spent hops themselves are excellent material for beds in which to sow seeds or grow small plants.

EARTH CLOSETS.

THE best one is a simple commode, or box, the proper hight, with a hole in it and a lid on hinges to cover it. A common wooden bucket is placed underneath, or any kind of receptacle, filled with common road-dust, perfectly dry, may be used. The apparatus may be kept and used in any bed-room. All that is necessary, after using, is to throw a little dry dust into the bucket and shut down the lid.

For very old or infirm people, invalids or delicate women and children this arrangement is not only a convenience, but a comfort, if not a necessity. The contents of the bucket make a very rich manure, as is well understood by the Chinese and Japanese who are far ahead of us on these matters.—*Exchange.*

Dairy Husbandry.

AMERICAN DAIRYMEN'S CONVENTION.

ROME, N. Y., Jan. 13, 1876.

THE Convention of the American Dairymen's Association, which has closed its three days' session in this city, has not been so interesting as the conventions previously held under the auspices of this Society. The sessions were held in Sink's Opera House, which affordefl ample room for a much larger audience than was in attendance.

On the first day there were few persons present, and the papers read, for the most part, went over ground which had been pretty well occupied at other conventions. Mr. SHELDON of Lewis gave an interesting address on "Hints from Experience in Cheese-Making." Mr. J. G. CANOE of Chautauqua followed in a paper on "Whole-Milk Cheese-Making," and SETH BONFOY of Herkimer read a short paper on "English Cheese-Making and Personal Experience." These papers elicited considerable discussion, but nothing particularly new was brought out.

In the evening LEANDER WETHERELL of Boston gave a very valuable and elaborate address on "Dairy Stock," which was received with great favor by the Convention. It was replete with practical suggestions, and we shall, in a future article, refer to some of the points taken.

On Wednesday there was a very good attendance, but hardly so large as at some previous meetings. Messrs. READEN of Pennsylvania and HARDING of Kentucky occupied most of the morning session by elaborate and excellent papers on "Butter-Making," in which their own experiments were detailed.

In the afternoon Mr. S. D. PADDOCK of Malone, N. Y., gave an account of the manner in which butter-making is conducted in Franklin Co., N. Y. E. W. STEWART followed with a well-considered paper on "An Experimental Dairy Station." Mr. SMITH of Philadelphia closed the afternoon session by an interesting address on the Centennial.

At the evening session Messrs. PETERS of New York and REALE of Philadelphia discussed at some length the "Commercial Aspects of the Dairy." These papers elicited a very lengthy discussion, and much valuable information was brought out.

The leading paper on Thursday was by ROBERT MCADAM of Madison Co., "On the Difference Between English and American Cheese-Making," in which some of the leading defects in the latter were pointed out. The main part of the sessions on Thursday was taken up in miscellaneous matters, the reports of committees and a general finishing up of topics which had been put over for discussion. Two of the leading speakers who had been expected—Prof. CHASSY of Amherst and Prof. CALDWELL of Cornell University—failed to be in attendance, much to the regret of the Convention.

We can only give at this time a brief outline of the work done at the Convention, but in a subsequent paper we hope to present our readers with a full report of the leading points in the papers and discussions which were of interest and value. Rome is a very convenient point for holding a Convention. The hotel accommodations are good and it is easy to be reached from the great dairy counties—St. Lawrence, Jefferson, Franklin, &c. On the whole the Convention may be regarded as a success, though not quite up to any of the previous meetings of the Association.

The display of dairy products was of the most meager description. The following is a list of dairy apparatus, &c., on exhibition;

SIBBALS' Butter Packages and Champion Butter Worker, Weigher and Salt Crusher Combined were exhibited by A. J. DIBBLE, Franklin, N. Y. The Blanchard Churn was shown by WHITMAN & BURRELL of Little Falls, who also had on exhibition a Patent Improved Curd Knife, samples of Bandages, &c., &c. STERLING & BINGHAM, Watertown, N. Y., case of Steam Dairy Filtering. The Bullard Oscilating Churn, exhibited by JOHN T. ELLSWORTH, Business Manager, Barre, Mass, MEEKS & BROWNE, Syracuse, N. Y., General Agents for this State, gave away hundreds of bottles of Golden Extract of Annatto. W. W. MOORE, Erieville, N. Y., model of MOORE'S European Milk Pan. HUBBELL & CHEESBRO, Geddes, N. Y., a Stone Jar, with Patent Wooden Cover, for butter, fruit, &c. ALVAN MIDDAUGH, Friendship, N. Y., Milk Tester. FRASIER & BENTON, Rome, N. Y., Patent Curd Mill. BIGELOW & LINSLEY'S Patent Combiner, Curd Separator and Salting Machine. EMBRIE'S Rotary Butter Worker was exhibited by SPEAKMAN, MILLS & Co., Westchester, Pa.

RECORD OF MILLER'S MEAL FED COWS FOR 1875.

OUR readers will remember an account in these columns of some remarkable experiments made by LINUS W. MILLER of Stockton, N. Y., in regard to wintering cows upon an exclusive meal diet. A letter from Mr. MILLER to us on Nov. 1st, gives additional matter in regard to these experiments.

In order to have sufficient evidence that when cows are fed upon an exclusive meal diet, the meal goes directly to the fourth stomach, Mr. MILLER fattened a beef by feeding exclusively upon meal. On slaughtering the animal, Mr. MILLER says, "quite an accumulation of meal was found in the manure, and this settled the point as to the passage of the meal directly to the fourth stomach, not, of course, in all cases, but only in those fed exclusively on meal." He refers, also, to the rapidity with which animals, fed exclusively on meal, may be made to take on flesh, as instanced in his own experience in feeding two old cows last spring that were got in good condition for beef in the short space of three weeks. The butter product of his herd, wintered on an exclusive meal diet, averaged, last spring: 1½ pounds each per cow daily, and this, he says, was nearly twice as much as he ever had his herd make upon the same rations when they were wintered upon hay. In speaking of the results from his herd, during the past season, he says, My milk has been sent to the factory 145 days, and I find the daily average of my herd to have been, for that period, 27 pounds each, or seven pounds more than last season, and 11 pounds, daily, more than the previous year when wintered on hay."

These facts, he thinks, are remarkable, and indicate to him "new wonders" in meal feeding. He says they may possibly be, in part, accidental, yet other herds of cows in this town, wintered on hay, failed to do as well this season as last, owing to its having been very wet in that locality, and that his herd should have done so much better when others, differently wintered, have done worse, is certainly significant.

When we were at the Jamestown Fair, Chautauqua Co., this fall, we made inquiry concerning the conditions of Mr. MILLER'S cows as to health and flesh, and we were assured, by parties who had been to Mr. MILLER'S place and examined the stock, from time to time, that it was looking well and doing well, comparing favorably, in appearance, with the best in that neighborhood.

As Mr. MILLER has experimented in an unusual direction with his herds, it must be of interest to dairymen to keep informed concerning the results of these experiments, and we have no doubt many will be surprised to learn that the stock has made so good a record.

THE CHAUTAUQUA CO. EXPERIMENT IN BUTTER MAKING.

WE have a letter from Mr. L. S. HARDIN of Louisville, Ky., in which he denies some of the statements made by L. B. ARNOLD in the Buffalo Live Stock Journal of Nov., concerning the competition trial in setting milk for butter making with MARTIN BAILY of Chautauqua County. Mr. HARDIN says: "That trial was not with my box (refrigerator) as ARNOLD states, but in a barrel of water with ice, after the Swedish system. ARNOLD thinks the rapid cooling "set" the animal odor in the milk. The fact is, it was the foulest smelling milk I ever handled, and I called BLODGET'S attention to it at the time. I also was able to tell which was my butter by the comparative absence of odor in it, when the samples were put together so I should not know them apart. I have written to Mr. BLODGET for his evidence to sustain me in this point. I am sorry Mr. BAILEY did not keep the butter he made in the experiment with me. It is at least natural to think he would have kept it, if he had considered it was as good or better butter than mine,"

We have given in a previous number of the RURAL a cut of Mr. HARDIN'S apparatus, together with a description of what he claims is an improvement on the Swedish system, viz.: Instead of cooling milk with ice water, as in the Swedish plan, he cools air with ice and then sets the deep cans in air—on the refrigerator plan. The refrigerator is what he calls "a double cube box," with the space filled with sawdust. This is lined with zinc. In this cooling cupboard he places his cans of milk. The cupboard has a chamber for ice. By placing the ice above the milk he claims it is kept at a steadier and more even temperature than if cooled from the bottom or sides. His cans are covered up, so that the dripping ice-water may not fall into the cream. The ice-water is allowed to accumulate at the bottom, so that the cans stand in four inches of water and no more.

We presume the reason for adopting the Swedish plan in the BAILY contest was, because this refrigerator apparatus had not been forwarded to Chautauqua County, and that one could not be conveniently fitted up for the occasion. The Advertiser and Union, in refering to the test between HARDIN and BAILY, says: "The milk set by Mr. HARDIN gave a little more butter than the shallow set milk on Mr. BAILY'S plan, and BAILY is the man who makes from 250 to 270 lbs. of butter per cow a year. So it is quite fair to conclude that the HARDIN plan took the cream and butter out of the milk pretty thoroughly. The milk was from Mr. BAILY'S cows—mostly natives."

We infer, from Mr. HARDIN'S letter to us, that perhaps better results might have been obtained in the BAILY test, if the refrigerator box had been used in the experiment. As these experiments of Mr. HARDIN with his competitors now stand, the deep setting is ahead of shallow setting, both as to quantity and quality; but, should the advocates of shallow setting reduce the temperature of their milk by the use of ice-water, the results may possibly turn out differently for that side.

COOKING FOOD FOR STOCK.

MR. V. S. BEEKMAN of Ulster Co., N. Y., evidently has a poor opinion of cooking food for cows. He details, in the New York Tribune, some of his experience in this line. He had seen in several Agricultural papers, and in a pamphlet edited by one who had an ax to grind, that there were large profits arising from cooking food for cows. From these statements it appeared that there was a saving from cooking of one-third of the feed, and he concluded that if by cooking $900 worth of food he could make it go as far as $1,200 uncooked he could afford to pay $65 for a steamer and "go in." Well, he tried the cooking business one winter and got enough of it. The labor, he says, is increased ten fold. In cold weather only a little can be fed at a time, as stock do not like it cold. He thinks not one out of ten, who advocate cooking, do their own work, and, for his part, he had rather spend his spare time in winter in reading and recreation than in the barn saving a few dollars coddling his stock.

There are a good many others who have tried cooking that have abandoned it, and feel, we fear, someting like Mr. BEEKMAN in regard to it.

The Herdsman.

STOCK IN WINTER.

A WRITER in the National Live Stock Journal remarks:—Whatever our differences of opinion in regard to the advantages of close and nearly air-tight quarters for stock, there is among intelligent and practical men, no dispute as to the great economy of providing proper shelter from storms. As lumber is now very cheap, this may be done at very trifling expense by using pine boards for roofing, and by setting posts in the ground and boarding up the sides. Very comfortable stables and sheep-houses may be constructed of plank. It would seem as if this cheap and convenient shelter was within the reach of all, as the expense would be saved in feed this winter. There is, we think, very little economy in allowing cattle to run loose in open sheds. We waste too much room. If cattle are kept indoors they should be tied up. We use double stalls, about seven feet wide, with manger large enough to feed shock corn, hay, etc., (say two feet high and twenty inches wide), and tie with chains.

Some of our Short-Horn breeders, we observe, have low mangers—low enough for cattle to get their feet into them. This is following English practice, which, where the cattle were confined in stanchions, or tied, with a large ring to slide up and down on a round pole or iron rod, may have been proper. But where a chain is used with three branches, one of which (say twenty-two inches long) is attached to the manger, there is no excuse for these low English structures for feeding. An earth floor answers for cows, with a flat piece of timber at the rear set in the earth, behind which there should be a depression for the droppings. For bulls there should be a plank floor, or stone or brick pavement.

Having provided proper shelter, we should feed with a view to keeping up the condition of our stock through the winter. The practice which often prevails of allowing cattle that are in high condition in the fall to lose from one to three hundred pounds during the winter, is not only the loss of this quantity of beef, *but of all the food consumed during the winter*, besides the great disadvantage of starting on grass in the spring with a thin and unthrifty lot of cattle. In our opinion, this is the principal reason for the impression that breeding and raising steers is unprofitable.

All young stock, colts, calves and lambs, should have meal or grain the first winter, for this is the time to lay the foundation for future excellence and profit. For calves and lambs there is no feed that pays better than shorts and bran,—we mean the old-fashioned shorts, or middling,—with this we may profitably mix shelled corn for calves, and oats for lambs. For colts nothing can take the place of oats.

We wish to impress upon the inexperienced breeder the great importance of keeping up the best possible condition in the young stock during the first winter; here is where poor keep never fails to prove disastrous, and where the more liberal expenditure for nutritious food makes the most profitable returns. It is also most important that suitable shelter should be provided for stock at this age. There is the same necessity for nutritious food and proper shelter for cows in milk, and it is as cruel as it is unprofitable to allow these useful and most profitable animals to run out, exposed to the storms of winter, with poor or scanty supply of food. The young stock over one year old, with the dry cows, will do very well out of doors with the shelter of a wood lot to run to, and where corn is cheap this may be the most economical way of wintering such stock.

We suppose that in many of the corn-growing States there is this year a good deal of corn that is not perfectly matured, and this may be profitably disposed of by feeding it in the fodder to our cattle. And in this connection, we call attention to the fact that it is generally more economical to feed cattle some grain, than to undertake to keep them exclusively on hay. One pound of meal is estimated as equal to four pounds of hay. If, therefore, we have, say fifty bushels of corn per acre, we have for the weight of the grain 2,800 pounds,—equal to five and a half tons of hay! Whether this estimate be correct or not, we think every practical man will agree that an acre of corn, with the fodder cut at the proper time, is of a good deal more value as a feed for cattle than two acres of hay. It is therefore evident that the prevailing notion that corn cannot profitably be fed to stock-cattle is erroneous.

As to hogs, it is to be assumed that good farmers will only winter over a few sows for breeding, with, perhaps, some fall pigs—the latter should be pushed for the spring markets, and comfortable quarters provided for all. We should aim to have our pigs farrowed not later than April so as to be ready for market in the fall.

HOW TO FEED CALVES.

EDWARD HIBB of Jefferson, Vt., an intelligent Englishman, writes as follows of the methods adopted in feeding and raising calves, both in England and this country:

In England, calves, as a general thing, are all raised, and a good price paid for them as soon as dropped, providing they are good calves and from good cows. Farmers who raise or buy these calves, generally adopt the following mode of feeding. For the first week new milk twice per day, the next sweet skimmed boiled milk, providing they have milk to spare, as a great many farmers who live remote from cities keep no more cows than they want to supply themselves with milk and butter for home consumption. If they make more butter than they use, the lady of the house gets that for pin money along with the eggs, poultry, &c., and with the privilege some of them draw heavily upon the "old man." The milk is often used while sweet for the servant men, night and morning, for breakfast and supper; when this is the case they make a linseed porridge or gruel for the calves, and this, with good hay, raises some splendid calves. If they raise one for veal, they generally feed new milk twice, sometimes three times a day, for eight weeks, and the last three or four days that calf is bled every day before being killed, and the veal is beautifully white and tender.

Since I have come to America I raise my calves as follows:—first week, new milk; second week, half new and half sweet skimmed milk; and gradually work on to sour or lobbered milk, and continue this all summer. If I want to veal one, I feed as above. To those I raise I give all the hay or oat straw. To give them too much early cut hay, will sometimes cause them to scour. It is preposterous for any one to try to make fashionable English veal on sour milk. It is true, calves can be made fat upon sour milk, with oatmeal or other good feed. I have had them so myself, and for store cattle I can say that I have some as good looking grade Jerseys, Devons, Durhams and natives, raised on sour milk, as the next man, and I occasionally kill one in the fall and it is nice meat. I do not call it *veal*—it is neither veal nor beef and yet I claim that it is far superior to the red-looking veal or cow beef that I have seen killed here. A moneyed gentleman who wishes to raise calves for agricultural fairs, or wishes for something extra nice, will let them suck the cow, and give them the best of chances; but such a mode would not do for the generality of farmers in the old country, and I think I may truly say, neither in this,

Where calves are intended to be kept for cows they should never be fattened when young. A thrifty growing condition is needed, and for this oatmeal porridge with skim milk is as good a food as is possible. Where young calves are fattened, the tendency to fatten is easily established and cows thus reared will always be better for beef than for milk.

SOILING FATTENING CATTLE.

AT a meeting of the South Deerfield (Mass.) Farmers' Club, President C. SMITH related several experiments which he had tried to ascertain the comparative profit between fattening young stock in the barn in summer and fattening in a hill pasture, the result of which was a large preponderance of evidence in favor of soiling, from the amount of manure saved and the healthy, thrifty growth of the animals; heifer calves, kept at home till two years old, instead of running in a large pasture, will be worth at least $10 more for a cow.

The Centennial.

THE SONG OF 1876.

[A FESTIVAL Poem, written by BAYARD TAYLOR for the German Centennial Singers' Union of New York.]

WAKEN voice of the Land's Devotion!
Spirit of freedom, awaken all!
Ring, ye shores, to the Song of Ocean,
Rivers, answer, and mountains call!
The golden day has come;
Let every tongue be dumb,
That sounded its malice or murmured its fears;
She hath won her story;
She wears her glory;
We crown her the Land of a Hundred Years!

Out of darkness and toil and danger
Into the light of Victory's day,
Help to the weak, and home to the stranger,
Freedom to all, she hath held her way.
Now Europe's orphans rest
Upon her mother's breast;
The voices of Nations are heard in the cheers
That shall cast upon her
New love and honor,
And crown her the Queen of a Hundred Years!

North and South, we are met as brothers;
East and West, we are wedded as one!
Right of each shall secure our mother's;
Child of each is her faithful son!
We give Thee heart and hand,
Our glorious native Land,
For battle has tried thee and time endears;
We will write thy story,
And keep thy glory
As pure as of old for a Thousand Years.

CENTENNIAL NOTES.

QUEEN VICTORIA has decided to send twenty pictures of the Royal collection to the American Centennial.

THE New Haven (Conn.) Board of Education have voted to have the New Haven schools represented at the Centennial exhibition.

A STEAMER which lately arrived at San Francisco from Yokohama brought the materials for a Japanese temple and the men to put it up in the Centennial grounds.

AN additional horticultural building is to be erected to accommodate the applicants for space in which to exhibit flowers, plants etc. One foreign exhibitor alone wants a tent 150 by 50 feet.

THE Centennial trial of mowing and reaping machines will require fifty acres of grass and standing grain, and the Agricultural Bureau of the Commission has put the land in the best possible condition.

ON and after February visitors will not be admitted to the Centennial grounds without a pass. Lately the crowd of visitors has been so great that the workmen have been very much retarded and interfered with.

THE first and probably the only public rehearsal of the Centennial musical association of Philadelphia will be given at Horticultural Hall in that city on the 27th inst., when, in addition to the grand chorus of 600 voices, a number of distinguished soloists will appear.

THE Winter of 1776 was an unusually mild one, and this winter therefore seems to be a repetition of its weather. An hundred years ago this mild weather was very fortunate, as it enabled Americans to procure supplies from the West Indies and prepare for the coming conflict.

CARL SCHURZ says, in speaking of the Centennial:—"The country will in the coming year resound with eulogy of the men who founded the Republic, but those old patriots, if they could, would tell us to spend fewer efforts in praising them and make stronger efforts to follow their example."

As the space set apart in the exhibition building for the American book trade has been found to be inadequate, it has been proposed to double the space for books by erecting an ornamental structure of iron, forming a second floor over the entire space, reached by staircases on either side. A willingness has been expressed by the leading publishers to share the expense of $5,000 for this structure.

THE shoe and leather exhibition building in the Centennial grounds will be a great addition to the "side shows" of the Exhibition. It will be 160 feet by 314 on the ground, two stories in hight, constructed of iron, wood and glass, and will cost $30,000. In this department of industry we can beat the world. Our exports of leather already are valued by the millions and rapidly growing. "There's nothing like leather."

HON. HENRY S. RANDALL, of Cortland, N. Y., (author of "Life of Jefferson," "Practical Shepherd," &c., &c.,) has received an invitation from the Philadelphia Centennial Committee on the Restoration of Independence Hall to meet at that place, on the 2d day of July, 1876, a limited number of authors, each of whom is requested to bring a biographical sketch of some individual whose memory was associated with Independence Hall during the early days of the Republic, or a paper on some other allotted topic. These are to be deposited among the archives of the National Museum. Mr. RANDALL is requested to furnish a sketch of the life of Thomas Jefferson.

AFTER Italy signified her willingness to contribute to the Exhibition, it was announced that a company of gentlemen intended to charter a special steamer to visit this country. Information has been received at the Centennial Headquarters that the project is an assured success, and the gentlemen are known as the Associazione Cristoforo Colombo. A very handsome and commodious steamer has been selected, and already the demand for berths has been so great that all the space has been taken and propositions are making for another. The vessel will sail from Genoa, Italy, on the 1st of June, arriving in New York on the 15th, where it will stay until the 30th, when it will leave for Philadelphia.

Insurance Department.

INSURANCE NOTES AND NEWS.

More Penalties.—Nearly all the States have enacted laws taxing insurance companies either a per centage of the premium receipts or a round sum for the privilige of doing business with their citizens. Some of them require special deposits of from twenty to one hundred thousand dollars, and there are few which do not, in some way or other, derive considerable income from them. Besides these there are no end of observances and compliances required of them, ostensibly for the better protection of the insured, but too often serving no other purpose than to augment the revenues of certain officials. Recently the Governor of Kentucky, a State that has a new insurance department to provide for, recommended the passage of a law imposing a heavy penalty upon all companies that delay the payment of claims more than sixty days after proofs of loss have been submitted. Any company failing to comply with this law will be required to pay one-fifth more than the face of the claim, as a bonus to the claimnant. This is a fair sample of the blundering way in which laws regulating insurance are framed. The intention is perhaps a good one, that is, to compel promptness of payment when payment is due, but the effect may be to encourage incendiarism and fraud, by imposing upon the companies a heavy penalty in all cases in which they unsuccessfully contest a fraudulent claim. Such legislation is not only useless, but burdensome upon an already heavily-weighted business. The companies early contest claims. The life companies pay, on an average, ninety-eight per cent., and the fire companies a still larger per cent., simply because in most instances, it is cheaper to pay than to refuse.

Mr. Chapman Resigns. The Hon. ORLAW W. CHAPMAN, for several years Superintendent of the Insurance Department of this State, has recently tendered his resignation to the Governor, and proposes to vacate, on the 31st of this month, the office he has so long and worthily filled. Judging from his official conduct, the manner in which he has endeavored to acquit himself of his not always very pleasant duties, and the efforts he has so persistently made to render the machinery of Insurance supervision more effective for good to the policy holder, we are constrained to believe that the office he vacates was never filled by a better man or one who has striven harder to do his whole duty in the premises. He came into office at the beginning of a tempestuous season for life insurance, to find himself officially responsible for the control of the companies, but with inadequate powers to do what was required of him. When he sought to bring about a better order of affairs he found himself opposed by the very influences to which he owed his appointment and his tenure of office. This has led him to retire. We hope to be able to compliment his as yet unnamed successor as highly. Whoever he may be he will find his hands full, and hampered with the same disabilities that have rendered office-holding any thing but a bed of roses to Mr. CHAPMAN.

Amalgamation and Reinsurance.—In the case of MEADE versus the St. Louis Mutual Life Ins. Co., the Court decided that this company in reinsuring all its risks with, and turning over its assets to, another company, acted without warrant of law. That in giving up its business the company placed itself in a position in which it could not carry out and complete the contract with MEADE, a thing which it had no right to do, and that the company must repay to the plaintiff all the premiums with legal interest since the day of payment. The effect of this decision has been claimed to be, to declare all the cases of reinsurance, without the consent of policy-holders, illegal, and some experts in these matters believe that any person, whose policy has been turned over to another company, may, by suing the company that issued it, recover all the payments that have been made upon it. The matter will probably be carried to a higher court for confirmation.

Look Before You Leap.—The Husbandman urges all Patrons to become members of the Patron's Aid Society, an enterprise intended to insure the lives of its members by a voluntary contribution of one dollar to the heirs of such members as die prematurely. The Husbandman claims that it, the Society, is fully established during the six months of its existence, though it incidentally admits that the fidelity of the members has not been tested by an assessment, no one having died meanwhile. This is the crucial test; all depends upon promptness and fidelity. If this is wanting the experiment is a failure. All similar enterprises, in which there was nothing to be forfeited, but always the amount of an assessment to be saved by failing to pay, have been unsuccessful. We hope this may prove an exception to an almost universal end.

The Statement of the Travelers Life and Accident Ins. Co., which appears in another column, is, as usual, a record to be proud of. Notwithstanding the hard times, this company has increased its new business, its income, its assets, its surplus and every other item that promotes solidity and prosperity, as if it knew no such word as fail and was bound to fatten upon lean percentage. This sort of thing is getting to be monotonous. If the Travelers would falter just a little, show some signs of growing shaky, be a little tardy in getting out its annual balance sheet, show a falling off of business, or something else to start gossip or create an appetizing sensation, as so many companies do and have done, we should have something spicy to write about. But it will not gratify this prurient taste, and persists in compelling us to record, year after year, its continuous and persistent growth and progress. How it manages to thrive, and wax great on premiums about two-thirds as large as those which did not suffice to keep so many companies from ruin is their secret. We do not know it, and if we did we could do no end of good by telling it.

Floricultural.

A HARDY SACRED BEAN.

MR. E. D. STURTEVANT of London, England, furnishes The Garden, of that city, the following

interesting account of this curious bean, derived from personal observation during a recent visit to the United States:

THIS plant is very rare in the northern portion of the United States, and having a desire to see it in bloom, I one day last August took a journey of 60 miles to the only locality where it is to be found in New Jersey. About 30 miles south of the city of Camden, opposite Philadelphia, which is latitude 40 deg., N., I found it in full flower, and it was a sight which I shall never forget, for I could almost imagine myself transported to the tropics. It grew in a beautiful lake, several acres in extent, one corner of which was filled with this plant. Some of the leaves rest upon the water like the Nymphæas, and these seemed to be the largest. I gathered one which measured 20 inches in diameter, and left many that were nearly as large. Others stood 2 feet above the water, as did all the flowers. Imagine hundreds of immense Tulips, in all stages of expansion—buds, half blown flowers, as large as a quart bowl, the petals being 5 inches in length—and you will have some idea of the appearance of this plant. The buds especially, were beautiful. The color of the flowers is a sulphur-yellow inside and on the outside it is nearly the same, shaded with rich green. The curious pistil, resembling an inverted cone, is surrounded with stamens of a rich orange color. The scent is like that of the Water Lily, but much more powerful. Then there were the seed-vessels, in all stages of growth, looking like roses of watering-pots supported by slender sticks.

Both leaves and flowers grew so thickly that it was with difficulty we could push our boat among them. They grew all the way from the shore to where the water was 4 feet deep. The large pointed tubers were imbedded in an exceedingly stiff sandy clay; over this lay several inches of soft mud, in which creep the long stems which start from the tubers, and from the joints of these stems the flowers and leaves grow. I pulled up some leaf-stalks and flower-stalks which measured fully six feet in length. In this locality the thermometer often stands at 80 deg. to 85 deg. in the shade in summer, and sometimes reaches 96 deg., falling occasionally in winter to zero; last winter, indeed, it fell to at least 10 deg. below that point, and ice was formed 12 inches thick. This plant could doubtless be grown in England without heat, but I suggest that one corner of the lake, fronting the palm house, at Kew, be walled off for it, the wall reaching just below the surface of the water. The portion enclosed should be heated in the same manner as the tanks under glass, and I think this would guarantee the flowering of the plant, the foliage of which, however, independently of the bloom, would be highly ornamental in any pond or lake.

Arboricultural.

HAZELNUTS OR FILBERTS.

SEVERAL of our cotemporaries of late have been calling the attention of their readers to the fact that neither the European species, or varieties of the filbert, nor those of our own country are cultivated to any considerable extent, and they naturally ask "Why this neglect of so valuable a nut?" The Prairie Farmer of Dec. 25, in referring to an article in the Register of Rural Affairs for 1876, makes the following pertinent remark:—"It is a curious fact that this paper, emanating from one of the most intelligent sources of horticultural information, can do no more than give English experience. American experience of any extent seems to be wanting."

We are not surprised at the remarks of our Western cotemporary, for the dearth of information given in the article referred to would naturally lead the reader to suppose that nothing was known of filbert culture in America, which is far from being the fact. We have ourselves experimented more or less with the foreign species and varieties during the past twenty years, and we know of other parties who have spent money and time freely in the same direction but uniformly the results have been unsatisfactory.

The late FRANCIS BUTLER of Brooklyn, N. Y. a gentleman widely known as one of our most eminent dog fanciers, experimented quite extensively with filberts. Our first visit to him, some fifteen years since, happened at a time when his filbert trees were in fine health and had reached a size to show a fine crop of nuts. There were dozens of trees eight to ten feet high, with stems three to four inches in diameter at the base, and well supplied with strong, healthy branches. Mr. BUTLER, fearing that the cold winds of winter might injure some of the choicest varieties, had protected the plantation by erecting a high board fence on the north side, and this had no doubt been a great service to the young plants. Although Mr. BUTLER, at the time named was quite enthusiastic over his success, and urged others to plant as he done, believing that the culture of these nuts might be extended as it had been in Europe, yet from previous experience and observations we had doubts upon this point. Upon a subsequent visit to Mr. BUTLER'S plantation we found his trees were being attacked by a fungoid disease somewhat similar in its results to the pear blight, although evidently quite distinct from it in character. A single branch, or in some instances the entire stem and branches, would suddenly die, and upon examination a fine, whitish mycelium could be detected covering the entire surface of the wood underneath the bark, occasionally penetrating to the very center of the stem. In a few weeks from the time the bark showed signs of oozing, sporidia emanating from the mycelium underneath would burst through and appear distributed over the surface in the form of small, whitish mushrooms, from the size of the head of a pin up to that of a small pea.

Mr. BUTLER'S plantation, which was doubtless the best ever seen in this country, was destroyed by this disease, and the same results have attended all of our own experiments in attempting to cultivate the foreign species of filberts. We obtained plants from Mr. BUTLER'S plantation before the disease appeared in it, and have also procured imported plants direct, but all have met the same fate in the end. We have tried planting upon various kinds of soils, from a stiff clay to a light sand—in shady situations as well as in the open field, but in every instance the experiment ended in failure. But the most provoking phase about this filbert culture is, that the plants will usually grow very rapidly, look vigorous and healthy until they begin to bear, and then, without a warning sign, disease will demolish our finest specimens; but even after the entire top is killed the roots frequently throw up such fine, vigorous suckers that one is inclined to give them a chance, but only to see them go the same way a half dozen years later.

For the last three quarters of a century at least, our nurserymen have been importing plants of the various varieties of European filberts, but we are not aware of a healthy, bearing plantation at the present time anywhere in this country. But we need not dispair of filbert culture, for we have two distinct native species and many untured varieties which will succeed under cultivation, and from these we may raise new sorts, probably equal to the best known abroad. Experiments in this direction are now in order.

Around the Republic.

"DOWN SOUTH."

Diary and Notes of an Ex-Editor Seeking Health.

BY CHARLES D. BRAGDON.

Jacksonville, Fla., Dec. 15.—There be thermometers and thermometers! But what liars they are!—or those who report their record! One boarding-house keeper whom I have met reported his thermometer "stolen by a nigger," and he showed me the very spot it was stolen from. Where from, do you think? From a nail beside the front door on the piazza. This front door is on the *south* side of the house! The sun shines down upon the white piazza floor until it is so hot that the oil has oozed out and the paint peeled off.

I said, "That is a queer place to keep a thermometer. Why did you keep it there?"

"Oh, you see, the boarders wanted to know how hot it was here last winter, so they could write home to their friends up there in that cold country, and so I thought I would put the thermometer where it would be hot enough for 'em."

Since that I've placed less faith in thermometrical reports here in Florida. But I know Jack Frost and its effects when I see them; and there has been a curling up of orange leaves in certain situations; the Bananas have succumbed, and their broad, glossy, green, upright leaves are now drooping, brown and withered; the Castor Bean plants, which some of the residents of this city affect, have lost their semi-tropical beauty—if that is a proper prefix to their style. But the Oleanders are unharmed; and I do not know but this is quite as intelligible a statement of the degree of cold we have had as anything I can give based on thermometrical records, which are variously given as 28, 32 and 34 degrees—the lowest marking of these vexatious instruments.

I heard a lady say that she found ice in her water-pitcher one of these cold mornings. That same day I was talking of the climate with a gentleman who deals in real estate, and he rather promptly said, "Well, it is pretty safe to say that that lady lied—or at least was greatly mistaken; for my thermometer only marked 34 degrees, and it was in as cool a place as can be found in Florida!"

There you have it! Thermometers again! Nevertheless, *there was ice in the water-pitcher!*

SOLON predicted this cold weather during the fog, and said he dreaded it a great deal more than the fog. Evaporation is so rapid that the air is chilled and sharp and penetrating, and seems to "double a man up" a great deal quicker than a greater degree of cold would North. But the air is pure and good, and the sun warm, and it is better than the fogs, though they have doubtless saved the orange crop.

Dec. 16.—Bless their dear, good hearts! Here come letters from RURAL readers wondering

4259

"why I stay in such a damp, foggy hole as Jacksonville"—"why not go to St. Augustine or Palatka?" or——&c., &c. Don't they know that the only difference between the fogs of St. Augustine and Jacksonville at this time of year is, that one *can* cut a Jacksonville fog with a knife, if it is a sharp one, and cannot a St. Augustine fog? As for the other places, there has been a fog dance all over the State, so far as I have been able to ascertain. Again, this is as good a place as any to "sit down and growl" when a man feels like it.

Dec. 20.—Since my last entry here we've been raising delightful days. I've found a thermometer that is kept in the shade, and the range at midday has been 65 to 80 deg., but generally 75 to 80 deg. This with a breeze that renders it comfortable in the shade at any time of day. In the North I had great faith in the sun, I delighted in "basking in the sunshine." I don't bask here! I've tried to, and find it not so agreeable. The sun becomes quickly altogether too intimately acquainted with one's head and goes for a fellow's bump of metaphysics, without judge or jury. Really, I think the sun may be a worse "blessing" than the fog!—for the fog is

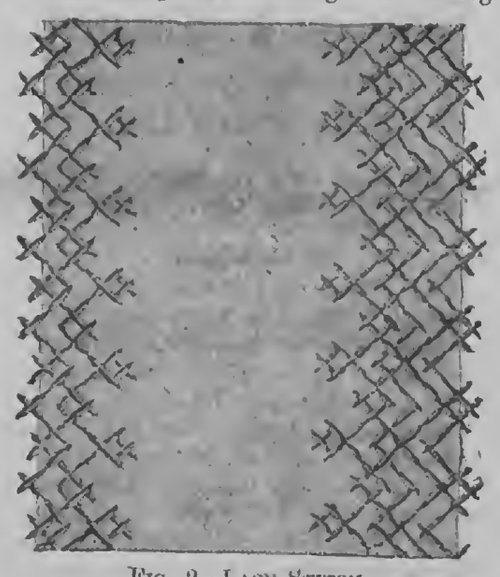


FIG. 2—LACE STITCH.

certainly a "blessing." One can walk before 10 o'clock very comfortably in the sun without an umbrella over his head—such days as we've been having; but from then until 4 P. M. one needs shelter. Such is my experience, and yet I have often endured a far greater degree of heat in the North with less discomfort. It seems to be the *quality of the sunshine* rather than the intensity of the heat that makes the difference. It can't be filtered through the same kind of medium here as North. Talking with old residents and some Northerners who have spent summers here, they call it "Delightful; but you must keep out of the sun." Of this, however, I *hope* to talk from experiences hereafter.

Christmas Day, 1875.—It is more like a Fourth of July here, in its seeming, than Christmas. The deep green foliage, the hot, sunny day and the powder exploding in one form or another make the day seem as unseasonable as it would to celebrate Christmas July 4th. The colored brethren are especially devout and jolly to-day. Their devotions began last night, and when I awoke at 5:30 o'clock this morning, I could hear their songs of praise and their hallelujahs from yonder church. All the night through had the hearts beneath their dusky skins celebrated the birth of the Christ-child.

Dec. 27.—"Will oranges ever be a drug in the market here?" asked two or three gentlemen who have orange plantations of their own—two of them Northern men and one a Georgian. Two said "Yes" and one said "No." The two who said "yes" based their opinions upon no other facts than that "everybody is planting oranges and the thing is to be overdone." The other—a gentleman from the North, who has had a few years' experience in orange culture, and who is not without horticultural experience at the North—said it would be a great many years ere the orange market here would be glutted, for oranges can be grown and sold at a profit for a much less price than any one gets now. But he added that, although a vast area of land may be planted with oranges, it does not follow that a very large per cent. of the trees planted will ever become productive. The orange in its earlier years requires much care until it is fully established. Observation leads him to believe that the proportion of cultivators who will succeed in orange culture is about equal to those who have made dwarf pear culture profitable in the North. One of the other gentlemen finally consented to this last opinion, indorsing the statement that, while "many might be called, few are chosen" orange culturists. All consented to my proposition, that there is more money made at present by starting orange plantations on new and cheap lands and selling out to Northerners who have more money than wisdom than in growing the fruit for market.

Dec. 30.—Two men from Michigan who have been through the State with a view to investing in homes, if they liked it, told me that they should start home to-day satisfied that no well to-do Michigan farmer, unless his or his family's health required a milder climate, could improve his condition by coming hither and entering into any agricultural pursuit. An Indiana family went home a day or two since with the same conviction. They had been in the State some months. I am simply reporting isolated facts, let it be remembered. There are probably a great many of an entirely opposite character. Three men from bleak Nantucket have just gone back "sick at heart"—which means homesick, I reckon. They had traveled up the Indian River and thereabouts, and up the St. Johns, and did not conclude to stay the winter through, though they were prepared to do so if they thought best. A Minnesotan said he had spent a "heap" in travel in the State, and "couldn't see it." He has gone back.

It is too soon for me to express an opinion

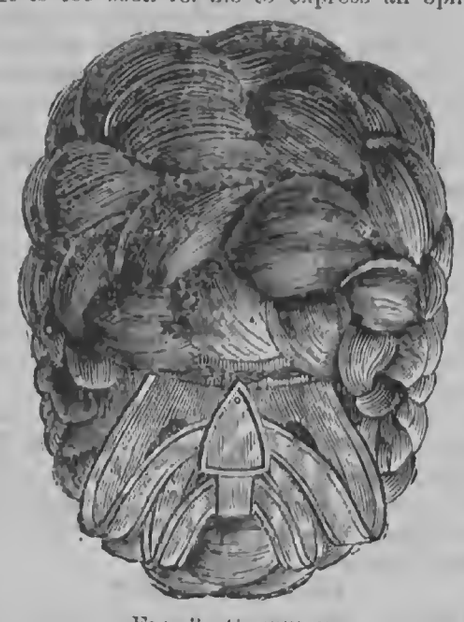

FIG. 3—COIFFURE.

which is gradually forming as to the policy of leaving a good home in the North for any that can be made here. But let those who think of making the change first come and look before selling out there. Of course, if the question of health is the main one, that is a different matter. Even then I would not advise the disposal of Northern property until after a residence here of a few months. Things anticipated and things realized are so different! Even the things realized impress different people differently, depending upon the imagination—the romantic nature of the person. You know some people call everything "lovely"—even a New York fog! or a northeast New England wind. I don't want such creatures to determine the degree of heat or cold *I* can endure; nor can they expect me to accept their standard of loveliness. Yet, I find there are some most romantic writers who are just now describing Florida,

Modes and Manners.

FANCY WORK.

Fig. 1 gives a pretty design in braiding, which may be used on pique, cloth or silk, as the ornamentation required be for tidy, mat, cushion or ottoman.

Fig. 2 is a design in "lace stitch," which, when done in embroidery silk or floss in bright colors, forms a unique and Oriental effect. A jacket with a band of black velvet put around it, upon which this style of embroidery in color is applied, (the overlapping stitches are supposed to overlap on the jacket material), is extremely effective. If the material and velvet be blue, gold-colored thread produces a fine effect. White or black is also good. Two or three harmonious but striking colors used together are also recommended. This stitch is also pretty for ornamenting blue flannel.

COIFFURE.

Fig. 3 illustrates the every-day style of fashionable back hair dressing with comb, which has again come into universal use. Those in real tortoise shell are the most beautiful, but are so expensive that most ladies are obliged to make choice of those in imitation. Metal combs, in silver, and others with high gilt tops, or ornamented in enamel or precious stones, are also fashionable. The much frizzing of hair, having left not a few fashionables with front head bald, has brought into very general use demi-wigs, or false fronts, sometimes called "scratches." They are frequently worn even by young ladies who admire the *furore* for luxuriant front hair, and the low, Greek brows these new wigs produce. They are so cleverly made and worn as to almost defy detection.

GENTLEMAN'S UNDERSHIRT.

Fig. 4259 is a desirable model for a flannel undershirt. The front being double, forms a complete protection for the lungs against cold. The garment is very easily made, there being but one

4251 4251

seam in the sleeves, which are sewed in without fullness. The pattern is in ten sizes. Price 25 cents.

CHILD'S DRESS.

In reply to requests from some lady readers of this department for illustrations of children's dresses, we give back and front views of two costumes—4251, suitable for in-door, and 4258 for out-door wear. They are suitable for boys or girls, and can be made up in any material from pique to cloth. The pattern for each is of six sizes, for children from one to seven years of age. Price of pattern 25 cents. MINTWOOD.

NEW TRIMMINGS.

BUTTRICK'S Delineator says:—On asking for "something new in trimmings," the reply was, "Nothing new—no call for anything but braids, braids, braids." Of course the answer was exaggerated, but it conveyed the idea intended, that upon every garment where braid could be put, braid was used; that being the latest caprice in decorations, later even than fur, which was introduced a season or two ago but has never been so popular as at present. Braid trimming is seen either alone or in connection with fur,

4258 4258

being equally stylish one way as the other. The assortment of fur trimming is this season far more extensive than it has ever been before, prices ranging from fifty cents to fifty dollars or sixty dollars per yard. Aside from these, no new trimmings are offered.

Entomological.

ENTOMOLOGY AND ITS RELATIONS TO HORTICULTURE.

A Paper Read Before the Annual Meeting of the New Jersey Horticultural Society held at New Brunswick, Jan. 20, 1875.

BY ANDREW S. FULLER.

EVERY thoughtful man must regret that there should exist in this, our Centennial year, a necessity for presenting a paper to any Horticultural Society upon the subject which I have selected. But there are thousands of otherwise very intelligent men among us who are not aware of the intimate relationship existing between entomology and horticultural pursuits. All insects to them, are "bugs," and enemies of the human race, either directly or indirectly, and, in their opinion, no good can come of a close study of their history or the true economic position which they hold in the great indivisible chain of nature.

As evils generally are only the manifest results of a disturbance of some natural law, we may conclude that the depredations of insects to any considerable extent are the legitimate fruits of our own ignorance of their habits, or indifference to the application of proper preventives.

Of course, insects are just as necessary to the existence of plants as the plants are to insects, and the total annihilation of one would result in the same fate to the other; consequently, we do not seek such extreme measures, but aim at establishing and retaining an equilibrium between the two. We might perhaps, without loss, dispense with the codling moth, plum curculio, and Colorado potato beetle, and some few more of the most abundant noxious species; but even should this ever become possible, it would not be wise to place the execution of so great a work in the hands of ignorant laborers. I do not mean by this term, "ignorant laborers," those we employ on our farms or in our gardens, but men who know nothing of the science of entomology, however well they may be informed on other subjects.

A man may be a passably intelligent horticulturist and at the same time a poor entomologist; hence, in his attempts to regulate matters among insect depredators, he may do more harm than good. For instance, the now common cabbage worm or caterpillar of the small white, rape butterfly, (*Pieris rapæ*) introduced from Europe a few years since, has spread to every part of the country where cabbages are cultivated. When first introduced it appears to have had no natural enemies except the birds, and these made little impression in checking its ravages; but after the lapse of a half-dozen years the parasite which had for ages preyed upon it in Europe arrived, and immediately commenced to lessen the number. So rapidly did this little parasite fly accomplish its mission, that the second season after its appearance in my neighborhood scarcely a specimen of the cabbage worm could be found. Previous to this time, the Agricultural and Horticultural press had not only advised the killing of all the worms found working upon the cabbages, but the gathering of the chrysalids which could usually be found in great numbers attached to fences and outbuildings during the winter. This was good advice at first, but worse than useless after the appearance of its parasitic enemy, because the pupæ of the latter are always inclosed within those of the former; therefore, in attempting to destroy an enemy, we were likely to kill many friends. Time and again I have received specimens of the cabbage butterfly chrysalids which were literally crowded full of the pupæ of the little *Pteromalus puparum* (or cabbage worm parasite) which had, in a few years, almost put an end to this great enemy of the cabbage.

From this one instance, as well as scores of others which might be named, it must be apparent to every one that a knowledge of insect life is as necessary, in order to secure desirable results, as to know something of plant life to become a successful horticulturist. In fact, it is scarcely possible for a man to reach a very advanced position in either entomology or horticulture, without becoming more or less familiar with the principles and processes of both.

The first step made by the novice in collecting specimens toward forming a cabinet, he will meet insects feeding upon plants: and this leads him to make investigations in regard to their name and habits. He soon discovers that while certain species of insects confine their ravages to certain kinds of plants, others feed indiscriminately without much apparent preference.

INDIFFERENCE OF THE MASSES.

The increase of noxious insects has spread consternation among farmers and fruit growers of the country, causing losses of untold millions of dollars to them; and while they mourn over their losses, scarcely an effort is made to prevent such disasters in the future. It is more than fifty years since THOMAS SAY described and named the Colorado beetle, and nearly twenty since its Eastern march was begun, and yet, while our entomologists sounded the tocsin, foretelling the results which must follow the spread of this pest, as well as how it might easily be prevented, no heed was taken of the warning, and to-day we are only paying the penalty of indifference and neglect. Had a tribe of Indians marched down from the Rocky Mountains and destroyed five or fifty thousand dollars' worth of property, there would have been a great hue and cry made over it; but an insect may come and destroy fifty or one hundred millions of dollars, and not one move will be made to repair the loss or prevent a repetition of the same.

I cannot attribute this general apathy of our people in such matters to anything else but universal ignorance of the science of entomology, or that our politicians cannot see any opportunity for swindling the masses in fighting insects as they do in the case of a war with a human foe. Only show our Congressmen and State Legislatures how they can make a little or good deal of money out of a war upon insect foes, and there will be no lack of men and means to conquer them.

The annual loss to the cotton planters of the Southern States through insect depredations, is from ten to one hundred millions of dollars; still, no considerable effort has ever been made to save this vast amount to the country. But the actual losses of crops cultivated is not the full extent of injury caused by our insect enemies, but they have prevented the introduction and dissemination of many valuable kinds of plants, as well as compelled the abandonment of hosts of others over extensive regions of country.

The plum, peach and apricot which formerly flourished in all parts of this State, are now only rarely cultivated, except in the gardens of our cities and villages, and all in consequence of insect enemies.

The same or similar conditions exist in many other States; and still, in the face of these facts, entomology is a science almost unknown in our common schools and colleges. Two Western States do, I believe, employ an entomologist to gather information and disseminate it among their people; but the salary obtained for this service is less than that obtained in a second-rate clerkship in our cities; which shows how lightly the labors of entomologists are appreciated—another evidence of the universal ignorance of the masses of subjects affecting their own immediate welfare.

NEW JERSEY A LAGGARD.

In the year 1785 a society was organized in the city of Philadelphia under the name of the "Philadelphia Society for Promoting Agriculture." In the published reports of this Society during the succeeding twenty-five years, I find numerous communications from gentlemen residing in New Jersey—in fact, the most active members were Jerseymen. During the period named New Jersey was the center of pomological knowledge, and such men as WILLIAM COXE of Burlington, RICHARD PETERS of Belmont, PAUL COOPER of Woodbury, and many others whose names are well known in the history of the State, were hard at work, gathering and disseminating horticultural information. But in reading their writings we learn that the plum curculio had already begun its ravages, the peach tree borer had very nearly discouraged these pioneers in the field, and vainly did they seek practical or scientific information in regard to the habits and history of these insects. The question now arises, How much better off should we be to-day in regard to the habits of these identical species, had no one investigated the subject but Jerseymen? We have institutions of learning endowed munificently, one having received over a million of dollars during the past half-dozen years; but should a pomologist visit one of our colleges to learn the name of the common apple tree borer, he would probably find their entomological knowledge or cabinet did not extend beyond a stone model of the *Scarabæus* of the ancient Egyptian. Admitting that "distance lends enchantment," would it not be well to learn something of our own immediate surroundings, as well as of people long since passed from this earth?

WHAT IS THE REMEDY?

That we can never wage a successful war against our insect enemies without knowing the principal features of their natural history, is conceded by every one who has paid any attention to the subject; therefore, the first thing to do is to devise some means for a general dissemination of entomological information.

Perhaps if this Society is sustained as I hope it may deserve to be, something of the kind may be done through its annual reports. But I have no faith in any scheme for bringing about any great change or revelation in regard to the interest of the masses in entomology—or in fact any other useful branch of science—unless the seed is planted in our common schools. These are the nurseries to which the nation must look for its future supply of "bent" or upright twigs, and the longer we overlook that fact the more remote will be the day when every child shall know that all insects are not bugs nor created expressly to torment the human race.

We must have elementary works upon entomology suited to the capacity of children, in which the life history of some of our most common insects is given in language readily understood. The history of the mosquito would be especially interesting to the children of New Jersey, and it might even attract the attention of those of larger growth, for I fear there are many men and women in the State who are not aware of the fact that this very troublesome little fly in one stage of its existence performs a most meritorious work, beneficial to beings of a higher order.

The main features in the history of all insects—such, for instance, as their various transformations—could readily be imparted to children in plain but attractive language, and thereby diffuse a knowledge of these creatures which would naturally increase, and eventually produce most beneficial results. With such a system of education, the people who will probably meet at our bi-centennial celebration, might be so well informed upon entomological subjects as not to look upon the common thousand-legged worm as a kind of caterpillar, or believe that insects breathe through their nose or mouth, or execute their songs by the aid of the same organs. Perhaps they would also know that little house flies never grow to be big ones, but are born little and remain in that condition, and that all kinds of flies come from the pupæ full size and as large as they ever will be.

There are thousands of such simple scraps of insect history which it would be well for everybody to know, if for no other purpose than to promote their own pleasure in passing through life.

IN CONCLUSION,

permit me to suggest that our future progress in horticulture largely depends upon our success in controlling insect enemies. The labors of a few men scattered here and there through the State, will accomplish very little in this direction; but by an organized effort, with a proper knowledge of the work to be done and the best method of doing it, the end sought will be reached in due course of time.

Diary of a Ruralist.

DAILY RURAL LIFE.

From the Diary of a Gentleman near New York City.

AN ODD REQUEST.

Jan. 11.—There must be some strange people in this world, if one is to judge from the letters they write. With my limited correspondence, I receive some rather amusing epistles and strange requests for assistance. Of course, I am not going to open my private letters and let everybody read them; but I am in receipt of one this week from a perfect stranger, which contains such an odd request that it is worth noting in my Diary. The writer says he is about writing a book on agriculture, in which he is going to set forth a "new principle in vegetable life," and he requests me to write a chapter in said proposed work on some important subject, adding, as an inducement, "I want to make the book important and interesting."

Now, I am not disinclined to have my name handed down to posterity in good company, or to lend a helping hand to those who aspire to the same position; but the "new principle in vegetable life" mentioned, makes me rather wary about such a venture, unless I am let into the secret in advance. Laying all levity aside, I am somewhat chagrined that a man who says he has read my Diary for years, should think me so verdant as to contribute a chapter to a proposed book of the character of which I know nothing or that of the would-be author. I must turn over a new leaf in my scribbling, or some one will be offering me a situation as baby nurse, or traveling companion to a respectable elderly lady.

MY SEED CABINET.

Jan. 12.—I have been in the habit, for many years, of preserving specimens of the various kinds of seeds which happened to come into my possession. To have them handy for examination, I put them into small vials, varying from the small glass tubes used for homœopathic pills up to those which will admit a good-sized bean. These vials cost but a trifle when purchased in quantities, and are preferable to boxes for preserving seeds requiring frequent examination.

Now, my principal object in keeping such things was first, to know them, and second, to see how often an old sort would come around as a new one. I think the Hulless oat has been offered as a newly-discovered variety something like ten times since my first acquaintance with it, forty years ago. Then there is the old Tartarian buckwheat, which has turned up from time to time as India wheat, Merino wheat, etc., etc.: but these cabinet samples I have found very convenient for aiding me to identify this old acquaintance, no matter under what kind of name it comes. Then it is handy to have samples of the different kinds of wheat, beans, peas, and such coarse kinds of seeds, for comparison, when some peddler of novelties comes along with "a wonderful" and newly-discovered variety for sale. If every farmer in the country had made a practice from his boyhood up, of saving a few specimens each of all the different kinds of seeds which he had either raised or met with on his travels, he would be far less liable to become the dupe of swindling dealers in such articles than without those aids for detecting frauds.

It is said to be hard "for old dogs to learn new tricks," therefore I have little hope of influencing old men to form such collections as I have named: but I do hope some of the boys who read this Diary will take an interest in the matter. But let me caution them, in advance, not to become too enthusiastic in the beginning, for in such matters it is best to make haste slowly, and continue unceasingly to the end of life. If you can afford nothing better for holding the seeds, make some small paper bags large enough to hold a dozen good-sized beans and long enough to allow the end to be folded under. Commence by taking a few specimens of every kind of bean you can find in the neighborhood, writing the name on the outside of the bag and the date of collection. If the variety is known by two or more names, put them all on, for it is well to know all we can learn of each variety. Also, write down whether the variety is a pole, bush, snap, field, early or late bean. All this and much more can be written in a very small space. Now, a collection of fifty to one hundred kinds of beans is not a difficult thing to obtain by a little perseverance, and if arranged in neat vials they would form an ornament worthy of a conspicuous place in any farmer's or gentleman's residence.

Some of the tropical species of peas and beans are exceedingly beautiful, being of an almost dazzlingly-brilliant color. A few years since I procured a number of varieties from Hindostan, China and Japan, among which were some that were not only beautiful in their dried state, but the growing plants were so entirely different from our ordinary kinds that one could scarcely believe them to be beans. I have picked up a good many sorts of beans, but am far from "knowing beans" yet, and these hints are thrown out with the hope that some boy who may read this will be able to come nearer that point than I have.

Collections of wheat, oats, corn, and all other kinds of seeds, should be gathered and preserved in the same manner, not forgetting the various kinds of fruit and forest tree seeds. Any one who will do this and keep it up through life, cannot fail to become well informed in regard to the products of the country; and should a farmer's son ever go into a city and engage in mercantile pursuits, or enter any of the learned professions, the knowledge thus acquired will be found of great practical use. A minister or lawyer who really "knows beans," will be able to make many a "telling point" during a professional career which could not be made without such knowledge. Individuals should not only endeavor to accumulate knowledge in this direction, but the Granges throughout the country could scarcely do better than to form cabinets of all their local productions for the benefit of members and their families. When this point is reached exchanges can be made between Granges in different parts of the Union. Let this be done, and the occupation of swindling seed peddlers would soon be gone.

SEEDLING POTATOES.

Jan. 13.—JOHN, who is my man of all work about the place, was very anxious to know how so many new varieties of potatoes were produced, and last summer I explained how the thing was done. As a result of this explanation, I began to find seedballs of potatoes hanging up here and there about the place at the time of digging the crop last fall. Two or three weeks since JOHN washed out his crop of potato seeds and spread them out on boards to dry, the same as he usually does with tomatoes; but he was so impatient to know whether the seed were good and likely to grow, that he sowed a quantity in a box in the greenhouse. The seed being sound, they came up in a few days, and now JOHN is in trouble, for he can scarcely spare the room to keep all the plants growing until spring, and I tell him if any one is destroyed it may be the very best of the whole lot—for nothing can be known of their value except by waiting until the tubers are tested.

Of course it will be hard to beat some of the new sorts of potatoes now in cultivation; still, raising seedling potatoes is no more difficult than raising tomato plants; and if the boys on the farm would practice a little more of this kind of diversion, good results might follow, and it would certainly do them no harm.

A CORRECTION.—In my Diary of last week there were several typographical errors, and one very important omission in the third paragraph of the second column, viz.:—In speaking of the figure of the *Agave Virginica* appearing in CURTIS' Botanical Magazine, it should have been followed by the words, "and one also in the *American Agriculturist*, November, 1871."

Patrons of Husbandry.

MEETING OF N. Y. STATE GRANGE.

THE third annual session of New York State Grange was held in Auburn, commencing Jan. 11th, Master G. D. HINCKLEY presiding. The annual address recommended further provisions for addresses and lectures. The Secretary and Treasurer have during the year addressed such Grange meetings as could be conveniently reached, and this did much for the progress of the Order; but they could not respond to half the demands made upon them. The Master recommended that the expenses of speakers be paid either by the State Grange or by the subordinate Granges to be benefited.

The Patrons' Aid Society, a co-operative life insurance, is prospering. Until Feb. 14th the fee of membership will be $3, without regard to age. For further particulars address J. S. VAN DUZER, Elmira.

The following officers were elected:

GEO. D. HINCKLEY, Master, Fredonia, Chautauqua Co.
M. B. Riggs, Overseer, Palmyra, Wayne Co.
Guy Shaw, Lecturer, Penn Yan, Yates Co.
Geo. Slaughter, Steward, Campbell Hall, Orange Co.
James H. Lee, Assistant Steward, Southwest Oswego, Oswego Co.
Rev. Milton Rude, Chaplain, Weedsport, Cayuga Co.
H. Bowen, Treasurer, Medina, Orleans Co.
W. A. Armstrong, Secretary, Elmira, Chemung Co.
Albert J. Potter, Gate Keeper, Orwell, Oswego Co.
Mrs. A. Snedaker, Ceres, Clyde, Wayne Co.
Mrs. S. G. Wiggins, Pomona, Antwerp, Jefferson Co.
Mrs. H. E. Evans, Flora, Brant, Erie Co.
Mrs. Sarah J. Van D. Mark, Lady Assistant Steward, Waterloo, Seneca Co.

Executive Committee—Wm. G. Wayne, Chairman, one year, Seneca Falls, Seneca Co.; John O'Donnell, two years, Jamaica, Queens Co.; L. H. Bishop, 3 years, Lorraine, Jefferson Co.

The Secretary's salary was fixed at $1,000 per annum; the Treasurer's at $100. The Master's necessary expenses only will be refunded. Addresses were made by O. R. INGERSOLL of Knickerbocker Grange, New York, and others, and it was decided to hold the next meeting of the State Grange in Rochester on the fourth Tuesday of January, 1877.

THE PATRONS IN GREAT BRITAIN.

THE P. of H. is an organization designed for the social and material advancement of farmers, irrespective not only of section, but of country. The Order has made a considerable and gratifying progress in Canada and the other British American Provinces. It has been suggested that the Grange should be introduced into Great Britain. The subject was discussed at the late meeting of the National Grange and the Master was authorized to appoint deputies to carry out this project. In accordance with his instructions he has named Mr. J. W. A. Wright of Fresno county, California, as the first deputy to inform the farmers of the world in regard to the objects of the Grange, and the great work it is doing in this country.

The Louisville Ledger of Jan. 12th, announcing this appointment, says:—The task could not have been placed in better hands. Mr. Wright is a Princeton graduate of the class of '57, and is a practical and scientific horticulturist and botanist. He has resided in California since 1868, and has been one of the most prominent leaders in the Grange movement on the Pacific slope ever since the inception of the Order. Mr. Wright was the first Master of the California State Grange, and has organized fifty-five subordinate Granges in his own State. He has been an attendant at the last three meetings of the National Grange as Past Master, and in 1874 was chosen to draft the declaration of purposes of the Order. It will thus be seen that he is thoroughly identified with the organization, and is conversant with the most minute details.

Mr. Wright will sail from New York next week, and though the length of his stay in Great Britain will depend largely upon the amount of success with which his mission will meet, he will not be absent above two months.

It is the belief of those prominent in the Grange that, by union and co-operation, the farmers of this country and of Great Britain can do much to enhance their mutual interests, and advance the dignity of labor to a great degree. When there are fifteen subordinate Granges organized in a foreign country, they will constitute an independent body, or what is known in America as a State Grange. The members of a foreign State Grange will not be compelled to render any allegiance or pay any dues to the National Grange, but they will stand upon a fraternal footing with the Patrons of this country, and will be entitled to their aid and counsel whenever requested.

Those who are interested in the farming interests of England may be divided into three classes, viz:—the land-owners, consisting of the nobility and the wealthy squires; the farmers, or those who rents the lands, and the agricultural laborers, or those who are employed by the farmers. Of these three classes the Grange will appeal more directly to the second one. The farmers of England are still suffering from the effects of unjust laws, which discriminate in favor of the owner of the land and against the tenant. These laws give the legal rights to do that which custom sanctioned in the days of feudalism. Then the nobility were all-powerful, and they asked for no law other than their own will. For years the farmers have striven against this injustice, and sought to obtain aid by appeals to Parliament, but in vain. Their efforts were "dispersed." They did not unite in a solid body, and mass their strength for the attack, but skirmished here and there, and were, as a natural consequence defeated.

Prominent among the acts of legislation which they have striven for, we may mention the "Tenant Right Law," and the "Game Law." The first is a demand for a law requiring the land-owners to compensate the tenants for costly improvments which the interests of good farming demand that they make upon the land which they have rented.

The second advocates a change in the game law. Hitherto this law has been altogether in favor of the land-owner and against the farmer. It enabled the former to preserve game upon land which he had rented, and to hunt it upon all occasions, often to the utter destruction of the crops. The absurd injustice of this will be seen at a glance, and yet the victims have not, as yet, been able to secure a law to protect themselves and their property from the calamity which may fall upon them at any time.

The effects of the establishment of the Grange in England cannot but be gratifying to Patrons and friends of the Order on both sides of the ocean, and we wish Mr. Wright the greatest success in his undertaking.

Hygienic Information.

RUSSIAN CURE FOR DRUNKENNESS.

H. HAUROWIZ says that for some time past, *Aerba serpylli* (wild thyme) has been used with great success to effect a permanent cure of drunkenness; in case of a relapse (only after years), a short treatment will effect a cure again. The treatment consists in making an infusion of wild thyme (1½ oz. to 1½ pints), and give the patient a teacupful every half hour. The next day it is given every two hours, and then four to six times a day until the cure is complete, which generally takes from two to three weeks. The effects are in the following order: vomiting, diarrhœa, increased urine, strong transpiration; then, generally, increased appetite and craving for acidulous beverages. Diet: easily digested food, and lemonade or other acidulous liquids.

INFANTILE THUMB-SUCKING.

THE British Medical Journal publishes an article by Dr. Horace Dobells, in which that distinguished physician states that he has observed that a peculiar and rather common deformity of the chest is caused by the habit of sucking the thumb in infancy and early childhood. He says that the weight of the arm on the thorax of the child, during sleep, produces depression of the ribs in the line occupied by the arm when the thumb is placed in the mouth. The doctor thinks this is a very important effect of the habit of thumb-sucking—one which has never been pointed out—and he regards it of sufficient consequence to be put on record for the benefit of other observers.

HYGIENIC NOTES.

For Keeping the Teeth White there is nothing better than fine coal ashes. Take a very fine sieve and sift what you want: throw away the coals, and what remains will be nearly as fine as flour. Now wet your brush, dip it in the ashes and use. Of course it feels very gritty to the mouth; so also does what the dentists cleanse with; but it will not cost you one dollar, which is the dentist's fee—generally half an hour's work. It leaves the teeth perfectly white and sweet. Use every week or two.—BROWNIE.

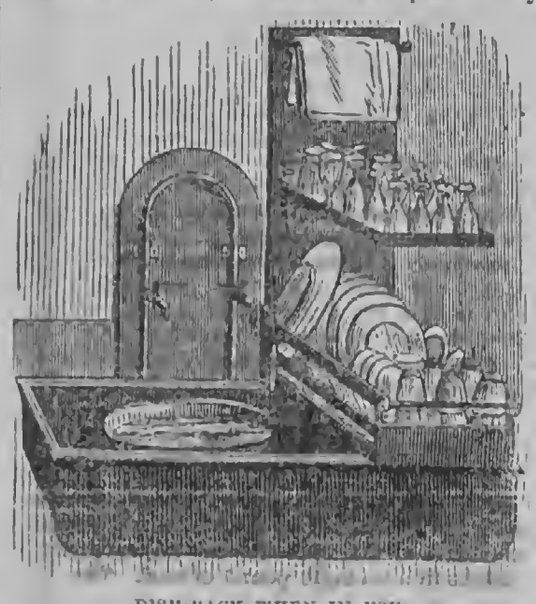
Incurable Heart Disease.—On reading the advice in RURAL of Dec. 11 in regard to the above disease, and feeling the propriety thereof, a few more injurious practices came to mind, which I have learned by experience to avoid, and which may be worthy of notice,—such as lifting (even a few pounds), going up long flights of stairs, or walking up a hill, as well as a stooping posture. The latter is particularly trying to the muscles of the heart in some forms of that disease.—A. F.

To Prepare an Egg for an Invalid.—Beat an egg until very light, add seasoning to taste, then steam until thoroughly warmed through, but not hardened; this will take about two minutes. An egg prepared in this way will not distress very sensitive stomachs.

Domestic Economy.

PATENT FOLDING DISH RACK.

THE accompanying cuts represent a valuable adjunct to the kitchen fittings in small or medium sized houses, which has been patented by



DISH-RACK WHEN IN USE.

a gentleman in Brooklyn. Its advantages are apparent at a glance, and will commend themselves to every practical housekeeper. It is always inconvenient to wash dishes in an ordinary sink, as there is not enough space for plates, dishes, glassware and other articles to stand after they have been rinsed off, and they are constantly liable to breakage or chipping. The present appliance, when not in use can be folded up and put entirely out of the way, and it is of a most convenient and compact form. Being made of black walnut, it is substantial and ornamental, while there is less risk of injury to the articles placed upon it. The lower shelf is intended for larger dishes, and the upper for cups and smaller articles, while there is a towel-rack at the top. As fast as each dish is washed it can be set aside on the rack, where it is entirely out of the way, and where it will be drained without further trouble, ready for drying. The size of the rack is about three feet by six inches, and it is adapted for almost any sized sink. A friend who has

DISH-RACK WHEN FOLDED UP.

tested one in his own home recommends this rack as being all that it is represented. The price is $4, we believe.

SELECTED RECIPES.

To Clean Old Pork Barrels.—Old pork barrels, whether tainted or sweet, should be thoroughly cleansed before being used for new pork. A very simple and effectual method is to put in a peck of strong wood ashes and a couple of pails of water, and let it stand a day or two; then scour thoroughly with a stiff corn broom. The lye will take hold of all the greasy particles with which it comes in contact, and the ashes, water and broom will, if vigorously used, leave them as sweet as new barrels. Rinse in cold water to remove all the ashes, then pour boiling water all around the sides and wash clean; now rinse again in cold water and the work is done.

To Keep Hams.—There is no better way to keep hams through the summer, free from taint or insects, than by hanging them up in the smokehouse, which is of course to be kept perfectly dark. Where there is no smokehouse or dark room, sew each ham up in a canvas bag and thoroughly whitewash it. We have also kept them perfectly by rubbing into them wood ashes, packing them in barrels and covering them with ashes.

How to Fry Chickens.—The best way to fry chickens is this:—Scald, pick and wash your chickens thoroughly in clean water; then quarter and throw them into boiling lard. If a few minutes they will be done brown; then remove them and serve them up hot and dry. Do not put them in grease again. In this way the fowl is very tender and is a great delicacy. If you don't believe it, try it, and if you do, why, try it again.

Stewed Shoulder of Mutton.—The shoulder must not be too fat. Bone it, tie it up in a cloth, and boil it for two hours and a half; then take it up, put a little cold butter over it and strew it thickly with bread crumbs, parsley, thyme, pepper and salt, all properly mixed. Let it remain in the oven half an hour, so as to brown it perfectly. Serve with lumps of currant jelly on the top, and gravy or spice round the dish.

Pisciculture.

FISH CULTURE IN THE WEST.

A WRITER in the Chicago Times from Northville Michigan says:

In no State is fish culture receiving more attention than Michigan. Aside from private enterprise, the State and the United States have aided in the work. A State hatchery under the supervision of Hon. Geo. H. Jerome, of Niles, is located at Pakagon, in which over 700,000 salmon have been hatched and distributed to the waters of the State during the last four months.

A State hatchery for white fish is also established at Detroit, in which there are now over 7,000,000 of eggs that were taken from the white fish of Detroit river, during the first week of November, and which are expected to hatch in March. In about ten days after they hatch the "umbilical sac" (from which they obtain their nourishment) will be absorbed, when they will be "planted out" in the lakes of the State that are thought to be suited to their habits.

The great success that has attended the hatching and letting loose of young shad into the Connecticut and Hudson rivers, and the consequent reduction of price at the fishing grounds, from 50 cents to a dime a piece for shad, give encouragement to promoters of this enterprise, and inspire the hope that the investment will prove a good one.

At this place, 25 miles northwest of Detroit, is the hatchery of Mr. Frank Clark. The Deputy Fish Commissioner of the United States, Mr. James W. Milner, made arrangements last fall with Mr. Clark to hatch out 800,000 salmon eggs and 4,000,000 white fish eggs. The salmon eggs were obtained from the head waters of the Sacramento river, Cal. They were out of a lot of 8,000,000 that were obtained there under the auspices of the United States Fish Commission in September last. The eggs arrived at this place on the 7th of October, and commenced hatching on the 25th, and continued up to the middle of November. When first hatched they were about an inch long, nearly transparent, and had a large appendage which prevented them from swimming, but which furnished them their nourishment during the first 40 days of their existence. At the end of this the umbilical sac was absorbed, the fish had grown to be over an inch long, and they required food. It was at this stage that they were "planted out" into streams of Ohio, Indiana, Illinois, Tennessee and Kentucky.

These rivers were selected that appeared to be the best suited to the habits of the fish. Salmon are always hatched in fresh water, where they remain till they are one to three years old. Then, when no obstacles intervene, they go to salt water where they grow very rapidly, and when of 10 pounds weight or more they return to propagate their species. It is a well established fact that, if no insurmountable obstacles prevent, they will invariably go to their native spawning beds. It may interest some in Chicago to learn that 286,000 young salmon were turned loose into the Kankakee river during the last 30 days. They were put into the head waters, near South Bend. It is thought by those who have given the subject careful examination that the California salmon (*salmo quinnat*) will thrive and be able to withstand the high temperature of the waters of our western and southern rivers.

Tests were made last summer in the San Joaquin river, a good salmon stream in California, and it was found that the temperature of the water was from 80 deg. to 85 deg. for weeks at a time, which is higher than that of the Mississippi or the Gulf of Mexico.

Mr. Jerome, in behalf of the State, is making an experiment by putting young salmon into the lakes, hoping that the fish will be content to remain in the lake and not attempt to push down to salt water over Niagara falls.

Is it not best to make these experiments? The rivers of Great Britain, many of which were nearly barren, and others in which no salmon were found, have by artificial propagation become sources of income to the government and furnished an abundance of wholesome food for the people. What has been done there may be done here, and we predict that the 8,000,000 eggs which have been distributed to various States will produce salmon suited to the streams in which they are placed, and that their progeny will furnish a rich supply of food for coming generations.

"PROGRESS AND IMPROVEMENT."

MOORE'S RURAL NEW-YORKER,

A NATIONAL ILLUSTRATED

RURAL, LITERARY AND FAMILY NEWSPAPER.

SATURDAY, JANUARY 29, 1876.

PUSH ON THE RURAL COLUMN!

DURING the first month of the Centennial Year the RURAL NEW-YORKER has made decided progress, its increase of circulation indicating the near inauguration of our candidate for President —GENERAL PROSPERITY. While we have been doing our utmost to furnish the *Most Valuable Weekly of its Class*, its Agent-Friends, both near and far, have manifested their appreciation of the paper by kindly introducing it to the favorable notice and consequent substantial support of thousands of level-headed people who were previously non-subscribers. For this generous and timely exercise of influence we tender sincere thanks, and trust our friends will continue their efforts in the same direction until everybody who ought to take the RURAL—all who would be benefited thereby—shall be supplied.

February is a short month, but recruiting officers for the Rural Brigade, if they improve their opportunities, will be enabled, during its twenty-nine days, to obtain many subscribers in their respective localities. We anticipate a goodly number of recruits during the month, and hope that not only our Agents, but high privates among our subscribers (both old and new), especially in localities where there are no recruiters (club-formers), will do their friends and us the favor to show the RURAL and solicit and forward subscriptions—remembering that we give Premiums of intrinsic value for thus doing good to individuals and community.

Don't forget, please, that, as the RURAL is electrotyped, we can furnish back numbers to all new subscribers from Jan. 1,—even if a million copies are wanted—nor that there is yet time to start new clubs and secure liberal and valuable Premiums. Therefore, *Push on the Rural Column!*

PREMIUMS FOR CORN.

MR. CONRAD WILSON makes the following offer through the Christian Union:—Believing that the present average yield of corn in this country is much lower than it ought to be, and that, consequently, the cost of production for each bushel is in the same ratio too high, and knowing, as I do, that with more thorough and well directed effort far better results may be reached, I herewith submit to the farmers of the United States the following Premiums, consisting, in part, of valuable books, and works of art of acknowleged merit, including also other articles of utility and value:

FOR THE FOUR BEST YIELDS.—1. For the largest yield of corn from one acre, an order on R. H. Allen & Co. for Farming Implements, amounting to $50. 2. For the second best yield per acre, an Oil Painting, worth $40. 3. For the third best yield per acre, an order for books, at publisher's prices, $30. 4. For the fourth best yield per acre, a Portfolio of Art Subjects, worth $20.

FOR THE FOUR LOWEST COST.—5. For the lowest cost per bush., for corn, an order on Baker & Bro. for Fertilizers, amounting to $50. 6. For the next lowest cost per bush., a Painting, worth $40. 7. For the third lowest cost per bush., an order on Bliss & Sons for seeds, $30. 8. For the fourth lowest cost per bush, a Portfolio of Art Subjects, $20. These premiums will be awarded at the close of the harvest of the present Centennial year.

How many farmers among RURAL NEW-YORKER readers will compete for these premiums? Our belief is that the largest yield per acre will also prove the lowest cost per bushel, in which case the farmer, taking first premium will get $100 in Agricultural Implements and Fertilizers.

PREMIUM POTATOES IN 1875.

MESSRS. B. K. BLISS & SONS of this city, last year offered $500 in premiums, $250 each for Eureka and Snowflake, to those growing the largest yields of potatoes from a single pound of seed. The Committee (Messrs. P. T. QUINN, J. M. HEXAMER and GEO. THURBER) has made its Report and awarded prizes as follows:—For the largest quantity of Snowflake from one pound of seed:

1st Prize to	P. C. Wood, Esther, Ill.,	1417	lbs.,	$100 00
2d " "	J. L. Perkins, Little Sioux, Iowa,	1304	"	50 00
3d " "	Fredk. H. Seiler, Verona, Essex Co., N. J.,	1125	"	40 00
4th " "	J. I. Salter, St. Cloud, Minn.,	1090½	"	30 00
5th " "	Alfred Rose, Penn Yan, N. Y.,	1080½	"	20 00
6th " "	Henry V. Rose, Penn Yan, N. Y.,	1060¼	"	10 00

For the largest quantity of Eureka from one pound of seed.

1st Prize to	J. L. Perkins, Little Sioux, Iowa,	1666¼	lbs.,	$100 00
2d " "	P. C. Wood, Esther, Ill.,	1403	"	50 00
3d " "	Alfred Rose, Penn Yan, N. Y.,	1149	"	40 00
4th " "	Milton M. Rose, Penn Yan N. Y.,	1145	"	30 00
5th " "	J. I. Salter, St. Cloud, Minn.,	1087	"	20 00
6th " "	Henry V. Rose, Penn Yan, N. Y.,	1066¾	"	10 00

The Committee says:—When two years ago your Committee awarded the first prize for the largest yield of Extra Early Vermont Potatoes from one pound of seed, to Mr. Salter of Minnesota, for the then unprecedented yield of six hundred and seven (607) pounds, many considered the climax of productiveness reached, and not a few doubted that such a quantity had ever been grown from so small a quantity of seed. Yet so much has the general interest and ambition stimulated the cultivators of the soil, both here and in Europe, that in England nearly double that amount (1082 lbs.) has been grown from one pound, and in our own country no less a yield than nearly treble that obtained then, entitles now to a first premium, and nothing less than a thousand from one can win even the lowest premium.

The planting, in nearly all cases, was done between the 10th and 26th of May, and one-fourth of all competitors dropped the seed on the 10th of May, nearly a week earlier than in former years.

A comparison of the distances between the hills, with the average yield per acre, gives a most interesting and valuable table, as follows: The sets planted at a distance of

2 x 3	feet	gave a	yield of	378	bushels	per	acre.
2 x 4	"	"	"	462	"	"	"
3 x 3	"	"	"	651	"	"	"
3 x 3½	"	"	"	441	"	"	"
3 x 4	"	"	"	379	"	"	"
3½ x 4	"	"	"	343	"	"	"
4 x 4	"	"	"	322	"	"	"
4 x 8	"	"	"	98	"	"	"

The large number of data of which the above figures form an average, give these statistics a special value. Although the greatest yields from one pound grew from hills four feet apart, the largest crops per acre were raised at distances of three feet each way, and that as the distances between the hills are increased or decreased, the yield diminishes in regular proportion. In the first case, there remains wasted ground which is not reached by the roots of the plants, and in the latter, the roots are so crowded that they can not obtain all the nourishment they are capable of consuming.

The Snowflake and Eureka have been grown alongside of some older sorts, and it has been found that "the new varieties will stand almost any amount of manuring and return a corresponding yield of tubers, while the older sorts, under the same treatment, would make nothing but vines and a few small tubers."

A MARVEL OF DRAINAGE ENGINEERING.

IT is well known that much of the most fertile land in Holland has been reclaimed from the sea by immense windmills which pumped the water out of the land while levees kept the water from further encroachments. Some of these achievements have been costly and required years for their completion, but they have generally paid. These successes have encouraged further attempts, and now we are informed that the great Zuyder Zee—an immense arm of the sea covering 500 square miles, or about half a million of acres—is to be pumped dry and reclaimed for the use of man. To do this will require the erection of a bank of earth one hundred and forty feet at the base, over which the waters of the Zee are to be pumped into the ocean. This will require a force of 9,400 horse power working incessantly, and pumping 5,000 cubic yards of water a minute, for two years and a half. It is hoped to drain the surface sea water from the land in this time after work is commenced, but a much longer time will be needed to get the soil in proper farming condition. Underdrains must be made to withdraw surface water, while open sluices will be left in some places to provide irrigation when needed. Two ship canals will admit large vessels to the new land, while smaller canals will afford easy transportation to every portion. Two trunk lines of railway are placed to cross each other at right angles, and at the intersection of these a city will probably arise on what has been for ages a desert of wild waves. Centuries ago the space covered by the Zuider Zee was an immense forest, with heavy timber, but it gradually gave way to the encroachments of the ocean.

It is expected that the work will require twenty years for completion, at a cost of one hundred millions of dollars. Similar land, reclaimed from the sea in smaller amounts, has been made worth four hundred dollars per acre, so that when completed the land will be worth two hundred millions. Of course, only in a country where interest is low can such enormous and long-continued expenses be justified. In the United States the interest account in twenty years would be more than the principal. In Holland, however, interest is usually only three per cent., and the Government is basing its calculations on that expectation.

The reclaimed sea land is very fertile, and under the skillful management of Dutch farmers and gardeners yields large crops of all kinds of vegetables. It seems especially adapted to the growing of Dahlia, Hyacinth and other bulbous-rooted flowers, while its moisture and fine tilth is the natural home of the cauliflower and cabbage, in the growing of which the Dutch excel all other peoples.

RURAL NOTES AND QUERIES.

American Dairymen's Association.—At the last annual meeting the following officers were elected for the ensuing year: Pres't—Hon. HORATIO SEYMOUR. Vice-Pres'ts—X. A. Willard of Herkimer, T. D. Bliss of Onondaga Co., O. S. Bliss of Vermont, David S. Wells of N. Y. City, M. Folsom of N. Y. City, Stephen Farrell of Wisconsin, Chas. House of Lewis Co., G. B. Weeks of Onondaga, C. E. Chadwick of Canada, Wm. Blanding of Broome, Dr. Geo. F. Cole of St. Lawrence, A. M. Fuller of Pennsylvania, L. W. Miller of Chautauqua, E. A. Ayres of Jefferson, T. F. Keller of Cattaraugus, G. E. Morrow of Illinois, C. F. Whittier of Minnesota, John T. Ellsworth of Massachusetts, Hon. William A. Johnson of Erie, Pa., Dr. L. L. Wight of Oneida, L. Straight of Ohio, Charles Hazen of Wisconsin, Prof. L. Wetherell of the Boston Cultivator, Mass., A. B. LaMott of Tompkins, Edward Norton of Connecticut, P. H. Burchard of Illinois, C. H. Wilder of Wisconsin, O. C. Blodgett of Chautauqua, D. H. Burrell of Herkimer, J. M. Peters of N. Y. City, S. A. Farrington of Canada. Sec'y—L. B. Arnold of Rochester. Treas.—Hon. Harris Lewis, Herkimer.

Black Bass in South Jersey Waters.—Capt. PEIRCE of Wenonah, the only fish culturist in South Jersey, during the latter part of the past season placed Black Bass in the following-named waters of that region:—Mullica River, Hammonton Lake, Great Egg Harbor River, Cooper's Creek, Big Timber Creek, Woodbury Creek, Mantua Creek, Wenonah Lake, Raccoon Creek, Old Man's Creek, Alloway's Creek, Salem Creek, Cohansey Creek, Malaga Lake, Maurice River and Tuckahoe River. In some of the larger of these streams stocks were placed in two different branches. Some of this work was done for the State, but most of it under the auspices of the West Jersey Game Protection Society—a chartered institution that is doing good service in stocking the streams and forests of that region with choice varieties of fruit and game, and fully protecting the same under the stringent laws of that State. Capt. P. is the Society's Agent, and has kindly promised us some items concerning the action it has taken relative to game.

Cheating in Weight.—A farmer writes to the Syracuse (N. Y.) Courier that he and his neighbors having some grain to carry to market, took the precaution to accurately weigh it before leaving home. The buyer made the loads four to six bushels less than they should be. One of the farmers had no evidence of his home weight and so could do nothing, as the grain was already mixed with that in store. The other had a witness of the weight of his grain on the home scales, and compelled the buyer to pay for the full amount. There is little doubt that such frauds are often attempted these hard times, when buyers' profits are light. Every neighborhood at least ought to have platform scales, and many farmers could much better afford to buy them than to sell their produce exclusively at buyers' weight. It is hardly necessary for us to advise readers to write to FAIRBANKS & Co., The Buffalo Scale Works, or to JONES of Binghamton, for scale price lists.

A Continuous Horticultural Show.—We have received from E. W. BUSWELL, Treas. and Librarian, the schedule of prizes to be awarded by the Mass. Hort. Society during 1876. The Exhibitions are made monthly, and in the summer months more frequently, and the prizes, amounting to $3,200, are very judiciously appropriated. The Exhibitions include one especially for Roses, another for Strawberries, one for Azaleas in April and for Pelargoniums in May. An additional appropriation of $2,100 is made for Exhibitions of Fruit, another of $1,200 for Garden Vegetables, and $300 for Gardens, Green-Houses, &c. The total amount to be paid in prizes is $6,800, and with the number of successive and almost continuous Exhibitions through the year will undoubtedly make a success unexampled in American Horticultural annals. Competition is open to all.

N. Y. State Ag. Society.—This Society held its annual meeting in Albany, Jan. 19. The Treasurer's report showed the total receipts for the year to be $41,210.90, of which $15,086.34 were from the Fair. The total disbursements were $38,068.16, leaving a balance on hand of $3,142.81. The following officers were elected:

Pres't—EDWIN THORN, Millbrook, Dutchess Co. Vice-Pres'ts.—First District, John W. Wing, New York; 2d, Isaac H. Cocks, North Hempstead; 3d, Daniel Doncaster, Albany; 4th, N. Martin Curtis, Ogdensburgh; 5th, Jas. Geddes, Fairmount; 6th, Jos. Julland, Bainbridge; 7th, R. J. Swan, Geneva; 8th, Frank B. Redfield, Batavia. Cor. Sec.—Thos. L. Harison, Morley. Rec. Sec.—Wm. H. Bogart, Aurora. Treas.—Adin Thayer, Hoosic. Ex. Com.—Wm. H. Holmes, Washington; G. T. Hoffman, Chemung; Geo. F. Mills, Montgomery; John R. Stuyvesant, Dutchess; Ely Fox, Herkimer; Heman Glass, Monroe; David M. Osborne, Cayuga; Reuben E. Roby, Steuben.

The Dairymen's Association of Ontario—Is to hold its next Annual Convention at Ingersoll, Feb. 9—10, and the Committee hope to make it both beneficial and interesting to dairymen and farmers generally. Addresses will be delivered by several eminent gentlemen, and a large attendance is anticipated. Any parties wishing to attend and become members may obtain certificates by applying at once to the Secretary, Mr. J. C. HEGLER, Ingersoll, on presentation of which to the different stations on the Grand Trunk and Great Western Railways they will be entitled, owing to special arrangements made with these companies, to tickets at one fare and a third the double journey. It is desirable that parties wishing to attend should apply to the Secretary at once for certificates, so as to avoid confusion and delay.

RURAL BREVITIES.

THE Agricultural Bureau estimates the cotton crop at 4,100,000 bales.

THE mild, wet weather this winter has spoiled much corn in the West.

KANSAS spends one million dollars a year in her schools, and the school fund is constantly increasing.

GEN. SHERMAN says there are 4,000,000 of people loafing around cities who ought to be scratching the Western prairies for an honest living.

MICHIGAN appropriated $1,000 to represent the State at the Centennial Exposition. Half of this is to be used in making a display of fruits.

THE "Southern Agricultural and Industrial Exposition" will open in New Orleans, Feb. 26, and continue ten days. J. N. MARKS is President.

THE Item in the RURAL of Dec. 18, saying that "the village of Lyons made $1,000 out of her peppermint crop this season," should no doubt read Lyons, N. Y., and $100,000.

BROTHER WISNER of Hay Rake fame displayed his smiling countenance in our Publication Office recently. He was on his way to Dayton, Ohio, where he will probably arrange for the future manufacture of his Rakes.

CONNECTICUT has established an Agricultural Experiment station with Prof. W. O. ATWATER at its head. This is a good movement and one which should be imitated by other States.

THE farmers of Wisconsin will hold a Convention at Madison, Feb. 8-11. These Conventions are held annually, and many interesting and profitable subjects are discussed. Sec'y W. W. FIELD, Madison, will furnish programme of the Convention.

PATRONS, take the RURAL to your Grange; tell the brothers and sisters, what is true, that though not an organ, it is sound on the principles of the Order, and an earnest advocate of the interests of the producing classes,—asking support only upon its merits.

THE Kansas Horticultural Society is urging the importance of State experimental stations for both Agricultural and Horticultural information. It is believed that private enterprise will co-operate to make these experiments more perfect and to lessen the expense.

THE National Live Stock Journal of Chicago has been sold by the former proprietor, Mr. GEO. W. RUST, and will hereafter be published by a Joint Stock Company. It will be edited by J. H. SANDERS, assisted by Judge T. C. JONES, GEO. W. RUST, A. M. GARLAND and CHAS. P. WILLARD.

THE HOUSEKEEPER is a neat and well edited monthly magazine devoted to domestic affairs. We know the publishers, C. F. WINGATE & Co., to be reliable, and have no doubt they will fulfill the promises made in their advertisement, headed "A Novel Idea," given elsewhere in this paper.

SOME of our correspondents suspect that "F. E. B.," who writes so enthusiastically in favor of hop growing, is a dealer in hops or a brewer, anxious for large increase in production. We assure them that this is not the fact. He is a farmer, and only urges hop growing because he regards it as the most profitable crop.

THE Eucalyptus, or fever tree, will grow from cuttings. A Californian, who set a slip a year ago, reports to the Pacific Rural Press that it is six feet high. This, however, is little, if any, larger than seedlings at that age, and Eucalyptus seed is plenty and cheap. The tree should be planted wherever the climate is suitable.

F. M. LUPTON & Co., 37 Park Row, N. Y., publishers of "Cricket on the Hearth," (as will be seen in another column,) offer a very attractive premium, consisting of a series of wood cuts in the highest style of art. These are given free to *every* subscriber to the "Cricket," and with the paper, are a combination that should appeal to the taste of all who like a good paper and a handsome present. The price of the paper is unusually low.

BUSINESS NOTICES.

BRIDE & CO,
769 Broadway, N. Y., want agents for the best money-making article in the world. Send for particulars.

Neglected Coughs and Colds.—Few are aware of the importance of checking a Cough or "Common Cold" in its first stage: that which in the beginning would yield to "BROWN'S BRONCHIAL TROCHES," if neglected, often works upon the Lungs.

THE HEROES OF THE EARTH.

BY KATE MERIDEN.

[SUGGESTED by an incident which came under the writer's observation.]

THERE are hearts that bear great burdens,
Under a cheerful smile—
There are natures high and lofty,
That sorrow all the while—
There are lives that give to duty
More than their own heart's blood,
And divest their life of beauty
For some unselfish good.

Ah, not on a field of battle
Are all Life's Heroes found—
Not in the crowded palaces
Of those of high renown;
But oft to some sad child of earth,
Is sent to prove how long
A spirit of immortal birth
Can "suffer and be strong."

When the veil is torn asunder,
And day succeeds the night,
Then these patient, holy watchers
Shall see the blessed light:
For amid the vast deceptions
The world has given birth,
They shall shine in peerless beauty,
The Heroes of the Earth.

The Story-Teller.

MAX AND MARGARET.

A STORY OF LOVE AND DUTY.

BY VIOLET FULLER.

CHAPTER I.

"WELL, MAX," said Captain HEATHCOTE to his friend MAX VON BERNSTEIN, as they drove through the pleasant lanes of the pretty village of Heathcote, one lovely August evening, "how do you like this for a specimen of our English villages?"

"Very much indeed," was the answer in excellent English, but with a slightly foreign accent, "it is exquisitely picturesque, and the fresh green of the grass is quite refreshing to the eyes after a sojourn in the dusky city of London." And in truth Heathcote was one of the prettiest villages to be found in "Merrie England," with its tiny cottages covered with roses and trailing vines, and its quaint old church, standing in the midst of its green churchyard, keeping solemn watch and ward over the many generations of sleepers in its quiet precincts.

Of the two gentlemen who were driving through the village one was the son of Squire HEATHCOTE of the Chace, the largest landed proprietor in the neighborhood, and the other a young German who was visiting Heathcote for the shooting season. As they neared the gates of the Chace, Captain HEATHCOTE took off his cap to an elderly gentleman who stood at the gate of a small but pretty garden. A neat cottage ornee rose in the back ground, whose low French windows looked out on the blooming flower beds.

"Welcome home, BERTIE," said Major TREHERNE: "come down and see us this evening."

"All right," shouted BERTIE, as he turned to direct the groom to open the gates.

"MAX," said BERTIE to his friend, "you must go with me this evening; I want to introduce you to my cousin MARGARET."

"Ah," said MAX, "the cousin of whom I have heard you speak so often? What is she like?"

"Wait till you see her. I fancy she will satisfy even your artist eye."

"So," said MAX, as he thoughtfully stroked his dark mustache; "I shall be delighted to see this paragon."

MAX, Count VON BERNSTEIN, although a Prussian, was not one of the stereotyped, fair-haired and blue-eyed Teutonic type of manhood; his mother had been a French lady, and he inherited her dark Provencal beauty.

The dog-cart was by this time whirling up the avenue, and the gentlemen soon stood on the steps of the huge pile of stone known as Heathcote Chace.

"Welcome 'ome, captain," said the old family servant, as they entered the large hall.

"Thanks, THOMAS; how are your old bones?" said the young man in a pleasant voice. "Where is my father?"

"In the study, sir."

"Come along, MAX," said BERTIE; "and THOMAS, show the servant of the Count where to go." He led the way to the study, where they found the good old Squire deep in accounts. His face brightened at the sight of his son's handsome face.

"My dear boy," he said, as he grasped his hand, "I am so glad to see you; I have been feeling lonely."

"Why, you look in good condition, sir; this is my friend, Count VON BERNSTEIN. You know his father, I think."

"Ah, yes," answered the Squire as he shook the Count warmly by the hand. "We were at college together at Bonn." He did not add that they both had loved LEONIE DE COURCELLES, the bright Provencal beauty, but that VON BERNSTEIN had been the favored suitor. "You resemble your mother," said the Squire, as he looked kindly at the young German.

"I am glad of that," said MAX; "I thought my mother perfection."

"And you have lost her?"

"Yes, she died some time since," answered MAX as he turned away.

"Come," said BERTIE, who had an aversion to scenes, "it is time to dress for dinner, I'm sure."

"Yes, we dine at six——"

"Off with you, MAX," said the hungry Captain; "I can't be kept waiting."

The young men left the room, and the Squire went to his, full of the recollections of his life at college and the dark-eyed LEONIE, who had been his first love. Squire HEATHCOTE was a fine specimen of an English country gentleman. His foreign education and extensive travel had given a refinement to his manners unusual in men of his class. His wife had been some years dead, and as BERTIE was his only child, he was anxious that he should remain at home and lead the life of a country Squire; but BERTIE had a fancy for the army, and his father did not oppose him.

The gentlemen met at dinner in renewed spirits, and conversation was brilliantly sustained during the meal.

"Are you for a walk, sir?" asked BERTIE, as they rose from the table.

"Where to?"

"I promised Major TREHERNE to go down to the cottage this evening; as there are no ladies to make tea for us here, we must go elsewhere."

The Squire laughed. "That is your own fault, BERTIE; but you can go; I will take my nap. Take care the Count does not cut you out."

"O, MAX is not a free agent; I'm not afraid. Eh, MAX?"

"I don't understand you," said the German, haughtily, who was quick to take offense.

"Never mind, old fellow," said BERTIE, good humoredly; "we can talk about it as we go along.'

"Don't stay long, my boy," said the Squire. "GOD bless them," he said as he watched them down the avenue; "they are both fine fellows"—as in truth they were, each in his different way being a noble specimen of manhood in its very flower and prime. They were of equal hight, but BERTIE'S fair curls and frank, blue eyes, were a great contrast to the dark, flashing orbs and waving black hair of the German. His tawny mustache was of regulation length, as became a Captain in the Plungers, while MAX'S was closely trimmed and as dark as his hair. Both men walked with that easy, swinging gait which bespeaks the soldier, and both had an air of perfect breeding which shows constant mingling with the best society.

"This is a magnificent place," said MAX, as they passed beneath the trees which formed an arch over their heads; "truly one of the stately homes of England. How I envy you English the possession of these grand ancestral estates; I would willingly barter my empty title for one. Of what benefit is it to me when the Schloss VON BERNSTEIN, the cradle of my race, is a mere heap of ruins? Better to be plain farmer SMITH."

"Nonsense, MAX," said BERTIE. "Does not your heart thrill at the recollection of the glorious deeds of a long line of ancestors?"

"You are right, lieber friend," said the German, as he placed his hand on BERTIE'S shoulder, while his dark eyes filled with light. "I *am* proud of my race, and if the opportunity should occur, I will strive to add fresh luster to the noble name of BERNSTEIN. But this is egotism. Tell me of your cousin."

"My cousin MARGARET? There is not much to tell. She only left school a year ago, to keep house for her father, who is a cousin of my mother. He is a retired Indian officer who lives on his pension and they lead a very quiet life."

"Has he been here long?"

"Only one year. My father is very fond of MARGARET and persuaded the Major to take the cottage. But here we are," and they turned out of the lodge gates and came in sight of the pretty cottage. As MAX entered the garden in BERTIE'S wake, he beheld the most enchanting picture that had ever delighted his eyes. Standing on the porch in a framework of greenery formed by the vines which were trained over a trellis-work, was a tall, slight girl, with such waving masses of chestnut hair and such violet eyes as he had never seen, even among the blue-eyed fraulein of his native land. Her skin was of a soft, creamy hue, with the faintest rose tint on the rounded cheeks. MAX never forgot this picture, but took in its every detail, even to the floating muslin dress she wore, which was of the palest mauve. A velvet band of the same color parted the gleaming waves of hair, and a similar decoration enhanced the beauty of the fair, slender throat.

"Sweet English rose," he thought, as she advanced with extended hand and her fair face glowing with pleasure, to greet Captain HEATHCOTE. "Welcome home," she said in a clear, sweet voice. "But I am afraid the poor partridges will be sorry to see you."

"I mean to make great havoc among them," answered BERTIE, as he pressed the little hand and smiled admiringly into the bright young face. "And I shall be ably seconded by one of the best shots in Europe, although he looks so peaceable. Count VON BERNSTEIN, MARGARET, of whom you have heard me speak."

MARGARET bent her head in acknowledgement of the introduction, and blushed as she felt rather than saw, the searching gaze of the Count's dark eyes. The Major proposed an adjournment to the house for tea or coffee. "Yes," said BERTIE, "we came for that; we have no fair lady at the Chace to administer the 'cup that cheers.'"

"Oh, stop, BERTIE," said Miss TREHERNE, reproachfully; "don't continue that worn-out quotation, or I shall think that what Punch says is true, and the Plungers are really devoid of originality."

"Come, MARGARET," said her father, leading the way into the house, "or your tea won't be fit to drink."

The pretty drawing-room, with its deep easy chairs, its flowing muslin curtains, the few good pictures on the pale green walls, and the light and graceful adornments in the way of bronzes and fair, snowy statuettes on tiny brackets, was a pleasant place to lounge in this sweet, summer evening. The low windows looked on the fragrant, blooming garden, and the scent of the flowers came wafted gently into the room by the soft breeze that stirred the curtains. MARGARET made tea for her guests, and as MAX received his cup from her hands and the faint, delicious perfume of violets came towards him from her delicate garments, his heart was filled with a sense of rest, a feeling of home-like peace came over him to which he had long been a stranger. MAX had lost his father when a mere youth, and had felt himself the sole guardian of his mother, whom he idolized. The VON BERNSTEINS were an impoverished family and the father had left nothing behind him, so that MAX was obliged to leave the army, where his pay was too small for the support of two people, and accept the position of attache to the Prussian Legation in London. As he was very handsome, spoke English well and waltzed charmingly, he was a great addition to the fashionable circles of Belgravia; but after his mother's death he went very little into society. Captain HEATHCOTE and Major TREHERNE were deep in conversation concerning the prospects for sport, and MARGARET addressed herself to the entertainment of the Count. "How do you like England?" she began.

"Very much indeed," he replied, rousing himself from his reverie. "I think I should like English country life better than that of the cities, however."

"Better than German country life?"

"I don't say that, for we have noble sport in our deep German forests. You have never been in Germany, Miss TREHERNE?"

"No, but papa has promised to take me very soon, and I am working hard at my German in the meanwhile. But it is slow work alone," she added, smiling.

A sudden impulse seized MAX, he hardly knew why, to say, "May I—dare I offer my services to you as teacher while I remain at the Chace?"

MARGARET blushed; what should she answer? She wished it, of course, but the offer was very embarrassing. She hesitated and seemed so confused, that MAX thought he had offended her and became angry himself. "I beg your pardon," he said coldly; "I presumed on my intimacy with Captain HEATHCOTE—" and placing his cup and saucer on the table he rose and walked towards the piano.

MARGARET looked after him in amazement. How rude of him to walk off in that manner! She had not meant to offend him. And now what could she do to conciliate him? BERTIE however came to her relief by calling out, "That's right MAX; you are going to give us some music, I hope."

"*Place aux dames*," he answered, "won't Miss TREHERNE honor us first?"

"Come, MARGARET, give us a song," said BERTIE. "I have heard no singing in London I like as well as yours."

MARGARET rose obediently and going to a pile of music, began to look out a song.

"Can I assist you?" said a deep, rich voice close beside her.

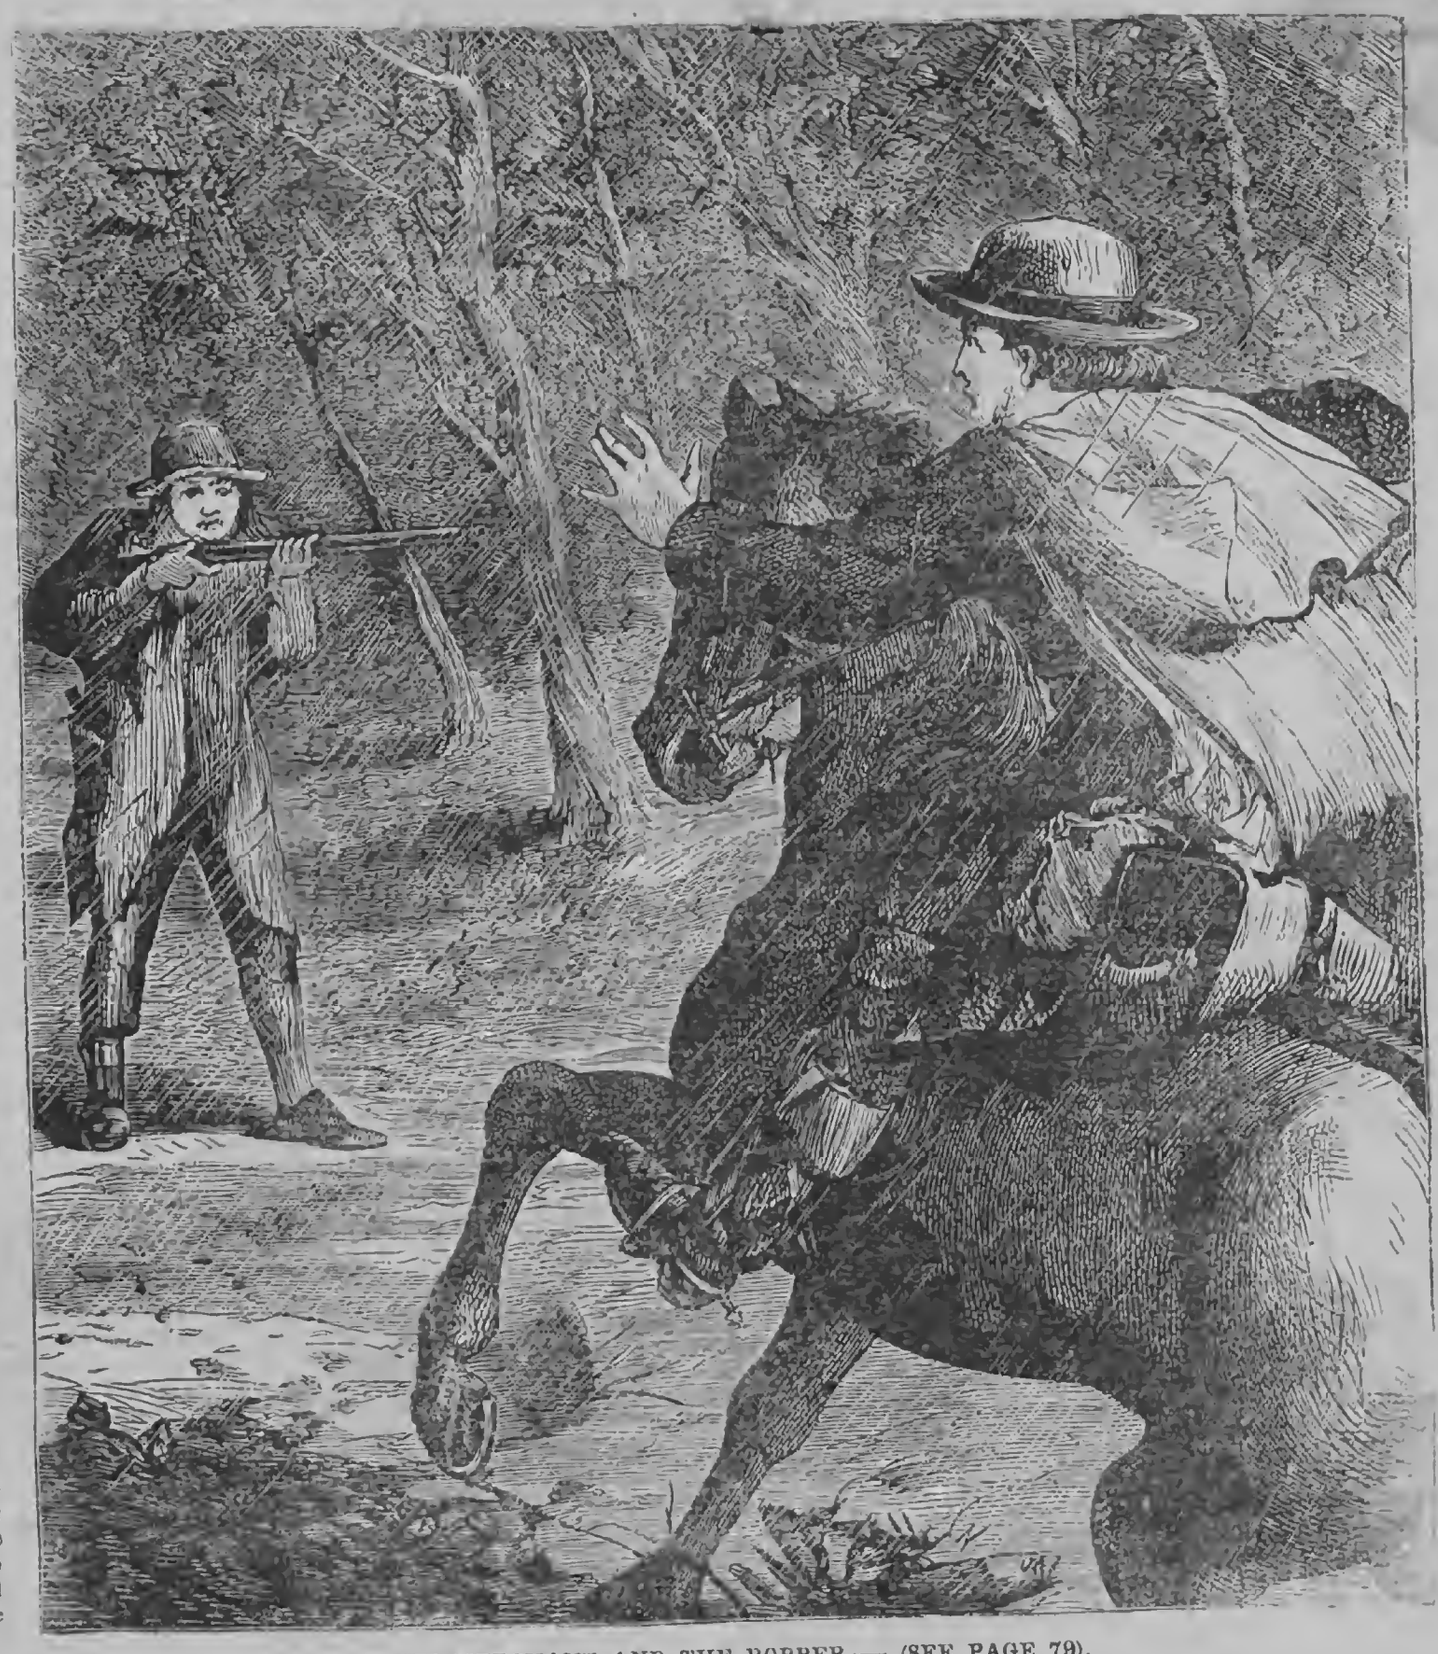
She looked up. "Thanks. I can find what I require.'

MAX turned away, but she stopped him. "Count, forgive me if I seemed rude just now, but——"

"Not so," he answered; "I was the offender."

MARGARET, can't you find a song?" called BERTIE, impatiently. She took up HULLAH'S "Three Fishers," and seating herself at the piano sang it charmingly, in spite of a slight tremor in the sweet, pathetic voice; this however added to the mournful effect of this saddest of songs.

"Oh, by Jove," said BERTIE, 'that's enough to give one the horrors. Good-by 'to the bar and its moaning,' with all my heart. But you sang it beautifully MARGARET."



THE MERCHANT AND THE ROBBER — (SEE PAGE 79).

"Now, Count," said she, rising from the piano, "I want to hear a German song properly sung."

"I am rather out of practice," he said seating himself; "but I will do my best;" and striking a few preliminary chords with a masterly hand, he sang "The Standard-Bearer" in such a rich and powerful tenor voice as would have made his fortune on any stage in Europe. MARGARET was delighted, and begged for another song.

"Give us "*Mein Hertz ist am Rhein*, MAX," said BERTIE. He complied, and sang it as though his soul was in his words.

"How you love your country," said MARGARET, as she leaned on the piano with her eyes fixed on the singer.

"I do," answered the German, turning his flashing gaze full on her; "and my fondest hope is that I may be one day able to prove my devotion by taking up arms in her behalf. You know I am a soldier by profession, nor do I think the day is far distant when she will need my services; but," he added, checking himself, "this is no conversation for a drawing-room. You see Miss TREHERNE, what a lion you have roused," and he rose and walked to where the Major was sitting.

"MARGARET," said BERTIE, "when are you coming up to the Chace? We are to have no end of fun when the fellows arrive—croquet, archery meetings, and all that sort of thing."

"But I can't go, BERTIE; you know I have no chaperone, and papa won't take me."

"O, I'll take care of you; I'll come for you every day. And now Count VON BERNSTEIN, if you are quite ready, we'll be off; I promised the Squire not to stay long."

MAX rose quickly and approaching MARGARET said in a low voice. "May I bring you a book tomorrow, Miss TREHERNE?"

"Certainly, I shall be very glad of it."

"Then you have quite forgiven me?"

"There was nothing to forgive," she said, holding out her hand. "Good night."

"*Auf wiedersehen*," he answered, giving the little hand a gentle pressure as he released it.

"Good night, MARGARET," said BERTIE. "You did not invite me, but you may expect me all the same."

"You are at home, my boy," said the Major.

"All right," said the young man laughing, as he took his way down the garden, followed by MAX. "My heart's on the Rhine," sang BERTIE, as they entered the gates of the Chace. "That's a glorious song, MAX, and you sing it in first-rate style, *con amore*. Eh, old fellow?" and he pulled his Glengary cap over his fair curls and linked his arm in that of his friend. "Your heart *is* on the Rhine, you know, with the fair Countess." MAX did not answer. "MAX, are you moon-struck?" he turned impatiently. "Honor bright," BERTIE went on, "isn't there something between you and a certain Countess?"

"What do you mean, HEATHCOTE? This is the second time you have insinuated this; what does it matter to you whether there is or not?"

"Come, don't be angry, but I must be careful how I introduce such a fascinating personage to our pretty country girls. They would break their hearts in vain." BERTIE said this in his usual good-humored fashion; but he wished his friend to know that MARGARET was only to be admired at a respectful distance.

The German laughed bitterly. "Bah!—you need not be afraid. The heir of a ruined castle cannot be a very dangerous rival to the future Lord of Heathcote. Besides, I don't think your English fraulein's are so susceptible."

BERTIE looked at the tall, lithe figure and dark refined face with the glorious eyes, and thought that he might be a formidable rival in spite of Heathcote and its owner; for he was not a vain man, this fair-haired young soldier—this blue-eyed Captain of Plungers. "What do you think of my cousin?" he asked at length.

"What can I think but that she is perfect? and that innocent, child-like manner, so unconscious of her own wondrous beauty. She is the *beau ideal* of FAUST'S exquisite 'Gretchen'"

"Aw, yes," said BERTIE, yawning. "She is charmingly fresh and innocent. She wants a season in London to improve her manners; *then*, I grant you, she would be hard to beat."

"Ah, you would destroy her greatest charm. Believe me, my friend, a woman who is ignorant of the world and its ways is one of the greatest boons that Heaven can bestow on man. My mother was such a one."

They had by this time reached the house, and in the quiet of his own room MAX had leisure to think of MARGARET. She was so different from all the women he had hitherto known—and his knowledge of the fair sex was not small, for the handsome attache with his distinguished appearance, had made a sensation in the salons. His heart amid all these temptations was still untouched; indeed, he had but to stretch out his hand now and a fair bride was willing to accept it and lay her fortune at his feet. IDA VON LANSTEIN, Countess and heiress, had been betrothed to MAX when they were both children, by their parents' arrangement of course; and the pretty IDA, who was obedience itself, had never permitted her thoughts to wander from her affianced, while MAX, on the contrary, refused to consider the contract final. He could not marry for money alone, and although he liked the playmate of his childhood, he did not love her as he wished to love the woman he would marry. This fair English girl seemed to realize his idea of what that women ought to be. "Happy BERTIE," he thought; "I wonder if she loves him? It is evident there is a marriage between them in prospect. Well, the 1st of September will soon be here, so for that short space of time it will do no harm to read German with her." And he took SCHILLER'S "Piccolomini" and "Wallenstein" out of his trunk before he retired to dream of MARGARET'S blue eyes and sweet, low voice.

The next morning MAX took his way to the cottage, where he found MARGARET in the garden watering her flowers—"a rose in roses,"—blushing brightly under her shady hat as she caught sight of him. "Good morning, Count. I suppose you have beaten Captain HEATHCOTE in getting out so early. He is generally lazy in the morning."

"I left the Captain at breakfast. I was anxious to begin at once, you see," and he showed the books he had brought.

"How delightful! I have always wished to read 'Wallenstein.' But won't you come in and see papa while I get rid of my gardening apparatus?" And she took up her watering pot as she spoke.

"Allow me," said MAX; "that is much too heavy for you."

"How weak you must think me," she said, laughing. "Pray go to papa; I don't need assistance, I assure you."

MAX obeyed, and MARGARET was soon on her way upstairs to her room, where she threw off her hat. "Hateful, unbecoming thing!" she said, as she proceeded to arrange the braids of her lovely chestnut hair. She would not change her dress; it was quite fresh and neat, and the plain brown Holland showed off the outlines of the young, round form, as well as if it had been made of silk. She descended to the study with a fluttering of the pulses, which she told herself was very foolish. What was this stranger to her? He had handsome eyes, to be sure, and they had certainly expressed admiration of her, and—but she did not go any further in her soliloquy.

Turning the handle of the door, she went into the study, where the Count and her father were deep in European politics. MAX talked well, and his manner was a judicious mixture of French vivacity and German reticence, which charmed Major TREHERNE so much that he seemed inclined to monopolize the young man entirely. MAX turned to MARGARET, however, as she entered, and rose to hand her a chair, when the Major remembered for what purpose the Count had made such an early visit.

"Well, young people," he said, "so you are going to read German;" but where is Capt. HEATHCOTE? Is he not going to join you?"

MAX reddened. The fact was he had never told BERTIE of his intention to visit the cottage so early.

"He will come to luncheon, papa, of course; he always does when he's at home."

"Very well; I will smoke a cigar in the garden." And he carried off a camp-stool and his copy of the Times, never thinking, good, easy soul, of the impropriety of leaving those two together to study German or anything else they chose in the pleasant library, with the perfume of the flowers and the sunshine coming in softly through the shady Venetian blinds. And thus began the story of these two lives, as together they bent over the same page and read the sad, sweet tale of love and death, the story of MAX PICCOLOMINI and THEKLA, and ever and anon MARGARET'S soft eyes would fill with tears at the touching record of the piteous struggle between love and duty which rent the hearts of the hapless lovers. What wonder that in reading of one MAX she thought of the real, living MAX whose dark eyes met hers whenever she raised them from the book. Ah! these were dangerous moments for MAX, who, although he knew that he was laying up a store of future misery for himself, sat there in a trance of delight, watching the bright, bent head, the rich waves of chestnut hair, and the long eyelashes, which threw a shadow on the fair, round cheek. And so the sweet summer idyl began—to end how?

"O, mornin' hope, O, mornin' life,
O, lichtsome days and lang,
When honeyed hopes around their hearts,
Like simmer blossoms, sprang."

[Conclusion next week.

WINTER AMUSEMENTS.

DR. HOLLAND writes as follows, in Scribner's, on the subject of Winter Amusements:

It is an easy thing to establish, either in country or city neighborhoods, the reading club. Twenty-five young men and women of congenial tastes, habits and social belongings can easily meet in one another's houses, once during every week, through five or six months of the year. With a small fund they can buy good books, and, over these, read aloud by one another of their number, they can spend an hour and a half most pleasantly and profitably. They will find in these books topics of conversation for the remainder of the time they spend together. If they can illuminate the evening with music, all the better. Whatever accomplishments may be in the possession of different members of the club may be called upon to give variety to the interest of the occasion. This is entirely practicable everywhere. It is more profitable than amateur theatricals, and less exhaustive of time and energy. It can be united with almost any literary object. The "Shakespeare Club" is nothing but a reading club, devoted to the study of a single author; and Shakespeare may well engage a club for a single winter. Such a club would cultivate the art of good reading, which is one of the best and most useful of accomplishments. It would cultivate thought, imagination, taste. In brief, the whole tendency of the reading club is toward culture, the one thing, notwithstanding all our educational advantages, the most deplorably lacking in the average American man and woman.

There was a time when the popular lecture was a source not only of amusement but of culture—when it stimulated thought, developed healthy opinion, conveyed instruction and elevated the taste. The golden days when Sumner, Everett and Holmes, Starr, King and Prof. Mitchell, Bishop Huntington, Clark, Beecher and Chapin, Emerson, Curtis, Taylor and Philips were all actively in the field, were days of genuine progress. Few better things could happen to the American people than the return of such days as those were; and the "lecture system," as it has been called, is declining in its usefulness and interest simply because it has not men like these to give it tone and value. A few of the old set linger in the field, but death, old age, and absorbing pursuits have withdrawn the most of them. The platform is not what it was. The literary trifler, the theatrical reader, the second or third rate concert, have dislodged the reliable lecture-goers, and the popular lecture will certainly be killed if bad management can kill it. The standard has not been raised or even maintained; it has been lowered—lowered specially, and with a direct purpose, to meet the tastes of the vulgar crowd.

Well, the young people, in whose hands the "lecture system" has always been, can mend all this, if they consider it worth the pains. Certainly, the coming into contact with a thoroughly utilized man of brains is a very stimulating experience. The privilege of doing so should not be lightly relinquished; and, whenever a course of lectures is well conducted, it ought to meet with a generous patronage from all who have young people on their hands to be entertained and improved.

But even the lecture, desirable as it is, is not necessary. In a city like New York there ought to be five hundred clubs of young people established this very winter for the purpose of social and intellectual amusements with culture in view as the great ultimate end. The exercises may take a great many forms which it is not necessary for us even to suggest. Books may be read, original papers may be presented, musical rehearsals may form a part of the entertainment, products of art may be exhibited, there may be dramatic and conversational practice, and practice in French and German. There is no limit to the variety of exercises that may be profitably entered upon. And what is good for the young people of the great cities will be just as good for young people everywhere.

SPEECH OF A MISSISSIPPI EDITOR.

AT a reception to an excursion party of Mississipi editors, at Buffalo, N. Y., Mr. S. H. Stackhouse, of the Hazelhurst (Miss.) Copiahan, made the following reply to the address of welcome:—"When the Queen of Sheba visited old Solomon's dominions in the ancient time, flew over the hills and dales in his lightning railroad trains, sailed over his great lakes in his big steamers, rode upon his keel boats as they plowed his canals, examined critically his farms and his machine shops, she finally made her way to the headquarters and formally interviewed the thrifty old autocrat of all the Jews; and in that interview candor constrained her to acknowledge that although she had heard much of his greatness and magnificence, yet the half had not been told her. So it is with us, fellow-citizens of Buffalo, in reference to this tremendous country you have got. We have heard a great deal about you. We have read much concerning you in your big newspapers, of your thrift, your push, your genius, enterprise, wealth, progress and irrepressibility. But now since we have traversed a considerable scope of your grand domain, we are, like the Queen of Sheba, forced to acknowledge that the half has not been told us.

"We are not going into any war with you fellows. If we had known how confounded numerous you were—what vast resources you had—what a nation of get up and gitters you are—we should never have been guilty of the absurdity of trying to whip you in the first place. Now that we have seen for ourselves, and gotten some sort of an idea of the magnitude of the job of cleaning you out, we consider that another war on our side would be preposterous and ridiculous, and we are for peace. Yes, fellow-citizens of Buffalo, we are here in the interest of peace—God-like peace. In the glowing language of the inspired psalmist, "Peace hath her victories no less renowned than war." We believe in peace. We are quite ready to be harmonized. And I am glad to be able to say that everywhere we have been in the North and West we have met with a cordial welcome and kindly greeting. Nobody has made faces at us. We have felt O. K. all the time. The railroads have deadheaded us and given us the finest drawing-room cars to sleep in. The hotels reduced their rates and some of them didn't have the heart to charge us at all. We have been fed at all your eating institutions where we have stopped. In some places they wined us and they dined us, rode us out in carriages and showed us the sights, made speeches to us, serenaded us with their brass bands, etc., etc. We have had just a splendid time of it. The ladies (God bless 'em, always) have smiled upon us, and the men have sometimes even gone to the extent of asking us to take a drink. That last is the capstone to the climax of reconciliation. [Hear, hear!] The true road to a Mississippi editor's heart is to invite him to take a drink with you. If that don't harmonize him—if that don't capture him—if *that* don't bring peace to the land and save the country, nothing else on earth will."

SINCERITY—Give us sincere friends, or none. This hollow glitter of smiles and words—compliments that mean nothing—protestations of affection as solid as the froth from champagne—invitations that are but pretty sentences, uttered because such things are customary—are all worthless. There is no need of them.

To know how to keep a tidy house and well-aired apartments; to know how to select the best kind of food; to know how to prepare them in the best manner—these are the first things—and every daughter should learn them before marriage.

Sabbath Reading.

ANGEL WHISPERS.

I LOVE the long, long hours of night,
For as I sweetly rest,
And dream of all things fair and bright,
An angel is my guest.
Her voice is soft, and full of love,
And fills me with such peace
That often as I hear, I wish
The night might never cease!
Little thoughts of heaven,
Little dreams of love,
Little drops of gladness,
From the world above!

She tells me of her wondrous home
Where winding streamlets flow,
Where all is bright with living light,
And flowers of beauty grow!
There little angel-children live,
Forever free from sin,
For through those heavenly gates of pearl
No harm can enter in!
Little ones of God,
Pure and sweet and fair,
Plucked so soon from earth—
Bloom in beauty there!

There's something else the angel tells
For me to learn, mamma,
The way to find those mansions blest—
The path that leads so far,
Is right amidst our daily life—
A straight and narrow way.
And though it seems so dim, so dark,
It leads to endless day!
Angel-whispers low,
Through the silent night,
Make its darkest hours
Bright with heavenly light!

MOODY'S FIRST REVIVAL WORK.

A CHICAGO correspondent writes:—It will hardly be believed that when Dwight L. Moody, many years ago, began to speak in religious meetings here, he made such poor work with syntax that some one suggested to him that he keep silent lest his blunders should annoy the other attendants. But Moody kept on talking, doing his work for awhile largely in by-places, among the poorer class. When I first knew him, twelve years ago, he had a mission school in the North Market Hall. Prior to that time he sometimes held meetings in an old shanty which had been used as a drinking saloon, and had become so ricketty that it was abandoned for such a purpose. Mr. Reynolds, an Illinois layman, who always has "a mind to work" for Christ, thus describes Mr. Moody as he first met him in that shanty:

"I went there a little late, and the first thing I saw was a man standing up, with a few tallow candles around him, holding a negro boy, and trying to read to him the story of the Prodigal Son, and a great many of the words he could not make out, and had to skip. I thought if the Lord could ever use such an instrument as that for His honor and glory it will astonish me. After that meeting was over Mr. Moody said to me, 'Reynolds, I have got only one talent; I have no education, but I love the Lord Jesus Christ, and I want to do something for Him, and I want you to pray for me.' I have never ceased, from that day to this, morning and night, to pray for that devoted Christian soldier." Who can tell how much the spiritual growth and success of Bro. Moody owe to the prayers of such men as Bro. Reynolds?

Chicago has several other laymen who are successful as preachers, among whom may be mentioned B. F. Jacobs, C. B. Blackall and J. W. Dean. The first two are known the country over as great Sunday school workers.

GROWING OLD.

IT is the solemn thought connected with middle life, says the late eloquent F. W. Robertson, that life's last business is begun in earnest; and it is then midway between the cradle and the grave that a man begins to marvel that he let the days of youth go by so half-enjoyed. It is the pensive autumn feeling; it is the sensation of half sadness that we experience when the longest day of the year is past, and every day that follows is shorter, and the light fainter, and the feebler shadows tell that nature is hastening with gigantic footsteps to her winter grave. So does man look upon his youth. When the first gray hairs become visible, when the unwelcome truth fastens itself upon the mind that a man is no longer going up hill but down, and that the sun is always westering, he looks back on things behind. When we were children we thought as children. But now there lies before us manhood, with its earnest work, and then old age, and then the grave, and then home. There is a second youth for man, better and holier than his first, if he will look on and not back.

READING THE SCRIPTURES—Suppose you have only a few moments every day. One of the holiest men I ever knew never read more than five or ten verses at once. Every verse had so broad and many-sided signification, that a few words gave him as much mental food as he could bear at one time. Throughout the day they came upon him in all their various applications and shades of meaning, as circumstances placed him in one position and now in another.

TAKE care that all is done in a sweet and easy way; make no toil or task out of the service of God. Do all freely and cheerfully without violent effort.

THE love of man is good while it lasteth; the love of God is better, being everlasting.

Ladies' Portfolio.

MUSIC.

BY MRS. S. F. HINCKLEY.

Music hath rich, enchanting strains,
That make life's pathway brighter,
And by their power the weary hour
Is often rendered lighter.

It nerves the patriot's arm with strength,
And fills his heart with fire,—
Amid the battle's ceaseless din,
His throbbing pulse beat higher.

'Tis said beside the dying couch
There's music soft and sweet,
That harps low tones are mingled with
The fall of angels' feet.

Beauty and music—hand in hand
They walk this earth of ours,
And each bright thing in nature thrills,
Charmed with their mystic powers.

There's beauty in the lightning's flash,
When storm clouds darkly lower,—
And music in the water's clash
Along the sounding shore.

There's beauty in the flower so pale,
That blooms so sweet and lowly,
And lifts its dewy chalice up
To HIM so high and holy.

There's music 'mid the dark-leaved trees,—
A hundred birds are singing—
And all the pulse of Nature thrills,
And all the woods are ringing.

And everywhere we see outspread
The leaves of music lie,—
And Nature plays the keys, and we
Stand idly dreaming by.

ABOUT HOUSEKEEPING.

BY AMELIA.

WE often hear the remark that such and such persons are good or poor housekeepers, as the case may be, but we seldom stop to think that good housekeeping is an accomplishment that very few, comparatively, possess. Girls are not brought up as they were fifty years ago. As the country has grown richer work has become more of a drudgery, and while the young lady of to-day idles away her time BRIDGET does the housework. Of course there are exceptions; still, I think, there is too little attention paid to teaching girls when young the rudiments of housekeeping. It will do no one any harm to know how to do all kinds of work, and we live in an uncertain age, when riches take to themselves wings and fly away so easily that it is sometimes convenient to be able to take care of oneself.

Hardly any two work alike. Some cook splendidly and require an abundance to cook with, while others will make a good deal of nothing. Some are painfully neat. They keep their rooms shut up for fear of sunlight and flies, and every step is light for fear of dirt. The dog and cat have a pinched, far-away look, as if they meditated suicide; and it is a real relief to step into another house where, perhaps, things are not in half as good order, but you are not afraid of putting them out of place.

Frugality, we have always been told, is another requisite for a good housekeeper, but I presume we have all seen those who possessed it to such a degree that it ceased to be a virtue, while others will "throw out of the window much faster than can be put in at the door." And now, as we notice the great difference in people, is it not true that good housekeeping is an accomplishment? There are so many things that are necessary to make home pleasant and agreeable—books, flowers, and all those little elegancies that make a house attractive. "I have so much to do I can never find time to read, much less to cultivate flowers and make ornamental things!" I say those who do the most generally have the most time. It is those women who will turn around all day in a half bushel that have no time.

Calculate your work so as to get it done. Do not be forever fretting at nothing. Be neat, but not so neat as to make everybody uncomfortable. Cultivate flowers and a love for the beautiful in nature and art, and never allow your mind to become so warped that you cannot think of anything but your housework. Read, and be in every sense an intelligent and accomplished woman; then will you be an accomplished housekeeper.

Cayuga, N. Y., 1876.

TO WHOM SHE SAYS NO.

A WOMAN never quite forgets the man who once loved her. She may not have loved him, she may, indeed, have given him a "no" instead of the "yes" he hoped for; but the remembrance that he desired a "yes" always softens her thoughts of him, and would make him, were he reminded of it, a friend forever. There may be girls who make a jest of discarded suitors; but they are generally very young; and the wooing has been something that did not betoken much depth of tenderness. There are mercenary offers, too, that only awaken scorn and hate in the woman wooed for money and not for herself; but, really, to have touched a man's heart is something not to be forgotten by her as long as she lives.

Always she will remember how his eyes looked into her's when he touched her hand with his, and how her heart ached when he turned away without that which she could not give him.

She loved some one else. Some other man has all the truth of her soul—always has, and always will have—but she cannot forget the one who turned from her and went his way, and came no more. She is glad when she hears of his success, grieved when she knows that he has suffered, and when some day she hears that he is married—she who has herself been married for long years, perhaps—she who, at all events, would never have married him—is she glad then? I do not know—A woman's heart is a very strange thing. I do not believe she knows herself. Glad? Oh, yes—and his wife pretty and nice? And then she says to herself that "he has quite forgotten," and "that, of course, is best," and cries a little.

TRUTH STRANGER THAN FICTION.

SEVENTEEN years ago, says the Boston News, William Lester, a poor carpenter, died in Boston. Three of his children were taken West by a friend, and the fourth, a little girl, was placed in a Boston asylum. Last September the only survivor of the Western members of the family came East in search of his long lost sister, having himself become very wealthy. He found that the girl had been adopted by John Wheeler, a dry goods merchant, but he had been dead a dozen years, and there was no trace of the girl's whereabouts since. Being discouraged he started West again, but on the train, a little way out of Boston, he noticed among a bevy of girls who entered the cars one who remarkably resembled his mother. He left the train when they did, and soon found that it was indeed his sister, who was living with her poor adopted mother. She had never been told that she was an adopted child, and it was long before she realized her situation. The young lady could not be prevailed upon to accompany her brother West, but as she looks upon the luxuries with which she and her adopted mother have been surrounded by her brother she enjoys the pleasures of a real romance.

EARLY INFLUENCES.

THERE can be no greater blessing than to be born in the light and air of a cheerful, loving home. It not only insures a happy childhood—if there is health and a good constitution—but it almost makes sure a virtuous and happy manhood, and a fresh young heart in old age. We think it every parent's duty to try to make their children's childhood full of love and of childhood's proper joyousness; and we never see children destitute of them through the poverty, faulty tempers, or wrong notions of their parents, without a heartache. Not that all the appliances which wealth can buy are necessary to the free and happy unfolding of childhood in body, mind, or heart—quite otherwise. God be thanked; but children must at least have love inside the house, and fresh air and good play, and some good companionship, outside—otherwise young life runs the greatest danger in the world of withering or growing stunted, or sour and wrong, or at least prematurely old and turned inward.

FOR AND ABOUT WOMEN.

MRS. KENT MASON has been lecturing to large audiences at St. John, N. B.

MRS. KATE CHASE SPRAGUE of Providence, R. I., is spending the winter in Paris.

MRS. CRAIK'S "Sermons Out of Church," are published by the Messrs. Harper.

QUEEN VICTORIA personally conducts a Sunday School for the children connected with Windsor Castle.

MRS. CHARLES WASHBURN is the President of the Worcester Co. branch of the Massachusetts Woman's Board of Missions.

STATISTICS are given to prove that of the sum total of human misery, physical and mental, women have to bear two-thirds.

MRS. ADELAIDE MURDOCH, a sister of James E. Murdoch, is in San Francisco, where she proposes to lecture on women's duties.

MARIAN SINGER, one of the numerous children of the sewing-machine inventor, has appeared upon the stage in San Francisco in burlesque.

SARAH W. DEVOLL, M. D., was elected orator for the coming year by the Cumberland County (Maine) Medical Society, at its recent annual meeting.

MISS ANNA DICKINSON is said to be in such an unsatisfactory state of health that her physician has ordered her to abandon all work and take a sea voyage.

MRS. ASA SHERMAN of Marshfield, Mass., is 100 years old. Her husband died at the age of 97, and she has five children living, whose ages are 76, 75, 68, 66 and 62.

MISS BETTINA DE ROTHSCHILD, the eldest daughter of Baron Alphonse de Rothschild of Paris, and Baron Albert de Rothschild of Vienna, are to be married early in the spring. Money marries money.

MISS LAVINIA GOODELL read an address on "The Temperance Reform, a Necessary step in the Progress of Civilization," at the Annual Meeting of the Woman's State Temperance Alliance of Wisconsin.

MRS. ABBY SAGE RICHARDSON, having finished a course of "Twelve Familiar Talks on English Literature," a number of her friends, including Miss Alcott, have adopted and presented to her a set of complimentary resolutions.

MISS FANNIE E. TOWNSLEY, the woman evangelist, has closed her labors at Wallingford, Vermont, where sixty persons have been converted under her preaching. She has been presented by the people there with a $20 Bible and $125 in money.

Reading for the Young.

THE SPELLING CLASS.

SEE that crevice in the floor—
Slender line from desk to door,
First meridian of the school,
Which all the scholars toe by rule.
Ranged along in rigid row,
Inky, golden, brown and tow,
Are heads of spellers high and low,
Like notes in music sweet as June,
Dotting off a dancing tune.

Boy of Bashan takes the lead,
Roughly thatched his bullet head;
At the foot an eight-year-old,
Stands with head of trembling gold;
Watch her when the word is missed!
Her eyes are like an amethyst,
Her fingers dove-tailed, lips apart;
She knows that very word by heart!
And swings like any pendulum,
Trembling lest it fail to come.
Runs the word along the line,
Like the running of a vine,
Blossoms out from lip to lip,
Till the girl in azure slip
Catches breath and spells the word,
Flits up the class like any bird,
Cheeks in bloom with honest blood,
And proudly stands where Bashan stood.

* * * * * * * * *

"Attention!" Now—"Obeisance all!"
The girls' short dresses touch the floor,
They drop the courtesies at the door;
The boys jerk bows with jack-knife springs,
And at the doors they all take wings.

[*B. F. Taylor.*

THE MITTENS.

Do you want to know why little children wear mittens, and not gloves like grown persons? Listen, and I will tell you.

Once upon a time, a mother went out and said to the five little fingers:—"Children, when I am not at home, behave well, and do what I tell you. If you are kind and obedient, I will bring each of you a little house, where you can live when it is cold winter."

"O mother!" exclaimed the five fingers, "we will certainly mind; only tell us what we must do."

Then their mother answered:

"The fore-finger must point abroad,
The middle-finger can only nod,
The third-finger strict guard must keep,
Lest the little one into mischief creep,
And the baby thumb must watch and see
That all the rest obedient be."

"Now go, mother dear," said the fore-finger, "I'll certainly be attentive, and point prettily, if you will only bring me something."

Then the middle-finger cried out, "I will promise to be polite and bow nicely, if you will bring me a little house, too, for I'm the biggest one!"

"I will certainly keep watch, that my little brother does not get into mischief," cried the ring-finger; "but my house must be the prettiest!"

"No, mine!" exclaimed the little-finger; "mine must be prettier than all the rest—and then I won't make a bit of noise."

But the baby-thumb only said, "Mother, dear, I will do just what you say!"

But their mother had only been gone a few minutes, when the fore-finger exclaimed:

"It is very stupid and tedious to be so good, and to point all the time. I want to rest a minute." So he lay down.

"Ah, you lazy thing!" replied the middle-finger; "it is much more fatiguing to be so industrious, and bow all the time," and he was going to lay down, too; but the fore-finger jumped up, and gave him a blow, crying, "How dare you find fault with me! You are lazy yourself, you wicked boy!"

Then the middle-finger struck him again, the fore-finger returned it; and who knows how long they might have fought, if the ring-finger had not called out:

"Aren't you ashamed of yourselves? One of you is as bad as the other. See how I torture myself, and stand here keeping watch all the time. I mean to stop and rest, and let you great fellows keep guard over your little brother!"

"What!" exclaimed the fore-finger and middle-finger. "You little rogue, do you pretend to dictate and find fault with your brothers? There, stop now!"

Then they both began to beat the ring-finger. He turned, with all his strength, and struck the little-finger, which he had the care of. The little one gave a dreadful scream, and began to scratch, as well as he could. But just as they were in the hottest of the fight, the door opened and the mother came in.

Oh, how frightened the naughty fingers were! They hung their heads, and were so ashamed they could not speak.

Finally, the middle-finger said that the fore-finger was lazy, and he would not allow it. But the fore-finger laid the blame on the middle-finger, and said he began the quarrel. The ring-finger blamed them both, and the little-finger complained of all.

Then their mother spoke, and said:

"You are four naughty, disobedient children, who deserve to be punished. See here, what I have brought for you!" And she drew a beautiful glove out of her pocket. On it was found five houses, just as large as the five fingers. One was for the thumb; one for the fore-finger; one for the middle-finger; one for the ring-finger, and one for the little-finger.

"But you cannot have these pretty houses now," said the mother. Then she went out, and soon returned with another kind of glove.

"Look!" she exclaimed, "this has only one separate house, which belongs entirely to little thumb, because he is good and obedient. You others must live together, and as soon as you become kind and obedient, then you shall have a house of your own."

And there it was; the four fingers might entreat as much as they could, it would not help them. Ever since this time, many little children wear mittens; but when they grow tall, and become good, then they can wear gloves.

THE MERCHANT AND THE ROBBER.

[SEE ILLUSTRATION, PAGE 77.]

AN English merchant was riding home from market, and had behind him his knapsack, in which there was a large sum of money. It rained heavily, and the good man was soon wet through, which annoyed him very much, and he complained of the weather being so bad while he was obliged to travel.

His way led through a thick forest. As soon as he had entered it he saw to his dismay a robber, who aimed at him with his gun. He must have been killed on the spot, but the rain had made the powder so damp that the gun missed fire. The traveler put spurs to his horse and escaped the danger.

As soon as he was in safety he said to himself, "How very foolish I was to complain of the bad weather, instead of bearing it patiently, as sent from God! If the sky had been bright and the air dry I might at this moment have been lying dead, and my wife and children would have expected me in vain. The rain of which I complained has saved both my life and my property. For the future I will never forget what the proverb says:

"'Take from God's hand whate'er He will bestow;
'Tis best for thee, although it seem not so.'"

A TRUTH.—It was like the song of some wonderful bird, and it made the air shine after the sound had died away; and yet it was just the remark of a brave young men who walked past me arm-in-arm with a companion:—"Depend upon it, Tom, St. Edmund of Canterbury was right when he said to somebody, 'Work as though you would live forever. Live as though you would die to-day.'"

BE frugal, not mean; prudent, not subtle; complaisant, not servile; active in business, but not its slave. There are also four other habits which are essentially necessary to the happy management of temporal concerns; these are punctuality, accuracy, steadiness and dispatch.

LET me deserve well, though I be not advanced. The conscience of my worth shall cheer me more in others' contempt than the approbation of others can comfort me against the secret check of my own unworthiness.

The Puzzler.

ILLUSTRATED REBUS.—No. 4.

☞ Answer in two weeks. L. G.

BIBLICAL ENIGMA.—No. 2.

I AM composed of 19 letters:
My 1, 18, 13, 4 was a mountain mentioned in Genesis.
My 5, 16, 10, 8 was the father of a mighty hunter.
My 6, 3, 17, 9 is a small wild animal.
My 8, 2, 15, 6 was the ancestor of a tribe.
My 11, 3, 17, 7 is a wheeled vehicle.
My 14, 8, 16, 7 was a grandson of Noah.
My 19, 6, 16, 12 was a wilderness in which the children of Israel traveled.
My whole is a Divine command.

☞ Answer in two weeks. ISOLA.

CHARADE.—No. 1.

My first is a lady who is not wed;
In my second is found a prisoner's bed.
My third is what the hens should do;
On my fourth your lover kneels to you.
My fifth you'll see means you and me;
My whole is mixed, whate'er it be.

☞ Answer in two weeks. C. S.

PUZZLE.—No. 1.

IN the beginning of eternity,
And in the end of space;
In the beginning of end,
And in the end of time and place.

☞ Answer in two weeks. M. P. A.

PUZZLER ANSWERS.—Jan. 15.

HIDDEN STATES No. 1.—1. Nevada; 2, Florida; 3, Indiana; 4, Ohio; 5, Vermont; 6, Utah; 7, Colorado; 8, Oregon; 9, Nebraska; 10, Alaska; 11, Iowa; 12, Connecticut; 13, Texas; 14, Maryland; 15, New York; 16, Mississippi; 17, Maine; 18, Montana; 19, Illinois; 20, Missouri; 21, Delaware.

BIBLICAL ENIGMA No. 1.—Christ's Sermon on the Mount.

PUBLISHER'S SPECIAL NOTICES.

The Rural is a very good present to send to a friend, and it pleasantly reminds the recipient of the donor fifty-two times a year—this year fifth-three times. Any *subscriber* can send it to a relative or friend, as a present, at our lowest club rate—only $2.15, including postage.

Holiday Presents will be plenty this year among our Agent-Friends and others who form clubs for RURAL. Our list comprises many articles appropriate for presents. Induce a few of your friends to take the RURAL, and thus secure a Premium.

Officers of Agricultural Societies and Clubs, Granges, &c., can, if they will, materially aid in augmenting the circulation of the RURAL. Scores of such are already forming clubs; how many others will kindly do likewise?

Renew early if you would secure the uninterrupted continuance of the RURAL to your address; and pray don't forget to ask friends to join you in sending for the Fifty-three Numbers which we shall publish during 1876.

Back Numbers of this Year (from Jan. 1) can be furnished to all new subscribers, but we shall not send them hereafter unless specially requested. Those who desire can begin with any number, however.

The Best Paper, and the Best Premiums to Agents, is our motto. We ignore Chromos and all other cheap colored pictures, preferring to put our money *in the paper*, and in Premiums to Agents.

Select Your Premiums.—All persons entitled to Premiums will please designate what they prefer and notify us how and where to forward—whether by Freight or Express—if articles are not mailable.

Act as Agent!—Reader, if there is no agent for the RURAL in your locality please become one by forming a club. *It will pay.*

At Our Risk.—You can remit by Draft, P. O. Money Order or Registered Letter *at our risk.*

News of the Week.

CITY vs. COUNTRY.

THE City of Rochester is having another of its periodical agitations for a new charter. The dodge this time, aside from some real improvements, lies in creating five new wards, making 21 in all, which, by a curious coincidence, is just two more than the number of towns in the County. This will give the city a majority of the County Supervisors and entire control of appropriations, assessments and equalization. Possibly the city would thus secure some temporary advantages; but will a bill arbitrarily increasing the number of Supervisors from a locality for the scarcely disguised purpose of giving it political control of a County, pass the State Legislature? Besides, the extravagance of city authorities in city matters makes it doubtful whether the city itself would gain by assuming direction of County matters. Country members of the Board of Supervisors have generally served as a conservative check on city extravagance, and the best interests of all parties require that their influence should not be materially lessened.

THE FAST MAIL.

POSTMASTER-GENERAL JEWELL adheres to the belief that the Fast Mail train is an immense and indispensable public convenience. He denies that it costs the country any considerable amount—a few clerks or so, at an expense of not to exceed $30,000 per year. The railroad companies are paid by the weight of mails, the same whether carried slow or fast. But this is not stating the question fairly, and the P.M.-Gen. ought to know it. The Fast Mail costs the railroads a large amount more than the slow one. Wear of stock and track, and danger, are each greatly increased, and for these the railroad companies will have pay as soon as present contracts run out, with a heavy margin of profit for "back pay" under old contracts. Meanwhile, the Fast Mail is falsely blazoned as a great public necessity, to prepare the way for extortionate demands from the railroads when the proper time comes.

HOME NEWS PARAGRAPHS..

WITHIN five years 70,000 Chinamen may vote in California. Ten thousand may vote in San Francisco and wield one-third of the electoral power. That is, they may, if they choose, name, five years hence, the Mayor of San Francisco and Governor of California.

The Treasurer of Maine has has made his report for 1875, showing the finances of the State to be in sound condition. The receipts for the year were $1,563,775,43; balances on Jan. 1, 1875, $322,185.84. The disbursements for the year were $1,513,857.43; cash on hand December 31, 1875, $377,093.84. The estimated receipts for 1876 are $1,671,699.63, and the expenditures $1,553,490.30. The tax for 1876 will be four mills on the dollar.

Orange County is probably ahead of all others on entertaining tramps. Since the 8th of March last Poormaster Carr has harbored and fed 2,137 of that idle and predatory class.

Mr. John Vance Cheney, in the first of a series of articles on the "Poets of America" in this week's Appletons' Journal, says the first book published in this country was a version of the Psalms by the combined clergy of New England. It appeared in 1640, and in a quaint preface was this apology: "If, therefore the verses are not always so smooth and elegant as some may desire or expect; let them consider that God's altar needs not our polishings."

Miss Ude Zzuda, a young lady at school in New York City, has written to the Japanese Gazette, suggesting the following reforms in her native country: First, the conversion of the whole population to Christianity; second, an increased importation of scissors; third, a restriction of taxation; and fourth, the introduction of the American custom of wedding breakfasts.

The mangled body of a boy was found recently by a party of hunters in the woods near Wesson, Miss., life being barely extinct. The hunters supposed that the murderer would return to hide the corpse, and they hid near by. A negro soon came and, when accused, confessed that he had shot the boy's dog, and then killed the boy for fear that the death of the dog might get him into trouble. The hunters decided unanimously by ballot that he ought to die, and at once hanged him to a tree.

The Idaho gold mine, California, produced last year $492,919 in gold, and paid $172,050 in dividends. The average value of the ore produced by the Idaho mine was $17.63 per ton. The production of the principal mines of California and Nevada for 1875 was as follows: Consolidated Virginia, $16,840,300 Crown Point, $3,124,052; Belcher, $3,107,992; Ophir, $2,382,990; Eureka Consolidated, $1,707,672; Northern Belle, $851,700; Raymond & Ely, $698,635; Chollar-Potosi, $288,017; total, $22,000,059.

A fire at Canarsie, Long Island, Jan. 19, destroyed a large number of passenger cars, three engines and one hotel. Total loss is $40,000; insured for $25,000. All steam travel is destroyed for the present.

The Centennial Appropriation bill was defeated in the Virginia House by a vote of—ayes, 56; noes, 58.

Ex-Sheriff George C. Mills of Alleghany County, Mich., committed suicide by drowning himself, at Plainfield, last week.

There is considerable excitement over the alleged discovery of rich silver quartz just off Maine street, Biddeford, Me.

The port of Wilmington, N. C., just now presents an appearance more active and business-like than ever before. From Parsley's mills to the distilleries, a distance of nearly two miles, vessels of almost every nationality are seen either anchored or in the stream or taking and discharging cargoes at the wharves. A large proportion of them are German vessels.

The opening in the Kings County Penitentiary of a night school for the instruction of convicts whose conduct renders them worthy of encouragement, is a step toward turning our prisons from schools or crime into reformatory institutions. The herding of men between stone walls can do them no good, for men are no more subdued by confinement in cages than are wild beasts.

On Jan. 20 an incendiary fire in the large four-story warehouse on Prince st., Buffalo, owned by Mrs. L. H. Austin, caused a loss of $29,000; insurance, $19,100. C. W. Buell had 1,800 barrels of flour spoiled.

At Greenfield, Mass., the part of the Amidon factory used for making children's carriages was burned Jan. 19. Loss, $18,000; no insurance.

The New Jersey Historical Society held its annual meeting on Jan. 20. The Rev. Dr. Hamill was elected President. A very interesting paper on "The Life of John Witherspoon" was prefaced by John McLean, ex-President of Princeton College. The meeting was well attended, and it was resolved to have a Centennial celebration at Princeton on the 2d of July, that being the day in 1776 when New Jersey declared herself a free and independent State.

Arthur P. Devlin lectured at Dover, N. H., Jan. 19, on "Romanism in America." After the lecture a crowd followed him to his hotel, on the way to which he fled into a drug store for safety, when bricks were thrown the windows, and the Mayor was compelled to read the riot act. The police finally succeeded in getting him to the hotel, not, however, without being compelled to use their revolvers. No one was injured.

Since Dec. 1st 600 persons, nearly all colored, have emigrated from Georgia to the Western and Cotton States, while 250 negroes have left the turpentine districts of North Carolina for Florida in the last fortnight.

The City Council of Richmond has passed a resolution requesting the Mayor to act in conjunction with the citizens of Boston in appealing to Congress to erect a marble monument at Yorktown to commemorate the battle of Oct. 19, 1781.

Walnut logs are in such demand that a man who recently purchased a farm of 250 acres near New Albany, Ind., for $10,000 received an offer of $9,600 for 120 large walnut trees growing on the place. There are also on the farm over 200 poplars, worth from $20 to $30 per tree.

It is urged that the California Legislature should pass a law defining the rights of the children of white fathers by Indian mothers, now classified as Indians, and the children of Chinese parents, regarded as natives of their fathers' country. In the northern counties there are over 1,000 half-Indian children, and in the vicinity of San Francisco and Sacramento about 3,000 Chinese children, all fast approaching legal majority.

Prof. Pepper, the well-known savant, has had Oakey Hall's bad luck on the stage. His project was a play in which optical and chemical effects would be an important part, and he wrote one entitled "The Alchemist's Daughter," assigning to himself the role of the alchemist. The piece was produced in St. Louis, and Mr. Pepper failed hilariously as an actor. That was the opinion he entertained himself, and the theater-going public unanimously coincided with that view. Mr. Pepper at once decided upon a generous "act," and resolved that his first appearance should also be his last. On the next night an actor "to the manner born" did well in the part, and the Professor managed the scientific effects from behind the scenes.

At the Republican Legislative caucus at Augusta, Me., Jan. 20, delegates and alternates were chosen to the Republican National Convention. A resolution was unanimously passed that the Hon. James G. Blaine is the choice of the Republicans of Maine for President.

The Board of State Prison Inspectors has met at Sing Sing, and the following appointments are known to be made:—Agent and Warden, George R. Young of Yates County; Clerk, Samuel S. Whallon of Cattaraugus; Chaplain, Rev. John W. B. Wood of Orange; Storekeeper, E. Curtis Topliff of Cattaraugus; Matron of the Female Prison, Mrs. H. F. Clark of Cayuga.

At North Hoosick, N. Y., Jan. 18th, R. Carpenter & Co.'s woolen mills and store burned. Loss $175,000; insurance $100,000. Two thousand operatives are thrown out of employment. The Troy & Boston railroad bridge across the Walloomsac, near the mill was also burned. Loss, over insurance, $2,000.

Shaw & Stewart's drug store at Brazil, Ind., was destroyed by fire Jan 19. Loss, $5,000.

Gray's Opera House, Rome, O., was burned on Jan. 19; loss, $7,000. Frost & Co.'s dry goods store adjoining was damaged $14,000; insured for $7,000.

On the morning of Jan. 19, a fire broke out in the Lehigh Valley Company's Prospect Shaft, near Wilkesbarre, Pa. An explosion of gas followed, causing considerable damage to the mine. Owing to the bursting of the water pipe the flames could not be extinguished. Some of the men were severely burned while attempting to do so. The mine is now being flooded with water for the purpose of extinguishing the fire.

Henry C. Kibbe, Secretary of the Belcher, the New York, the Jackson, and the Lady Washington Mining Companies, has absconded from San Francisco. He is a defaulter to the amount of $60,000, mostly from the New York Mining Company. The Belcher Company does not suffer.

The Cape Cod Exchange and Brett's block in Harwich, Cape Cod, were destroyed by fire Jan. 1. The Exchange building contained the town hall. The fire destroyed nearly all the business portion of the town. The loss is about $15,000. The fire originated by the breaking of a lamp.

Gov. Tilden, at the request of the Common Council of Albany, has consented to sit for his portrait, to be placed in the Common Council chamber of that city.

The statute of Gov. Winthrop, by Greenough, arrived a few days ago in Boston from Florence. The figure is life size, dressed in Puritan style, and mounted upon a plain pedestal. The statue will be sent to Washington as the contribution of the State of Massachusetts to the National Gallery of Art.

A large fire occurred Jan. 20, at Apollo, Penn., on the West Pennsylvania Railroad. The fire originated from the explosion of an oil lamp. Two squares, comprising about 40 buildings, were entirely destroyed. The loss is estimated at from $40,000 to $50,000.

The Board of State Prison Inspectors have made the following appointments for the Auburn Prison: Agent and Warden, Charles F. Durston of Auburn; Clerk, James D. Morgan of Penn Yan, Yates Co.; Storekeeper, Willard N. Smith of Geneva, Ontario County.

The annual report of the Secretary and Superintendent of the Boston Board of Trade refers to the lack of adequate means of communication as the only obstacle to the growth of Boston's export trade, and adverts to the need of improved terminal facilities, commending the utilization of the South Boston flats. While there has been a falling off in imports of $2,785,497, as compared with the previous year, there has been an increase of $3,130,372 in exports, and there is enough freight now offering here for England to employ many vessels.

The Fourth of July will be a very noisy day in Philadelphia. The demonstration will turn out a multitude of deaf Quakers.

A bill to abolish Tammany has been introduced into the State Senate.

The Ohio Republican State Convention has been appointed for March 29 at Columbus.

Miss Charlotte Cushman is again dangerously ill in Boston, and her condition gives serious alarm to her friends.

Wm. Harlan, only son of the Hon. James Harlan, ex-Secretary of the Interior, died in San Francisco Jan. 19. His father and mother arrived, in response to a telegram, a few hours before his death.

Mr. D. L. Moody, the evangelist, has gone to Florida for the purpose of locating his son in a milder climate. Mr. Moody will return immediately, and begin his labors in New York on the 1st of February.

FOREIGN NOTES.

THE Governor of Paris has refused permission to the workingmen to hold a public meeting for the purpose of nominating a Senatorial candidate.

London dispatches from Algiers report a terrible hurricane in Algeria Jan. 13. The destruction of property was immense, and cannot be estimated. The shipping on the coast also suffered severely. The gale was of unusual violence.

The oldest daughter of Admiral Hardy, the officer in whose arms the gallant Nelson expired, recently died in England. She was the occupant of a suite of rooms in Hampton Court Palace, alloted her by the Queen. The musket ball by which Nelson was killed was for many years kept as a memento by Capt. Hardy, who had it mounted in crystal and silver as a locket. It is believed now to be in the possession of the Queen.

The London Times of Jan. 20th has an article in its financial department on the proposition of Mr. Sherman, recently introduced in the United States Senate, for a common unit for money and accounts for the United States and Great Britain. It says that the idea, so far as it has been considered, finds no favor here. It might suit the Americans, as most of their gold is locked up in Sub-Treasuries, while the English sovereign circulates in millions throughout the world. It is believed that the disturbance arising from such a change would be indescribable, particularly in the absence of specie payments in America.

With reference to the statement made by Secretary Fish before the Committee on Foreign Affairs of the American House of Representatives respecting negotiations between Spain and the United States, it is semi-officially pointed out that the Washington Government not having yet replied to the Spanish note of the 15th of November, 1875, nor having officially communicated at Madrid the contents of the American circular note to the European powers, all reports of a favorable reply from Spain may be regarded as destitute of foundation.

Gen. Martinez Campo's army has begun moving against the Carlists in Navarre.

The London Times of Jan. 20th publishes a letter from Vienna containing the following details in regard to matters in the northern provinces of Turkey. In consequence of the Turkish operations on the Montenegrin frontier, the Prince of Montenegro summoned a war council of Senators and military officers, which resolved that if the concentration of the Turkish forces on the frontier is to take such proportions as to really carry into effect the reported plan of blockading Montenegro on that side, it will be considered a *casus belli*, and the Prince should summon all Montenegrins liable to duty to march into Herzegovina; that in the meantime Montenegro will keep an expectant attitude, and not disturb the peace if the Turkish operations develop nothing more serious than the present situation. This resolution, it seems, was chiefly taken for its moral effect on the Sublime Porte and the Montenegrins. The latter are highly dissatisfied with what they consider the undecided and timid policy of the Prince.

The returns from the Departments of Loret, Meuse, Eure, Charente, Mauche, Cher, Calvados and Pyrenees Orientales show Conservative majorities in the election for Senatorial delegates. In the Departments of Var, Cote d'Or, Tarn, Jura and Marne the results are doubtful.

At the sitting of the Permanent Committee of the Assembly at Versailles, Jan. 20, the Left complained that the Prefects were influencing the elections. M. Buffet refused to discuss the subject, alleging that he did not desire to anticipate the debate on the verification of the elections in the new Assembly. He only admitted the Committee's right to summon the present Assembly if it saw fit. He maintained the legality of his instructions to the Prefects in relation to the Press, which were to the effect that the licenses of newspaper dealers may be revoked in case legal regulations were not complied with. If the Left disapproved, they could appeal to the tribunals. The Left protested against the Minister's course, after which the matter was then dropped. M. Buffet likewise refused to make any explanation in regard to the suppression of the banquet to M. Gambetta at Marseilles, or to take notice of the reports that the Government favored a Bonapartist candidate in the Department of the Gironde.

The Alfonsists have thrown supplies of provisions and ammunition into Oyarzun, in the face of a heavy fire from the Carlist batteries.

Victor Hugo has issued an address to the Senatorial delegates for Paris and France, in which he asks them to found a Democracy which shall end foreign war by arbitration, civil war by amnesty, and distress by education.

In Victoria, the Hon. James McCulloch, in a financial statement, points out that the revenue of the colony is inadequate to meet the expenses. The Victoria journals state that an alarming increase of insanity, and destitution was noticeable in Melbourne.

The elections for members of the Cortes are proceeding in an orderly manner throughout Spain. The Epoca, in an editorial on the financial situation, urges the Ministry to reorganize the National finances on a sound basis, and restrict the public expenditures as much as possible.

The London Times favors placing American coin in simple ratio with the British standard.

M. Wallon, Minister of Public Instruction in France, has ordered the restoration of the Cathedral at Rheims, at a cost of $400,000.

Mr. Disraeli on his 70th birthday received a letter of congratulation from the Nottingham and District Workinginen's Constitutional Association.

Roderick William Cameron and Dr. R. Forbes of New York, Sir Daniel Cooper of London, and Geo. Russell of Scotland have been appointed Commissioners to the Philadephia Exhibition for New South Wales.

The London Lancet says: On Friday the Pope, after fatiguing receptions, complained of being unwell. He had an epileptoid seizure, lasting forty minutes. Since then he has been confined to his bed. Though his health requires the doctor's vigilant care, the grave reports recently circulated are groundless.

THE SEASON, CROPS, PRICES, ETC.

Shohomish City, Wash. Ter., Dec. 25.—Since the middle of October, it has rained more than half the time. Had five pretty good freshets in the Shohomish River; bottom lands inundated for the last three days. The ground has been white with snow several times, but no frost. Saw clover in blossom yesterday. Hay worth $12 now, with a prospect of higher prices. Potatoes, $1; Wheat, $1.25; oats, 62½c.; barley, 75c.; beef, by the quarter, 6@7c.; steak, 10@12c.—ARGUS.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Jan. 22, 1875.

RECEIPTS.—The receipts of Produce for the week were as follows:

Flour, bbls	80,444	Wool, bales	1,114
Whisky	1,341	Hops, bales	3,485
Corn meal, bbls	1,051	Pork, bbls	4,815
Corn meal, bags	5,753	Cut meats, pkgs	8,900
Wheat, bush	447,100	Lard, pkgs	6,850
Corn, bush	302,838	Tar, bbls	100
Oats, bush	113,016	Tobacco, cases	823
Rye, bush	781	do. crates	2,588
Malt, bush	11,074	Butter, pkgs	17,167
Barley, bush	21,522	Cheese, bxs	10,500
Beans, bbls	1,511	Cotton, bales	25,750
Grass seed, bags	4,772	Rosin	7,052
Ashes, pkgs	56	Spts. turp., bbls	1,355
Beef, pkgs	3,299	Dried Fruits, pkgs	7,017
Peas, bush	30,322	Eggs, bbls	200
Beeswax, pkgs	5	Crude Turpentine	470
Oil Cake, pkgs	12,586	N. O. Molasses, bbls.	

BEANS AND PEAS.—There is a more settled feeling in beans, but prices as yet, do not admit of any advance for the most marketable grades, mediums and marrows. Receipts have been very large, as the interior has been remarkably free from obstruction in the way of bad roads. When the stock here is less scattered, we may look for prices to harden. There is a fair export demand for marrows induced by the low rates. Pea Beans are nominal. Kidneys of all kinds have merely a retail trade. Canadian peas are a trifle better. Green peas are in large supply, and in a large way will not go above $1.50. Lima beans have no call.

We quote Beans, pea, now, prime, $1.30@1.60; other, 1.25@1.35; medium, new, $1.40@1.45; fair to good, $1.15@1.39; very poor, 50@90c.; marrow, new, prime, $1.70@1.75; other, $1.47½@1.60, white kidney, prime, $1.85@1.95; fair to good, $1.60@1.70 red kidney, new, prime, $1.57½@1.60; fair to good, $1.30@1.45; California Lima, choice, $3.60@3.90. Peas, Canadian bnls., new, duty paid, $1.25@1.27; bulk, in bond, $1.02@1.03; green, new, ₱ bush., $1.50@1.60; Southern B. E., ₱ 2 bush. bag, $3.10@3.15.

Exports of beans since Jan. 1st, 2,375 bbls.; of peas, 32,473 bush.

BEESWAX.—There is a fair export demand and a firm market. Sales at 31½@32c. for Western, and 32@33c. for Southern.

BUDOM CORN.—Prime stock scarce and wanted. We quote Brush, short green, 9½@10c.; hurl, green, 10c; green, medium, 6@7c.; red and red tipped, 4@5c.

BUCKWHEAT FLOUR.—This season's business has been very unsatisfactory, owing to the mild weather, which has had a tendency to restrict consumptive demand. Quoted $1.85@2.25.

BUTTER.—The demand for State butter is active, but without the volume usually incident to winter markets. The fact is, thus far we have had very little winter and it would seem as though consumers had reduced their wants in proportion to the mild weather. Very choice stock is firm and a few dairies claim rates above our figures. Useful market grades are pretty steady and with the present rate of receipts, prices will have temporary support. The open winter sends us a good deal of winter-made stock, nearly all of the arrivals from the West are of that quality. We have an excess of rolls, receiving some of the surplus of other cities.

State dairies entire, extra, 30@31c.; entire, good to prime, 28@29c.; fair to good, 24@26c.; firkins, selected fresh, 28@30c.; good to prime, 25@28c.; fair to good, 21@25c.; half-firkin tubs, selected, 30@32c.; good to prime, 30@32c.; fair to good, 27@30c.; poor to fair, 25@27c.; State, Welsh, tubs, fall made, 30@31c.; dairies, 27@29c.; good to prime, 25@27c.; fair to good, 24@25c.; poor to fair, 22@23c.; Pennsylvania, store packed, 17@25c.; Western, dairy tubs, selected, 36@37c.; good to prime, 21@26c.; tubs selected fresh, 24@27c.; good to prime, fresh, 23@25c.; fair to good, fresh, 21@23c.; poor to fair, fresh, 20@21c.; Western, early packed, selected, 21@22c.; Western, early packed, other, 16@20c. Roll butter, good to prime, 22@24c.; fair to good, 18@20c.

CHEESE.—The market is in better shape for the selling interest. There is a fair demand from neighboring markets, and increased trade on English account, the markets abroad being stronger. The chief sales are at 11@12½c. for good to prime, with fancy selling at 13@13½c.

New State factory, fancy, 13½@13¾c.; fine, 12½c.; do. good to prime, 11¾@12¾c.; fair to good, 10@11¾c.; poor to fair, 7@10c. State Farm Dairy—fancy, 12@12½c.; good to prime, 10¾@11½c.; fair to good, 9¾@10½c. Western factory, cheddar, fine, 12@12½c., good to prime, 11@12c.; flat fine, 12½@13c.; good to prime, 11@12c.; fair, 8@10c.; poor to fair, 7@8c.; English dairy, Connecticut, 13@13½c., do. State, 17@20c.; pineapple, 16@18c.

COTTON.—Is unsettled and lower, on account of the depressed markets abroad and heavy arrivals at the ports. Latest sales for January, 12 31-32c; February, 13 1-32c; March, 13 9-32@13 5-16c.; April, 13 5-16@13 17-32c.; May, 13 21-32@13¾c.; June, 13 29-32 5-16c.; July, 14 1-16@14⅛c.; August, 14 3-16@14¼c.

Quotations for spot cotton, based on American standard of classification:

DOMESTIC DRIED FRUITS.—Apples are dull and weak. Peaches scarce and firm. Blackberries in light stock and held at full prices. Raspberries and cherries lower.

Apples—State, sliced, 9¼@10c.; quarters, 9@—c.; Western quarters, 8¼@8¾c.; southern sliced, 1875 crop, 9¼@10c. for prime, and fancy 12c.; Tennessee qrs., 8¾@9¾c. Blackberries, new, 12½@13c. Peeled peaches, good and prime Georgia, 14@16c.; do. fancy, 18c. Unpeeled peaches, new, 12½c., for halves, 11@11½c. for quarters. Plums, 20c. Raspberries, 28@30c. Cherries, 23@23c.

EGGS.—Large receipts, a light demand and bad weather for stored stock, has had a very shattering effect upon prices. As usual, when this item begins to decline, it is hard to say where it will stop.

We quote near points, 24@25c.; State and Pennsylvania, 31@21c.; Canadian, choice, 22@23c.; Western, do., 21@23c.; other Western, 20@22c.; Southern, 20@22c.; Lamed, 20@22c.

FLOUR.—There has been no active export inquiry and prices have been well sustained, notwithstanding the yielding market on wheat.

Superfine State, $4.25@4.65; extra do., $4.90@5.90; superfine Western, $4.25@4.65; extra do., $4.90@5.90; No. 2, $3.25@4.10 extra round-hoop Ohio, $4.95@5.30 trade brands do., $5.55@7.40; white wheat extras, $5.95@7.00; St. Louis, $5.20@8.00; City Mills extra, $5.15@6.75. Southern at $4.15@4.60 for superfine; $4.80@5.30 for poor to choice shipping extras; $5.40@8.75 for trade and family brands. Rye flour at $4.10@5.85.

FRESH FRUITS.—Exports of apples since Jan. 1st, 91,000 bbls., same time last year, 3,100 do. The rough or tarnished grades of apples are pressed for sale, and prices favor buyer for small or scalded fruit. Prime is held for full prices. E. Beurre California pears are in fair demand. Cranberries are scarce and firm. Peanuts steady.

Apples.—Spitzenbergs and Baldwins, fine, $3.50@4; Greenings, $3@3.50; mixed, good, $2.50@2.75; do. fair, $2@2.25. Pears—Choice Cal., ₱ box, $4@4.50. Cranberries—Jersey, choice, bush. crates, full measure, $3@3.25; good to prime, $2.75@3; good to choice, ₱ bbl., $8.75@9.75; Cape Cod, fancy, ₱ bbl., $9.75@10.25 Eastern, fancy, $9.75@10.25; good to prime, $8.50@9.50. Nuts—Peanuts, Virginia, $1.40@1.60; do. Wilmington, $1.70@1.85; do. Tennessee, 75@90c.; Hickory nuts, $1@1.25. B. walnuts, 60c.

FURS AND SKINS.—There has been an advance abroad at Sir C. M. Lamson's late London sales. This improvement was expected here, and prices are not varied in consequence. We quote prime skins:

Bear, Northern, as to size and quality	$10 00	to	15 00
Bear, Southern and Northern yearlings	5 00	to	10 00
Beaver, Northern, per skin	3 50	to	3 50
Beaver, Western and Southern	1 50	to	2 50

Skunks, whole streaked	15	to	20
Wolf Skins, mountain, large	2 00	to	3 00
Wolf Skins, prairie, prime	75	to	1 25

GRAIN.—For wheat there have been large arrivals, and, with depressed foreign markets, prices are lower. No. 1 Minnesota $1.35 offered for parcels to arrive; prime No. 2 Milwaukee afloat is quoted $1.23 offered; do., in store, held at $1.22; $1.20@1.25 for red Western; $1.11 for No. 3 Milwaukee spring; $1.45@1.50 for white Western. Rye quoted at 95c. for No. 2 State. Canada West barley, poor quality, sold at $1. Corn is in liberal demand. Sales at 62½@63c. for new mixed; 50@51c. for unsound; do. 60@61 for yellow. Oats are very steady in price. Sales at 48@47c. for mixed Western; 47@52c. for white Western and State.

HAY AND STRAW.—The arrivals are still moderate, demand fairly active, and prices strong.

Bale hay is quoted:—Shipping, 85c.; retail qualities, $1.25@1.45; clover, 70@80c.; salt, 65@70c. Straw is quoted at $1.10@1.20 for long rye; 80@90c. for short rye; 75@85c. for oat. Exports since Jan. 1st, 1,166 bales; same time last year, 2,158.

HIGHWINES are selling at $1.10½.

HONEY continues quiet. Dealers almost despair of moving it at all when it is neglected at present rates. We quote clover comb at 18@20c.; dark do. and strained, 10@12c.

HIDES.—The market here is fairly active. The demand largely for choice grades on export account. Generally prices are held quite firm.

New York State, 10@15c.; Eastern, 10@15c.; Wisconsins, 10@15c.; Yearlings, 8@10c.; Olds, all growths, 4@6c.; Californians, 17@20c.

POULTRY AND GAME.—The supplies dressed have been light. The market is very tender. Quotations are for prime stock. Stock on the way will be apt to turn out badly, as the weather has been against killed stock of all kinds.

Turkeys, N. J., choice, 17@18c.; do. other, 14@15c.; State and Western, choice, 15@16c.; do. other, 12@13c. Chickens, N. J., 18@20c.; State, as to quality, 14@17c.; Western, 12@14c. Ducks, N. J., good to prime, 16@19c.; State, do., 15@18c.; Western, do., 15@16c. Geese, N. J., prime, 13@15c.; State, good to prime, 10@12c.; Western, do., 9@11c.; do

Fowls, Jersey, 15@16c., Western, 14@15c. Chickens, 11@11c. Roosters, 8@8c. Turkeys, Jersey, 15@18c.; Western, 15@16c. Ducks, Jersey, ₱ pair, 87c.@$1.25; Western, 55@70c.; Jersey, ₱2@2.50; Western, $1.25@1.62.

The above prices for live.

Game has run scarce; prime birds selling high. Fresh venison is in demand. A good deal of poor Canadian has been sold low; some at 3c. ₱ lb. The limit for sale of quail and grouse will be made to March 1st. Western killed venison will also have some leniency shown it.

Quail, trapped, prime, ₱ doz., $3.75@4.00; soft, $1.50@2.00. Grouse, prime, ₱ pair, $1.25@1.50; drawn, 40@75c. Partridges, choice, ₱ pair, 75c.@$1.00.; other, 50@75c. Hares, ₱ pair, 20@30c. Rabbits, ₱ pair, 20@30c. Venison, short saddles, ₱ lb., 11@14c.; long saddles 6@8c.; whole deer, 7@8c.

PROVISIONS.—The heavy arrivals of hogs at the West have led to weak prices here throughout. Quotations are for mess pork, $20.75@20.80 for spot lots, $20.80 for January and February, and $20.30 for March delliveries. Extra prime, $16; prime mess, $21.75@22. Dressed hogs at 8¾@8¾c. Boxed dry salted shoulders, 8½c. Bacon at 10½@11c., for Western long clear, 11½c. for short clear Western steam lard at 12 13-16c. for cash. January and February deliveries, 13c. for March and 13¼c. for April. Stearine at 13c. for Western. Tallow at 9@9¼c. for prime. Beef hams, $21@25. Beef, new extra mess, $12@12.50; do., plain mess $11@11.50; new tierced at $23 for prime mess. $25 for India mess. City extra India mess, $30.50@33. Old extra mess, $11.50, and $10.50 for plain mess; packet, $15.50@16.50.

SEED.—Clover is in active export demand and prices are stronger; strictly prime State quoted at 11c., and fair lots at 13¼c.

TOBACCO.—There is a much better export trade and a steady feeling as regards prices. Quotations for Kentucky leaf.

COUNTRY CHEESE MARKET.

LITTLE FALLS, N. Y., Jan. 23, 1876.

THERE is an improved feeling in the market this week, but prices remain unchanged. Farm dairy cheese is coming forward in "driblets," and is the last of the season's make. It sells at 6@8c., according to quality, with occasional lots going at 9c.

The views of holders of factory cheese being above those of buyers, the transactions are few. The prices offered for "late ends" of factories range at 9@10c., and for September and October make 11@11½c., but holders want for the latter 13@14c.

It is believed that the stocks here in the interior markets of the State or at the factories, are less than 100,000 boxes. Wyoming County has 3,500; Lewis, 5,000 to 6,000; Cattaraugus and Erie, 25,000; Oneida, 5,000; Chemango, 1,000; there is but little in Herkimer.

The shipments from Little Falls during the year of butter and cheese have been from January 1 to December 31, as follows:—1,666 packages of butter, weighing 102,506 pounds, and 90,978 boxes of cheese weighing, in the aggregate, 5,519,561 pounds. This, it must be remembered, is only a small part of the butter and cheese sold at the Little Falls market during the year, the shipments being made at different points along the line of the railroad most convenient to the factories.

The trade in butter now at this market is mostly confined to winter make, which brings 20@25c., according to quality. Grass butter is scarce and sells for 32@35c.

We have advices from Europe up to the first week in January. Our London correspondent says:

The present season, so far, has been an unprofitable one to all except retailers; competition and large make forced it down to a point stimulating consumption, so that we may look for a good spring trade, with more profitable results. Quotations as follows:

American extra, 65@68s.; fine, 62@64s.; good, 54@58s.; secondary, 30@40s. The other descriptions of cheese sold as below:—English cheddar, 81@94s.; Wiltshire double, 72@80s.; Cheshire fine, 76@84s. Dutch cheese —Edams, 70@74s. ₱ cwt.

Notwithstanding the large trade in substitutes for butter, the best descriptions of genuine butter closed at very high rates. We give quotations:

Clonmels, 118@150s.; Corks, —s.; Dorsets, 160s.; Normandy, 100@108s.; Swedish, 105s.; American and Canadian, 90@120s., ₱ cwt.

Oleomargarine or artificial butter brings 86@110s. ₱ cwt.

LIVE STOCK MARKETS.

NEW YORK, Jan. 22, 1876.

RECEIPTS OF LIVE STOCK.

	Beeves.	Cows.	Calves.	Sheep & Lambs.	Hogs.

PERSONAL ITEMS.

HENRY BERGH has written a play.

THE Hon. Caleb Cushing was 76 years old on the 17th inst.

THE Hon. J. L. Robinson, Treasurer of Quebec, has resigned.

MR. H. WATTERSON of Louisville, Ky., who has been ill, is better.

BARON ROTHSCHILD has had an interview with Secretary Bristow.

LORD NAPIER of Magdala has been appointed Governor of Gibraltar.

DAVID D. FIELD says the Tweed prosecutors can never get a struck jury.

MME. A. GODDARD will begin her tour at Burlington, Vt., on Tuesday.

MRS. SCOTT-SIDDONS read at Steinway Hall last week with her customary success.

THE Hon. Reverdy Johnson arrived in N. Y. City from Liverpool on the 19th inst.

THE Rev. Dr. Lorrimer has decided to continue as pastor of Tremont Temple, Boston.

THE late census reports Sarah Hicks of Brooklyn as being the oldest woman in the State. Age, 114.

THE equestrian statue of Gen. McPherson, now being modeled in Cincinnati by Prof. Ribesso, is nearly finished.

SIGNOR BRIGNOLI, who is to sing with Mlle Titiens, has reached this city from Europe and is at the Everett House.

Mr. FROUDE is mentioned as a candidate for the honorary title of Chancellor of the University of Cape Town, Africa.

THOMAS HUGHES, M. P., states with regret that he cannot act as umpire for the American University Regatta of 1876.

THE widow of ex-President Johnson died at her daughter's residence, near Greenville, Tenn., Saturday night, Jan. 15.

L. D. MYERS of Columbus, O., and W. D. Brichell of Pittsburgh, Pa., have bought the Columbus Daily Dispatch for $30,000.

THE expenditures of the State of Massachusetts in connection with the funeral of Vice-President Wilson amounted to $5,322.23.

MR. EDWARD JARVIS succeeds the late Dr. Howe as Superintendent of the Massachusetts School for Idiotic and Feeble-Minded Youth.

M. VICTOR HUGO is about to publish a volume of verse entitled "Les Justes Colnes," and a prose volume, "L'Art d'Etre Grand-Pere."

THE Hon. George D. Lamont, a Justice of the N. Y. Supreme Court, died at Lockport on Saturday morning, Jan. 15, from heart disease.

AN anonymous benefactor has given $50,000 to the School of Art in Birmingham, Eng., with a view to enlarging its sphere of usefulness.

GOV. HARTRANFT has reappointed and the Senate has confirmed Mr. M. S. Quay to be Secretary of the Commonwealth of Pennsylvania.

COUNT DE POURTALES, Third Secretary of the French Legation in Washington, has been married in London to Miss Beecher of New York.

AT the Church Convention in Philadelphia addresses were delivered by Messrs. Moody and Sankey, and Drs. Hall, Vincent and Tyng, Jr.

PRESIDENT VAN RENSSELAER of Hobart College, at Geneva, has established at his own expense a reading-room for the use of the students.

PROF. RICHARDS of Yale College, who has been suffering from an ailment of the spine for some years, has gone South to spend the winter.

THE granddaughters of Mr. Seth P. Staples, the founder of the Yale Law School, have presented that institution with a portrait of their grandfather.

ROBERT DALE OWEN is now in the enjoyment of better health than he has experienced since 1871. His late unfortunate illness was superinduced by overwork.

JOHN HATCH of California has collected between 12,000 and 15,000 specimens of precious ores in various parts of the world, and will exhibit them at the Centennial.

PROF. BOWEN, Lecturer on Philosophical Subjects at Harvard College, has resigned his position as Trustee of Phillips Academy, at Exeter, which he has held for 22 years.

Mr. G. L. FOX, the great "Humpty Dumpty," is still in the asylum at Somerville, Mass., and has somewhat improved. He has rational intervals, but his recovery is considered doubtful.

THE Rev. Morley Punshon, as the representative of the Wesleyan denomination, received recently the gift of a chapel built by two gentlemen at Ivybridge, Eng., and costing about $40,000.

CURIOUSLY enough, Jefferson Davis, ex-President of the defunct Confederacy, and U. S. Grant, President of the United States, have both ordered a bill of shoes from the same firm in New Haven, Conn.

THE Rev. Dr. John Hall objects to having the Fifth Avenue Presbyterian Church designated as Dr. Hall's Church. He tells his people, "It is yours and your children's, or rather, it is Christ's, the Lord's."

H. C. KIBBE, Secretary of the Belcher, Jackson and New York Consolidated Mining Company, has absconded from San Francisco, Cal., with $60,000 belonging to the two last-named companies. He is supposed to have come East.

THE eldest daughter of Zachary Taylor, Mrs. Gen. B. C. Wood, died lately in Frieburg, Germany. The other living children of the ex-President are a daughter in Winchester, Va., and Gen. Richard Taylor of Louisiana, who was a Confederate officer.

Stock and Poultry.

IMPORTANT TO BREEDERS OF DEVON CATTLE.
Dorsetshire, England—Toller Fratrum Farm—9 Miles from Dorchester.

Mr. T. EVSON has been favored with instructions, from the Executors of the late Mr. E. Whittle, to sell by Auction, on TUESDAY, February 15th, 1876, the celebrated Herd of Devon Cattle (which has been established on the Farm by the late Mr. Whittle and his ancestors for nearly 100 years). It now consists of 235 Cows, Heifers and Bulls, descended from the most noted Herds in Devonshire. For numbers, size, quality, color, coat, symmetry, constitution and milking, this Herd is unrivaled in the Kingdom.

Catalogues may be obtained 14 days before the sale, of the Auctioneer, 54 South St., Dorchester, or at the "Mark Lane Express" Office, 26 Strand, London.

Dairy Farm to Rent.
One of the best Dairy and Stock-Breeding Farms in the State will be rented to satisfactory party on the 1st of April next. It is situated on the east bank of the Hudson, about 1¼ miles from Albany; contains 130 acres all in a high state of fertility, excellent spring water in barnyard and pasture, has cottage, 3 barns and cow stable with 50 stalls, and is well adapted to selling purposes. Address A. B. K., P. O. Box No. 186, Albany, N. Y.

Dairy Salt.

THE AMERICAN DAIRY SALT COMPANY
J. W. BARKER, Pres't and Sec'y. THOMAS MOLLOY, Treasurer.
General Office, No. 1 Clinton Block, Syracuse, N.Y.
Sole Manufacturers of the Celebrated Onondaga Factory Filled
DAIRY AND TABLE SALT.
Respectfully call the attention of Dairymen and others to the quality of Salt now being manufactured by them.

Having for many years past been engaged in perfecting the various processes for the manufacture of this salt, and by adopting the best modes and machinery for the purpose, they feel warranted in saying to the consumer that the article now produced is superior to any other, either of foreign or domestic production. The following is an analysis of our salt and the Ashton, made in April, 1875, by Messrs. Waitz and Stillman, Chemists, of New York, under the direction of a Committee of the Butter and Cheese Exchange of New York, the samples being selected by the Committee from lots found on sale in market:

	Ashton.	Onondaga.
Water	0.7859	0.6280
Insoluble Matter	0.0564	0.0364
Sulphate of Lime	1.2272	0.7217
Sulphate of Magnesia	0.0769	.....
Chloride of Calcium	.....	0.0473
Chloride of Magnesium	0.0591	0.0346
Chloride of Sodium	97.7953	98.5243
	99.9674	99.9822

Circulars in regard to the various other tests made with this salt in comparison with the best foreign article, also certificates from a large number of the best dairies in the State as to its quality, may be had on application to J. W. BARKER, Secretary, Syracuse, N. Y., to whom orders for salt may also be addressed. It is also for sale by the Agents of the Company in principal Western Lake Ports; by ST. JOHN & AVERY, 101 and 105 Broad St., New York; ROBERT GEER, 109 Pier, Albany, N. Y.; E. W. PECK & Co., Burlington, Vt., and by dealers generally throughout the State of New York.

Inquire for ONONDAGA FACTORY FILLED SALT.
J. W. BARKER, Pres't and Sec'y.

NEWS CONDENSER.

— The ice men are despondent.

— Boston is gloating over the possession of ice.

— Philadelphia has 35,239 pupils in its public schools.

— Where were the tramps before their present incarnation?

— At Montgomery, Ala., sweet potatoes sell for 80 cents a bushel.

— Washington Territory gained 5,000 new inhabitants last year by emigration.

— The Pullman car-repair shop, Jersey City, was damaged $2,500 by fire, Jan. 19.

— There are 694 cotton mills in the Northern States, and 181 in the Southern States.

— The Spring Hill strike, near Halifax, has ended and the miners have resumed work.

— The Police at Worcester, Mass., are killing all unlicensed dogs in that city with strychnine.

— The mill operatives in Macclesfield, England, have returned to work on their employers' terms.

— Extensive salt mines have been discovered in Holstein, the Brandenburg Mark, and Mecklenberg.

— The Board of Education of New York City has determined to take no part in the Centennial Exposition.

— A Society for the Protection of Animals has been formed at Copenhagen with the Crown Prince as President.

— A great revival is in progress at Montgomery, Orange Co., N. Y. Business is suspended during the meetings.

— An intercollegiate contest in oratory between the different colleges in the State of Virginia is being talked of.

— It is reported that six new locomotives are to be put on the Hudson River Railroad for next summer's travel.

— The trustees of the Cooper Union report the current assets to be $25,149.67, and the current indebtedness $22,395.76.

— A new steamboat 124 feet long is building at Owego. It will cost over $8,000. It will be called the Lyman Tremain.

— The railway ticket agents are unwilling to promise more than a 25 per cent. reduction in the Centennial's interest.

— The keel of a new tugboat which was recently laid in San Francisco, was composed of one stick of timber 140 feet long.

— The school population of Cincinnati, between the ages of 6 and 21, numbers 83,842. About 50 per cent. attend school.

— A vein of silver ore struck a short time ago in the Bay City tunnel, Alta, Utah, is said to assay from $2,000 to $4,000 per ton.

— The new Rensselaer mill, Troy, which has been idle for the past two months, started up again Jan. 17th, with 200 men.

— Five hundred and fifteen packages will be shipped from Cadiz on the 31st inst. for the Centennial Exhibition at Philadelphia.

— The Albany and Troy curling clubs played for the medal of the Grand National Curling Club of America, Jan. 13. Albany won, 127 to 79.

— The German Federal Council has been authorized to purchase Kroll's Garden, in Berlin, as the site of the new Imperial Parliament buildings.

— The directors of the Philadelphia School of Design have decided to issue a certain annual number of free scholarships to that institution.

— Harvard College received subscriptions and gifts amounting to $214,800 during the year 1875. The total amount of funds Aug. 31, 1875, was $3,139,217.

— The population of Louisiana is 855,039, an increase of 127,124 since 1870. Of the population, 404,657 are white, 450,611 colored and 1,512 Indian or Chinese.

— The temperance reform movement is making unusual progress in Maine. Large meetings are everywhere being held, while the liquor law is vigorously enforced.

— There are in Illinois, according to a late report of the Board of Education, fifty-four colleges for males, six for females, and thirty-five academies and seminaries.

— Cincinnati is organizing a battery of artillery whose members are going to the Centennial 156 strong, provided they can secure free transportation, and they think they can.

— In the Rev. Mr. Snively's Grace Church in Brooklyn, Jan. 16, a collection amounting to $12,300 was taken in aid of the domestic missions. Mr. Benson gave a $7,000 check.

— The University of Cincinnati received during the year 1875, $119,748.92, and expended during the same time $108,806.84. The endowment funds of the institution amount to $125,935.78.

— The Illinois State Industrial University has raised the amount apportioned to it as its quota of the $10,000 for the State, to be used in exhibiting its educational work at the Centennial.

— The Baptists of Tennessee propose to celebrate the Centennial year by raising $300,000 for the Baptist University recently located at Jackson. The city has already subscribed $150,000.

— Contractor McAndrews of the new Delaware, Lackawanna & Western tunnel in Bergen Hill, has broken through the last heading, and daylight was admitted into the dark cavern, Jan. 19.

— A committee of the directors of the California Rifle Association has been appointed to report a plan for a contest among California marksmen for the purpose of selecting a team to send to Philadelphia next summer.

Sewing Machines.

"GENERAL FAVORITE"

No. 2,

Recently perfected and offered to the trade by the

WEED SEWING MACHINE COMPANY,

Possess many advantages, both in construction and capacity, over machines now in use by

MANUFACTURERS.

The Machines made by this Company have always been noted for simplicity, a merit which has been preserved in this new style and combined with great strength, especial care having been taken to provide against the wear and tear of use in Factories running by

STEAM POWER.

Actual WORK is the only test of a sewing machine. The Weed Co., desirous of thorough investigation, are prepared to place these machines on trial, feeling confident that practical work will convince intending purchasers of their merit. Manufacturers will please examine if our claims are not correctly made on the following points:

CONVENIENCE.

The large space under the arm. From needle to foot of arm, 9 inches; from needle to bend of arm, 11 inches; from bed to bottom of arm, 5 inches. Easily oiled, threaded and cleaned.

SIMPLICITY.

No cams or cogs are used, a continuous circular motion, preventing vibration, and rendering a high rate of speed possible, while noise is reduced to the minimum, and for foot power the ease of working is increased to a wonderful degree.

DURABILITY.

The wearing parts are forged and hardened. Lost motion can be taken up with a screw-driver, thus saving cost of new parts, and time consumed in fitting them. The shuttle being carried, instead of driven, wears much longer, and skipping of stitches is avoided. The needle socket is hardened and so constructed that a needle, when broken in the bar, can be readily removed. Address

WEED SEWING MACHINE COMPANY,
HARTFORD, CONN.

Agents Wanted.

Wit and Humor.

SPARKS AND SPLINTERS.

Never forgotten—Debtors.

What animal is suggestive of heavy rain? The fox—He is well known as Reynard.

Mrs. Van Slycke says she hopes the silver service bill will pass—whatever it is.

Considerably taken down—The boy that was caught up in a neighbor's apple tree.

Are your words of more weight when you propound anything than when you announce it.

The latest India notion is the preparation of a British atlas to put Wales in the Indian Ocean.

Swindler is the suggestive name of the principal contractor for the great canal in Colorado.

Why is it vulgar to use a wooden platter for the loaf? Why, of course, because it is underbred.

"It's a lovely doll, dear grandpa and grandma; but—but—I'd been hoping it would be twins."

The fellow who asked the policeman "What are you givin' us?" found out when the policeman knocked him down with his club.

Ah Sing and Ah Sin have been at law in San Francisco about the sale of a wife. The matter has been referred to Ah Bitration.

"Pa, do storms ever make malt liquors?" "No, child; why do you ask?" "Becaus I heard ma tell Jane to bring in the clothes, for a storm was brewing."

A New Hampshire man sends fourteen of his children to one school, and when they combine against the teacher he knows that he can safely bet upon the result.

After the clergyman had united a happy pair not long ago, an awful silence ensued, which was broken by an impatient youth exclaiming, "Don't be so unspeakably happy."

A Scotchman asked an Irishman, "Why were half farthings coined in England?" Pat's answer was, "To give Scotchmen an opportunity of subscribing to charitable institutions."

"Say," said a city youth to a modest countryman, "got the hay seed out of your hair yet?" "Wall," was the deliberate reply, "I jedge not from the way the calves run arter me."

"Sorr, av ye plase, whist now, while of ax ye whin is the bist month to tell a lie in?" "Ye give it up, ye do?" "Arrah, now, if ye want the bist month for a lie, what ud it be but Febr-uary?"

It has been discovered that the same kind of coloring matter which poisons the striped stockings is also used to color the bad whisky. In both cases it goes to the legs and ruins the understanding.

"John Henry," said his wife, with stony severity, "I saw you coming out of a saloon this afternoon." "Well, madam," replied the obdurate John, "you wouldn't have me stay in there, would you?"

It is said that since his release from confinement, Brigham Young acts as a changed man. It is only necessary for one of his wives to hint that the fire is low, and he will trot out to the woodshed as if he was thankful for the exercise.

Blaine and Cox are good friends. After Cox had saluted the gentleman from Maine the other day with "Bellow away then—you are a hynea!" they met in the cloak-room, and drew cuts to see which should call the other the dynamite fiend.

An Irishman recently handed into the telegraph office a despatch intended to inform another Emeralder, employed upon the public works in a neighboring town of the decease of a friend. It read thus:—"Barney, come home, I died last night."

The dedication hymn to Vanderbilt's university ends thus:

"Patrons and benefactors bless—
To teachers, students, give success;
We pray in faith, assured thou wilt
Shine forth upon our Vanderbilt."

This sort of thing is depressing, and tends to discourage all donations to colleges.

Smith (addressing his friend Jones, who is an inveterate stammerer)—Say, Jones, I've started out on a new line of buisness. Jones—Wh-what l-l-line friend Smi-smi-smith? Smith—Well, I've gone into the philanthropist business. Jones—Phi--phi-philan-lan-thropist? Smith—Yes, doing good to everybody. You never learned a trade, did you? Jones—No, Smi-smith, un-un-fort-fort-nately, I nev-never did. Smith—Well, Jones, I've thought of something for you. Jones—Do-de-dear Smi-smith! Smith—Yes, Jones, I have. Do you not know that you have been born with a natural gift for a well-paying trade? Jones—Is it pos-possi-possible? Smith—Yes, Jones, you would make a splendid auctioneer. Jones—A knock-a knock-a knockticneer! Smith—Yes you can say "go-go-go-going-gone!" so beautifully. Smith is now in hospital. His ante-mortem has been taken, and Jones is in jail awaiting the result of Smith's injuries.

HALF MEASURES.

"What, not got any lamb?" "No, m'm." "Nor any mutton?" "No, m'm. Mr. Butcher, he only kills once a week, and then only half a sheep at a time, m'm!"

The following Catalogues are annually published, and will be mailed to all applicants on receipt of price affixed.

Bliss's Illustrated Seed Catalogue and Amateur's Guide to the Flower and Kitchen Garden.—200 pages, including several hundred finely executed engravings and a **beautifully colored lithograph. 35 cts.** An edition elegantly bound in cloth, $1.

Bliss's Gardener's Almanac and Abridged Catalogue,—122 pages. Embraces a monthly calendar of operations, and a price list of all the leading **Garden, Field and Flower Seeds**, with directions for their culture. **10 cts.**

(CIRCULAR.

Consumers Importing Tea Co.,
No. 8 Church Street.
P. O. Box 5,509. New York City.

This is a combination of capitalists to supply the consumers of Teas throughout the United States on the mutual principle.

We have experienced agents in all the best districts of China and Japan to select Teas especially for our trade.

We expect every consumer of Teas to render us all the assistance they can in carrying out our enterprise, as we make a specialty of SUPPLYING CONSUMERS ONLY (and allow no middlemen to make any profit on our importations), which will enable us to supply them with Teas at prices lower than have ever been known, and of those fine qualities that seldom reach the interior, being sold only to the large cities and among the very wealthy.

Hoping the consumer will take an interest in our enterprise, and send at once for a circular with full explanations of how to proceed to obtain our goods, we remain,

Most respectfully yours,
Consumers Importing Tea Co.,
No. 8 Church St.,
P. O. Box 5,509. New York City.

Entered, according to Act of Congress, in January, 1874, by the Consumers Importing Tea Co., in the Office of the Librarian of Congress, Washington, D.C.

WHITMAN & BURRELL,
Little Falls, N. Y.

I have founded my business on the belief that the public are anxious to get their seed *directly from the grower*, and I therefore offer FREE to every man and woman in the United States who cultivates a farm, tills a vegetable garden, or plants a flower garden, my large, Illustrated Catalogue of Vegetable and Flower Seeds for 1876; it contains, in addition to the choicest kinds produced in Europe, *one hundred and fifty varieties of vegetable seed grown on my four seed farms.* Customers of last season need not write for it. As the original introducer of the Hubbard, Marblehead and Butman Squashes, Phinney's Melon, the Marblehead Cabbages, and a score of other new vegetables, I solicit your patronage. All seed sold under three warrants. A hundred thousand Catalogues will be issued and sent out on the first of January.

[Entered according to Act of Congress, in the year 1876, by the Rural Publishing Company, in the office of the Librarian of Congress at Washington.]

The Centennial.

HORTICULTURAL HALL.

If American Independence had been declared in 1676, its Centennial Celebration one hundred years ago would have called for very little jubilation over Horticultural progress. Most of our acchievements in Fruit Growing, Gardening and Floriculture date far within the last half of our century's history as an independent people. To-day these departments of our country's progress are not the least astonishing, and to many thousands will be the most interesting portion of the Exposition, showing our growth and civilization.

Horticultural Hall, as shown in the engraving, is an imposing structure, with a length of 383 feet, and width of main building 193 ft. Its hight is 72 ft. to the skylight. The Centennial Conservatory, 230x80 ft. and 55 ft. high, occupies the main floor, and in this the main exhibition will be made. Twenty ft. from the floor a gallery runs around it. On the north and south sides of the principal room will be the forcing and propagating houses, each 100x30 ft., covered with a curved roof of glass and iron. Similar vestibules occupy the east and west ends, and by the side of these are rooms for offices, etc. Ornamented stairways lead to the interior and exterior galleries of the conservatories. These latter are 10 ft. wide. The entrances, at the east and west ends, will be approached by flights of blue marble steps. The basement is fire-proof and used for store-houses, cool room, kitchen and heating apartments.

The entire building will be mainly of iron and glass, and is intended to remain after the Exposition as an ornament to Fairmount Park and a patriotic memorial of our first Centennial Celebration of Horticultural Progress.

NEW YORK AT THE EXPOSITION.

It will gratify all friends of the Centennial Exposition to know, what we learn from correspondence of the Tribune, that the Empire State is to be well represented—not indeed in a separate department, but contributing its proportionate quota toward the whole. We understand that, to prevent confusion, like articles from different States will be grouped together, the localities from which they come will be plainly indicated, and each locality allotted sufficient space.

The New York State Centennial Commission is composed of the following gentlemen: Frank Leslie, President; John Murdoch, Alonzo B. Cornell, Felix Campbell, and Jackson S. Schultz, Commissioners, and Thomas McElrath, Secretary. These gentlemen have been actively at work only for a few months.

The total number of entries from this State is about 1,500. Something over 350 of these were made at the headquarters of the State Board in New York City. The rest were made at Philadelphia, and memoranda of them have been forwarded to New York City for record. The variety of articles to be shown is bewildering, and the magnificence of the display to be made by some of the firms who have decided to go into the Fair is surprising. The big leather-covered folio book of entries at the Centennial Headquarters on Broadway reads like a catalogue of American inventions. Among the miscellaneous articles nearly everything is to be exhibited that can be thought of, in size from a copper war token to a steam road-roller, and in beauty and value from a fan breastpin to the noblest of paintings owned this side of the Atlantic.

An important part of the contribution coming from this State will be in the line of mowers and reapers, farm implements and machinery. In the general exhibit of this class of manufactures several hundred firms in this State will be represented. It is believed that very few, if any, of the large factories, whose products in any way constitute a feature of the industries of New York, will not send to Philadelphia.

NOTES ABOUT THE CENTENNIAL.

A Parisian has obtained permission to put up a building in which models of Paris and Jerusalem are to be exhibited.

The West Virginia Pavilion will be near the British buildings, and will be constructed wholly of timber brought from that State.

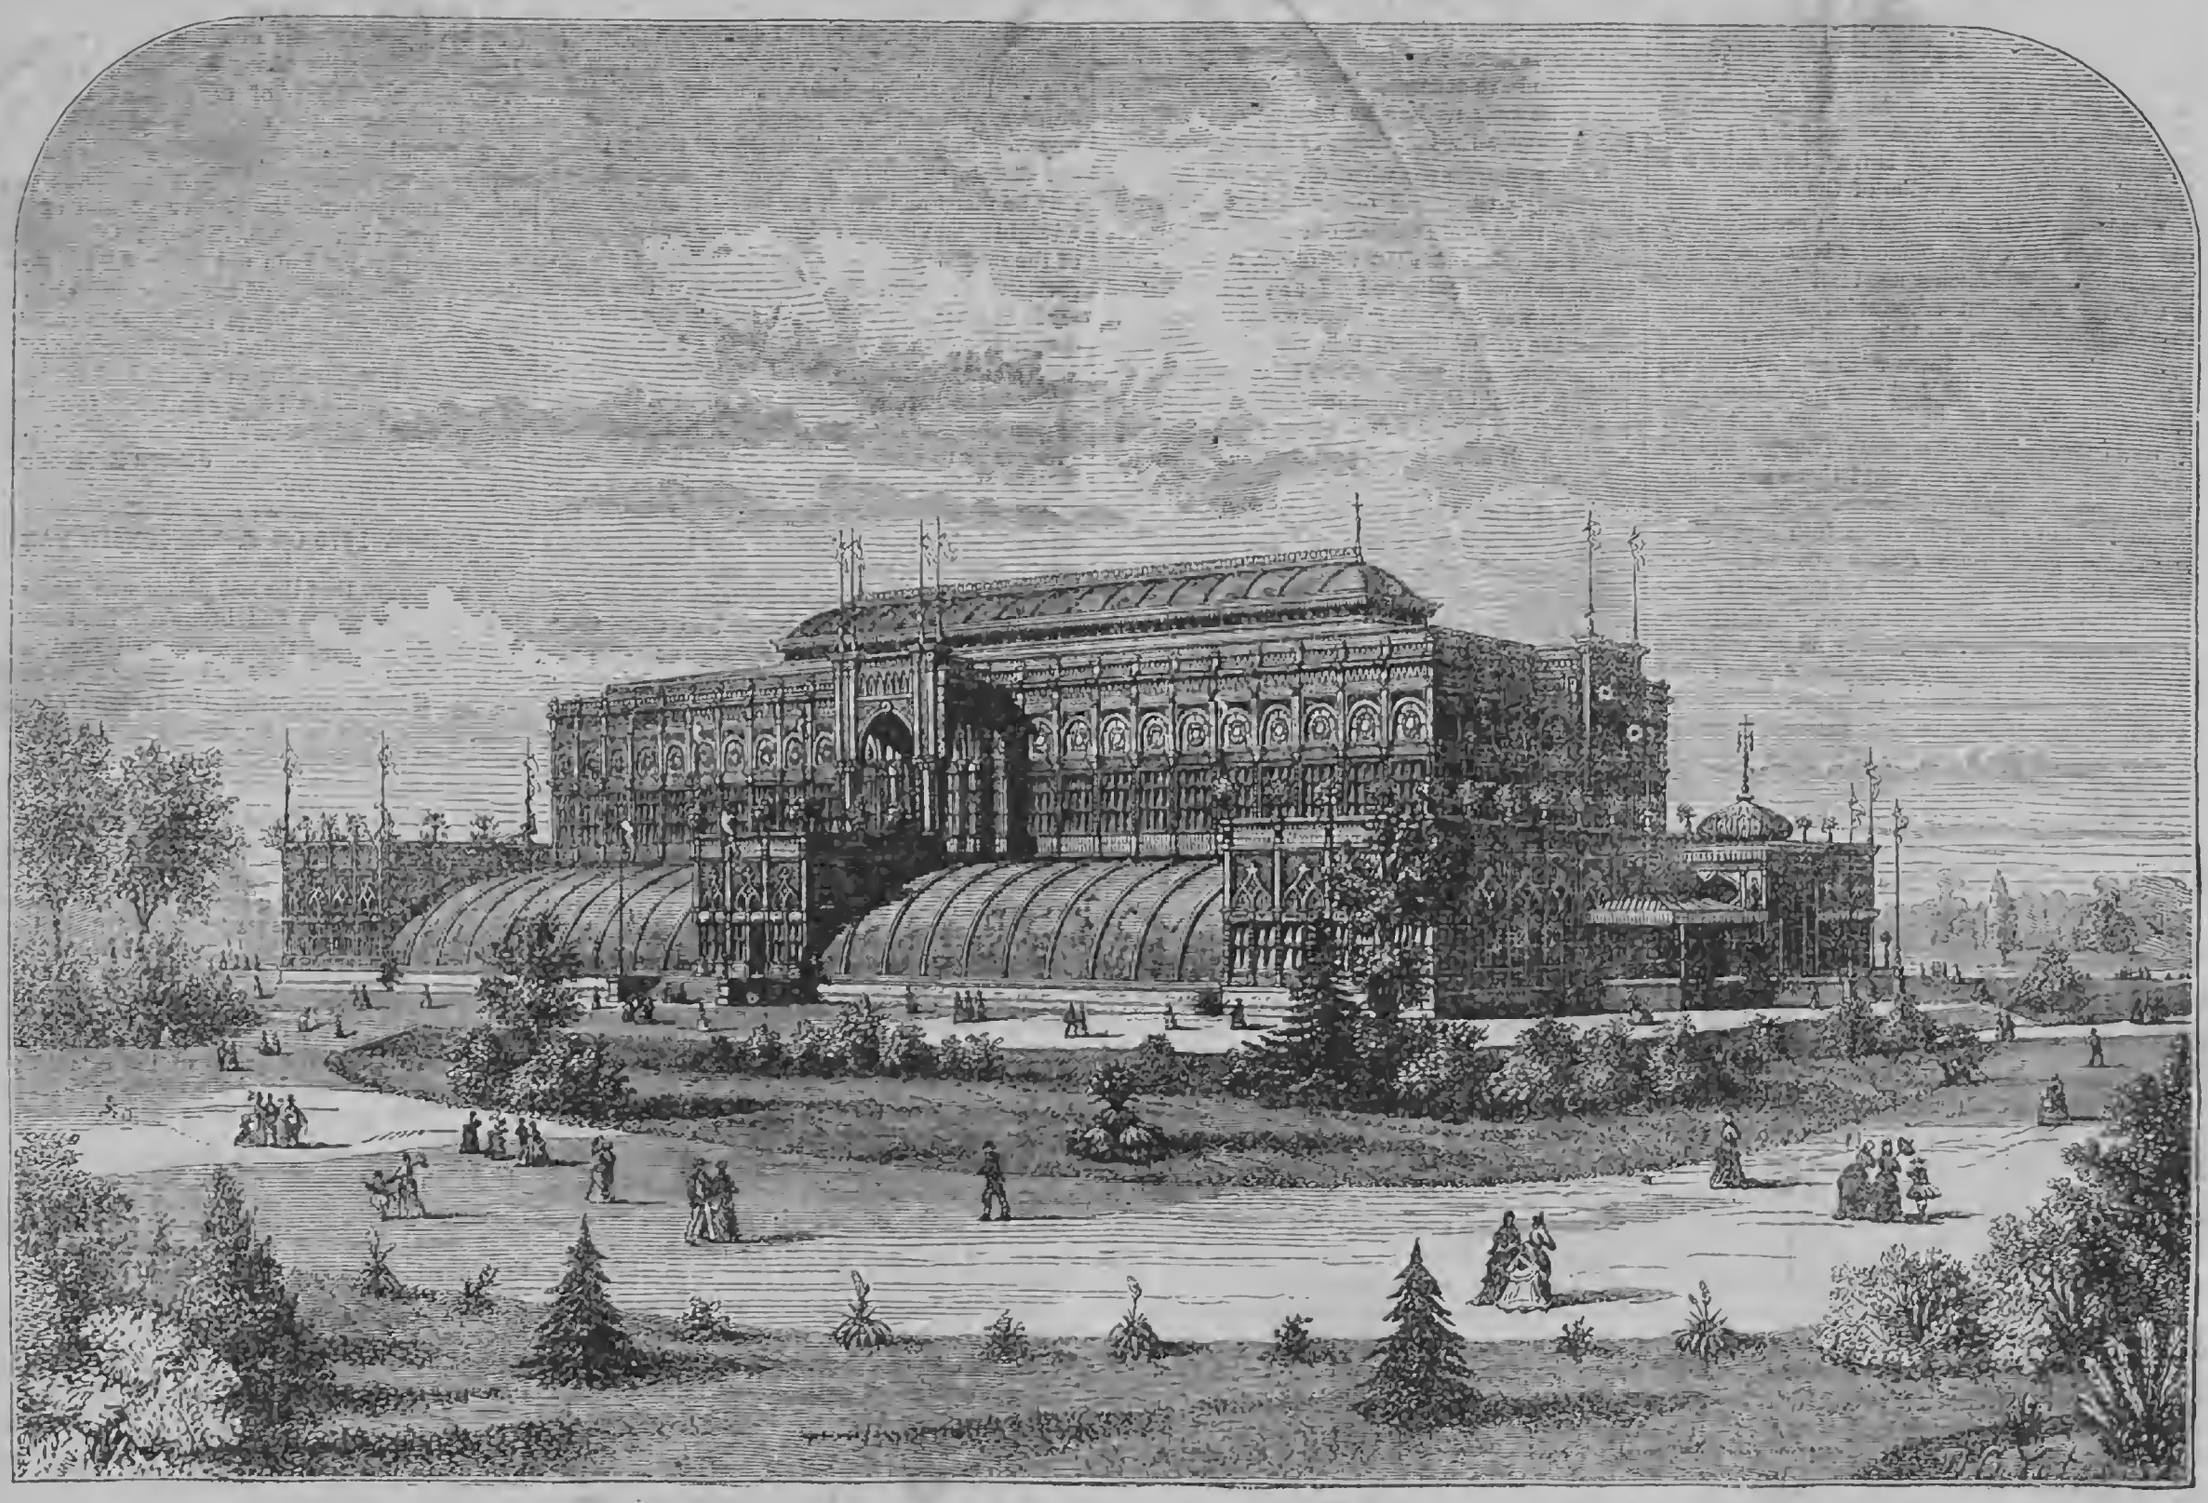
A signal and weather station will be erected on the grounds by the Signal Bureau. There will also be a block house in the rear of Machinery Hall to illustrate frontier warfare.

An afternoon edition of the Philadelphia Times will be printed in Machinery Hall during the Exhibition on one of Col. Hoe's new presses. The Times will also build an office on the grounds.

The minerals for the Government exhibit to be made under the supervision of the Smithsonian Institution have arrived in Philadelphia, and are being classified and arranged by Prof. W. P. Blake of New Haven.

A concession for a banking office on the grounds has been granted to the Centennial National Bank, a corporation just organized. Its President is E. A. Rollins, formerly United States Commissioner of Internal Revenue.

In Machinery Hall square feet of space have been allotted to foreign countries as follows: Great Britain, 37,125; Germany, 10,757; France,



HORTICULTURAL HALL, CENTENNIAL GROUNDS, PHILADELPHIA.

10,139; Belgium, 9,375; Canada, 4,300; Brazil, 4,000; Sweden, 3,168; Spain, 2,448; Russia, 1,500, and Austria, 1,536.

THE Main Exhibition Building will be finished about the middle of February. Little remains to be done except the interior decoration and the floor-laying, and both are well advanced. According to the contract, the builder, Mr. Dobbins, forfeits $300 for every day the work is prolonged after the 1st of January, but the Board of Finance will probably not exact the penalty.

THE United States Government building, a cruciform structure with a large glass dome, is now completed, and the portions to be occupied by the different departments are indicated by the decorations on the adjacent walls. Where plows abound as mural ornaments the Agricultural Department will naturally be found, anchors point out the location of the Navy, swords of the War Department, and so on.

THE Michigan building will be begun in the Park next week. The whole structure, except the foundation, will be finished in Michigan. The New Jersey building is nearly finished and makes a handsome appearance. Pennsylvania will have the largest of all the State buildings if the Legislature appropriates the $15,000 which it is asked to give for the purpose. The plans have been made and taken to Harrisburg. Ohio's headquarters have got as far along as the foundation.

Field Crops.

CLOVER AND TIMOTHY.

THE common practice of many farmers in sowing Clover and Timothy seed together is objected to because they are not ripe and ready to cut at the same time. F. R. ELLIOTT advises to sow Corn with Orchard Grass, as the two are better suited to each other for hay. Without saying anything against this recommendation, the growing of Clover and Timothy on the same soil has some good arguments in its favor.

First, we premise that Clover is, or should be, in nearly every case, the important crop, and wherever Timothy is grown it should be entirely a secondary consideration. There are only enough exceptions to this to establish its validity as a general rule. Considering that we are aiming at mostly Clover, there are very good reasons for adding a little Timothy. If the aim were otherwise—to make Timothy the main crop, as may sometimes be advisable on rich river bottoms, where hay is grown for sale—the addition of even a small amount of Clover would be a decided disadvantage. To bring the highest price in most markets, Timothy Hay ought to be as pure as possible. Clover in a field of Timothy grown for market is simply a weed—a useful and beneficial weed for the soil, it is true, but none the less detrimental to the value of the crop.

When Clover is made the main seeding crop, the addition of a little Timothy is not at all objectionable. The farmer need not delay cutting his Clover a day on account of the Timothy. Cut the Clover when the blossoms begin to open, just the same as if there were nothing else on the field, as in point of fact with a good catch of Clover there will be little else the first year. Early in the season the young Timothy will be small and immature, but what there is will dry much more rapidly than the coarser-stalked Clover and aid in curing the whole into hay. Farmers who grow pure Clover are every year plagued by large quantities heating and sometimes rotting in stacks and mows, despite every care in curing. A little Timothy mixed with the Clover quickly becomes thoroughly dry and aids in absorbing superfluous moisture. Farmers who have dry straw can use it between layers of Clover hay in the mow for the same purpose, and with excellent effect.

If Timothy is sown in the spring with Clover seed, it will not the first or second seasons interfere in the least with the Clover. The farmer will get just as much Clover as if there were no Timothy, and the additional grass will be so much clear gain. If the field is to be plowed the second season, the Clover will have benefited the soil just as much as if it alone occupied the soil. The Timothy grass and roots only occupy spaces that would otherwise have been vacant or filled with weeds. If, however, the Timothy was sown the fall previous to sowing Clover seed, there is danger that it will occupy the land and less Clover will catch. In all cases where a crop of Clover is desired, six quarts or a peck of Clover seed should be sown, and the Timothy seed, whatever the amount, be put in extra.

If for any reason the field cannot be plowed after the first Clover crop has been taken off, the Timothy will then come forward and occupy the land. Sometimes in very dry seasons the Clover catch fails entirely, and then it is important that land seeded one or two years before should be kept in grass, and then the Timothy with Clover comes in good play. Clover is a biennial, dying out after the second year, unless under very exceptional circumstances. Timothy may not be a profitable grass for farmers with arable land, but it is a great deal better than nothing. It is also better for fields soon to be plowed than blue-grass, which will inevitably gradually creep in where dying Clover has found no better heir to fill its place. Hence we advise farmers, when sowing Clover this spring, to add a little Timothy, unless they are quite certain that the Clover is to be plowed under the year following. Even then it will do no hurt.

POTATOES MIXING IN THE HILL.

WE had supposed that this question of whether potatoes ever do become mixed by either growing in the same field or hill had long ago been settled in the negative. Of course we know that there are farmers who still adhere to their *settled* belief that potatoes do frequently mix in the hill and wheat turn to chess; but it is seldom now-a-days that a man of intelligence who has given these subjects careful consideration and examination will stand up and declare his faith in either.

But it seems to be very difficult to eradicate prejudice or the influence of early training out of the human cranium, and although few may believe in lucky signs, still they had a little rather see the new moon over their right shoulder than over the left. In no other way can we account for the appearance of a late article in the Country Gentleman by Mr. CHAS. ARNOLD of Ontario, Canada, on this subject of potatoes mixing in the hill. Mr. ARNOLD is widely known as a scientific horticulturist, being one of the few men who have been successful in raising hybrid grapes and raspberries, still he seems to be inclined to take the affirmative side of the potato-mixing theory. In fact, he says:

"But still I shall choose the affirmative side of the question, and assert positively that potatoes do become changed entirely in the hill into quite distinct potatoes from those that were planted.

"The fact is, Nature has more and greater facilities for producing new varieties in the vegetable kingdom than she generally gets credit for. We are all too apt to overlook the fact that the whole vegetable world is capable of producing new and valuable varieties by bud hybrids, or sports, or whatever else they may be called. Of the conditions favorable for producing new varieties in this way but little is known, but that new and valuable fruits, flowers and vegetables are produced is, I believe, admitted by all. And no doubt thousands of valuable variations thus produced pass into oblivion unobserved. They are 'born to blush unseen.'"

After referring to some other similar freaks known to have occurred among various kinds of fruits, he tells us how he became converted to the mixing-in-the-hill theory, as follows:

"Four years ago, when digging my favorite potato, the Climax, I observed that upon one stalk of pure white Climax one potato was much larger at one end than the other, and that the large end was quite red. I at once concluded that this was a sport, and reasoned with myself about the probability of this red end continuing to produce red potatoes, and larger than the parent. I laid the potato carefully away, and in the spring I planted the white portion in one hill by itself and the red portion in another hill by itself.

"In the fall when they were dug the one hill was all pure White Climax, and the other hill all red, fine-sized potatoes, not quite so long, but larger and rounder than its parent. These potatoes have shown no disposition to sport."

Following this singular appeal to unbelievers, we are given a description of the superlative properties of the new sort produced in such a sportive manner. But we confess our inability to see how Mr. ARNOLD can make out that the production of the so-called sport or variety has anything to do with the "mixing-in-the-hill" theory. He does not inform us whether there was or ever had been any red potatoes growing on his ground to mix with the Climax; and even if there had been at the time of the discovery of the sport, it would not have been proof of a mixture.

Now, this whole story, which to some others besides Mr. ARNOLD may be convincing proof of the mixing theory, really has no foundation beyond the well-known fact that potatoes often do "sport" or vary from the original type, and the variety or sport thus appearing remains fixed and can be perpetuated. The White Peach Blow is a well-known sport of the red, and not a seedling. There are also two or three varieties of Late Rose potatoes which originated in the same manner, but they are not supposed to be the result of any mixing in the hill, and to claim for them such an origin is to further mystify a mystery. It is not at all strange that our common varieties of the potato should sport, because they all came originally from the same source, and there is likely to be a little red, black or blue "blood" even in such apparently pure white sorts as the Climax.

POTATOES GROWN FOR ONE SHILLING A BUSHEL.

I AM happy to be able to verify my statement made last March, which you did me the honor to report, that I would raise Brownell's Beauty potatoes for 12½c. per bushel. Dr. HEXAMER did not believe it possible that *another* could do for 12½c. what *he* could not do for less than 30c. It is, nevertheless, an accomplished fact, and the following exhibit, taken from my farm book will confirm the statement. Lot No. 1 (Brownell's Beauty), clayey loam and sandy loam. In corn the year before without manure; no manure this year:

Dr.		
To interest on one acre at $200	14 00	
plowing and harrowing	2 00	
furrowing and covering with one horse	2 00	
12 barrels seed	9 00	
cutting and dropping	2 00	
hilling with one horse	2 00	
Cutting and pulling weeds	1 00	
digging 340 bushels at 3c. per bushel	$10 20	—42 20
Cr.		
By 340 bushels at 1s. per bushel		$42 50

The current price of potatoes in October and November was about $1 a barrel, or 33⅓c. a bushel.

340 bushels would give		$113
Deduct cost of raising	$42 00	
delivering seven loads	9 00	—51 00
Net profit per acre		$62 00

Contrast this with the Doctor's *regime:*

One acre gives 180 bushels, which, at 30c., cost	$54 00	
Delivering four loads	5 00	—59 00
Receipts from 180 bushels sold at 33⅓c.		60 00
Net gain per acre		$1 00

"Look on this picture, then on that."

As a result of the mendacity of certain parties, I was forced to pay $10 the acre for digging by hand, when they should have been dug for $3 and picked for $3, thus making my net profit $66. My Eurekas and Snowflakes make a still better showing, yielding 400 bush. per acre, which,

At current rates, 33⅓c. per bush., would give		$133 33
Deduct cost as above	$42 20	
delivering ten loads at $1.25 per load	12 50	—54 70
Net gain per acre		$78 63

Rochester, N. Y. C. C. HOLTON.

Industrial Topics.

THE FARMERS AND THE RINGS.

IT is not to be denied that the general depression of the times is unusually severe, that trade is more stagnant, and finances more embarrassed than we are accustomed to witness; while the shrinkage of values is still going on, and the prevailing distrust is creating anxiety. At the same time it is evident that in politics, as well as in business, the standard of morals has fallen from its ancient level, and is still tending downward.

This is not, I admit, a very cheerful view of affairs, but, if the facts are mainly true, they deserve, at least, some recognition. To look always and only on the bright side of things is not the dictate either of policy or wisdom. There may be many and ample reasons for anticipating a brighter and better future. But certainly one of the means for insuring such a future is to understand the present, and the causes that have made it what it is. If bad men are mainly responsible for the existing state of affairs, we have clearly nothing to gain by ignoring that fact.

While the inquiry is on every tongue, "Who is responsible for existing evils?" it is in order for every man to vindicate his calling, and as agriculture is, by far, the largest industry in the nation, it is pertinent to inquire what relation the farmers hold to their country, and to its present condition. As a class of men, engaged in an industry of the highest utility and beneficence, there is much that may be said in their favor without the imputation of flattery. In the abstract they are, perhaps, neither better nor worse than other men. As individuals, they are like the rest of mankind. But, as a class, their daily lives are passed under influences that tend to elevate the mind and give value to the character.

On the other hand, there are classes of men whose position and associations have made them as different from these as possible; whose training and surroundings have fitted them for evil courses, and whose career is in striking contrast to that of the farmer. There are, for example, brokers and speculators, who make corners in grain; who convert the market into a lottery where the blanks are divided between the producer and consumer, while the prizes are drawn by harpies who gamble away in an hour the farmer's profit of a year. There are, also, political jobbers, and ring conspirators, lobbyists and retainers who represent the organized rapacity of the country, swarming everywhere through cities and towns, and growing continually more formidable in numbers and more daring in crime.

While the tillers of the soil have been steadily working by improved methods, and increased production, to create new values in agriculture, and new sources of national wealth, the robbers of the ring have been relentlessly devouring the substance of the people on a scale of magnitude measured only by millions. While successful farmers have been, from year to year, steadily pouring into the channels of trade incredible supply of cereal wealth, corruption has radiated from party centers into legislative halls, and bad men have traded in votes without limit and without shame. While the men who own the soil of the country, and the food it produces, have been patiently working to increase the yield of their acres, and to furnish bread and meat to the people in larger abundance and at lower cost, these defiant conspirators have added to the atrocity of their plunder a still deeper wrong. They have demoralized the people by the fascinating magnificence of their crimes, until the very principles of morality on which society reposes have been submerged by the tidal wave of dishonesty and sterling integrity of character has been driven to the wall by the overbearing insolence of organized villainy.

But through the whole of this contrast between the two classes described, perhaps the strangest fact of all is the disparity of numbers. While the numerical force of the farmers rises to five or six millions, the rank and file of the rings amount to comparatively few thousands, and the ring leaders themselves, not probably exceeding a few score in numbers, are, many of them, known and identified, yet hold their position in society, evading all laws, and defiant of all justice. CONRAD WILSON.

Sloatsburg, N. Y., Jan. 1876.

AN EXAMPLE OF SUCCESSFUL FARMING.

"WILL farming pay?" is the frequent inquiry. I herewith give you my experience for the year 1875, and should you deem it of sufficient import to insert in your valuable paper, and should one of your numerous readers be benefited in the least, I will be fully compensated for the short time it required to compile from my day books.

My farm consists of 240 acres, about 116 in cultivation. The remaining 124 in pasture and hay land, except for orchard, young timber, yards and roads, to the extent of about 10 acres. The figures are as follows:

For labor of help, cultivating, harvest, storing	$487 21
Herding and feed for cattle of the farm	142 21
Lumber, posts for additional yard	91 35
Breaking new land	70 10
Taxes of 1874, paid in Feb., 1875	64 64
Live animals to replace those disposed of	631 90
Other expenses of living for family, from a paper of needles to an over-garment, board of help, small repairs of farm tools, painting, etc.	580 70
Total expenses of farm, as above stated,	$2,159 35

Receipts in cash as follows:

From cattle (fat)	$2,127 20
Hogs	956 96
Surplus grain (corn)	839 50
Butter	37 38
Hay	3 00
Sundries	6 25
Total cash	$3,970 09
Net income over all expense	$1,810 73

Am now in winter quarters, with a small increase of live animals of about equal value of January, 1875, with about $180 worth of small grain for future use of the crop of 1874, and were I to compile the cash value of pork, beef, flour, milk, butter, poultry, eggs, and a plentiful supply of vegetables that has been all the product of the farm and the greater portion of our living, are, with justice, disposed to say that farming will pay. I do not labor on the farm, that is, make a hand, and am not over-watchful, but, as a rule, keep things in tolerable running order. Am quite satisfied that this or any other farm of equal number of acres, and of equal soil, all other things being equal, run to full capacity, would show a net balance sheet of fully 100 per cent. greater. JOSEPH Z. MOORE.

Guthrie, Iowa, 1876.

THE YEAR 1875 ON A WISCONSIN FARM.

WE all know that the last winter was long and cold, the spring wet and backward, the summer cold with frequent storms, the fall frosty and wet. Still, "seed time and harvest" came to us as usual, and, altogether, the farmers of this part of the State have no reason to complain at the result of the year's labors.

Our wheat, both winter and spring, was the best crop grown in many years, the price ranged from $1.20 down to $1.00 per bushel. Oats were extra good, they are selling now at about 37½ cents. The hay crop was good, and mostly secured in good order. Corn came the nearest being a failure of any crop which we had, although we had a heavy growth and a large area planted, making much feed for stock. Potatoes we had too many, the yield being heavy and the quality good, but the price is too low for profit, being 20 to 26c. per bushel. Most garden vegetables were good, the prices of those are down, too, onions being less than 50c. per bushel. Some farmers have been quite successful in raising mangels for stock.

Fruit has been almost a total failure, and that is not the worst of it, for we have lost many of our best trees. Those who went into pork realized good prices, from 7 to 8c. per lb. Cows have done well, best butter has averaged about 35c., and cheese 13c. per lb., in our local markets. Beef is cheap. So far this winter we have had all sorts of weather, first, sleighing for a few days in November, then rain and mud and sunshine, more freezing and cold, then mud and rain, a few more days of sleighing just at Christmas, then another thaw with two days' rain at New Year's and a mud embargo on every body and everything, then froze again, but no snow yet. To-day the wind is in the south and the sun shines—a beautiful day. J. R.

Outagamie Co., Wis., Jan. 7, 1876.

Dairy Husbandry.

AMERICAN DAIRYMEN'S CONVENTION.

LEADING TOPICS OF THE FIRST DAY'S MEETING.

Mr. Arnold gave a general review of the dairy interest. He said the progress of dairying in the State of Maine had been great, and the product excellent. Thought the superior quality of the cheese was due, in part, to the large amount of Jersey blood in the stock. There are about 60 factories in Maine.

In Pennsylvania there had been a large increase in dairying. Mr. Arnold thought poor butter and cheese must continue to flow from the West for many years, owing to the state of transition. West of Ohio about 5,000,000 pounds of cheese has been produced, little of which has reached the Atlantic Coast. He spoke of Canadian cheese, which was in demand on account of its uniformity and excellence. Hence Canadian cheese is crowding out that from the States.

SHRINKAGE OF MILK IN 1875.

In Mr. C. S. Sheldon's paper on "Hints from Experience in Cheese Making" there were some interesting suggestions. He commenced by noticing the shrinkage of milk during 1875 as compared with 1874.

In 1874 he received at his factory the milk of 642 cows, and for 1875 the milk of 659 cows. The yield of milk for 1875 was 5 6-10 per cent. poorer than in 1874. The yield of milk in June, 1875, was 2 67-100 per cent. less than the corresponding time in 1874. July, 1875, shrinks 12 46-100 per cent., or 7 93-100 per cent. more than the corresponding month of 1874. August, 1874, shrinks 32 28-100 per cent., or 13 97-100 per cent. more than August 1874. September, 1875, shrinks 43 15-100 per cent., or 10 32-100 per cent. more than its corresponding month in 1874. October, 1875, shrinks 52 82-100 per cent., or 3 83-100 per cent. more than in 1874. And no month of the year has quite equaled in yield the corresponding month of 1874.

The explanation given for this shrinkage of milk during the past year was, that the feed grew faster than it was consumed: the tender, succulent grass became dry hay, losing the chief quality of milk production. This points to the importance of supplementing pasturage when it begins to fail.

VALUE OF FODDER CORN.

He mentioned an instance where one of his patrons fed fodder-corn to supplement pasturage. This patron's June milk was 3 6-100 per cent. better than the average yield of the factory for the same time. His July yield was 96-100 of one per cent. better than his June, and 10 85-100 per cent. better than the factory average. His August loses 20 37-100 per cent., but is 9 34-100 per cent. less than the average shrinkage. His September yield loses 33 8-100 per cent., but is 7 5-10 per cent. less than an average loss of the factory for the time. For the four months mentioned this patron gains 11 12-100 per cent. over the factory average for the same time, and, after deducting his increased yield for June, the ratio of his shrinkage is 8 6-100 per cent. less than that sustained by the factory. This record will be suggestive to dairymen in their summer management of cows. It shows the importance of supplementing pasturage by soiling, or by some other food.

WHOLE-MILK CHEESE MAKING.

was the subject of the paper by J. G. Canoe. He recommended cutting the curds lengthwise and crosswise, and no further. The heating, during the scalding process, continues about an hour and a quarter. Salt is applied at the rate of 2½ pounds to 1,000 pounds of milk. Mr. Canoe was very much opposed to skim cheese making, and urged the passage of a law to punish the making of counterfeit cheese.

Mr. J. R. Chapman of Madison Co. said it required more *bad* milk to make a pound of cheese than it does of good milk. He gave a great many causes for bad milk, and said the cheese maker is not responsible for those conditions over which he has no control. He indorsed the truthfulness of the lactometer in detecting watered milk, and gave instances where the same had been discovered through its use.

Seth Bonfoy, a noted cheese maker of Herkimer Co., described his process of cheese making. He sets the milk at 82 deg. Fahr., with perfectly sweet rennet, sufficient to coagulate the mass in 30 minutes so as to be of a consistency not too firm and clammy; but of a brittle texture, that will require careful cutting and handling. If carefully handled with *the hand* and carefully warmed, the whey will be of a clear, bright straw color. The curd should be largely matured in a temperature of about 92 deg. Fahr., and the finishing at 94 to 98 deg. should be short—not to exceed from 30 to 60 minutes. The heating must be slow, and as far as practicable from the sides of the vat. The curd should be handled with the hand in a light and rather lively manner, yet very carefully while warming, and the result of every move closely watched. The indications of the condition of the milk, and the result of right and wrong handling, are sure and unmistakable, but are not easily explained unaccompanied by practical illustrations. Cheese makers should be good judges of cheese.

DAIRY STOCK.

This was the subject of an elaborate and valuable paper by Leander Wetherel of Boston, and was read at the evening session. He said the best breed of cows was that which, from a given amount of feed, will produce the largest mess of milk suitable for butter or cheese. Soil, quality of cattle, breed and price are to be considered. Short-Horns, Holsteins and Swiss are among the large breeds; Devons, Ayrshires and Jerseys are of the small breeds. There are some good cows among the so-called "Natives."

He traced the history of the Short-Horns, showing that before their breeding for beef they were great milk-producing animals. Of the Holsteins, Mr. Miller of Peterboro reports an average yield per cow, during the year, of 9,597 pounds of milk. The Holsteins are superior in the quantity of milk produced, while the quality was shown to be as good as the average. He thought the Ayrshires did not yield as much milk in proportion to the place they occupied as the Short-Horns. On good keep they have a tendency to fat rather than milk. The Jersey cow produces the largest amount of rich and highly colored cream from a given quantity of milk.

Experiments have shown that 6½ quarts of milk from a Jersey would make a pound of butter, while Crossbreeds required a much larger quantity. From Natives 11 quarts of milk were required to make a pound of butter. Thomas Motley's Jersey cow, Flora, in 50 weeks made 10½ pounds of butter per week. He thought the yearly average of 500 pounds of butter per cow may one day be reached. The Guernsey cow is larger than the Jersey, muzzle broader, eyes less prominent—nose a rich yellow. She is smoother and more rotund in form, and is remarkable for the golden color of the butter, which excels that of the Jersey.

The speaker said there were three objects in view by the breeder. 1. A liberal production of milk. 2. The formation of meat. 3. The preservation of stock. Reference must be had as well to the bull as to the cow. We must separate the fatty and nutritious elements of food so as to introduce them into the circulation with as little loss as possible. Animals that give rich milk will fatten well and quickly. The formation of milk depends upon the activity of the mammary glands excited by breeding. It is the good milch cow that makes milk of her feed rather than fat. These qualities, he said, are subject to hereditary influences. A liberal supply of milk, and an aptitude to fatten, are often found in the same animal.

He thought the accumulation of hereditary tendencies, necessary to make good milch cows, is under the control of one breeder. He urged that the dairymen breed from none but animals of an ascertained and fixed type, carefully bred in a line for years, regard having been had to the development of hereditary points. Then it is that "like begets like" in the dairymen's herd as in Bate's herd. He quoted the Arab proverb: "The value of the horse is in his breeding," and said the same applied to the cow.

He was in favor of cross breeding when a farmer is unable to to purchase and keep high-bred stock. The breeder, by proper selections, and by joining like excellences and properties in size and dam, cannot fail to improve the quality of stock. Therefore, to improve stock, good blood should be on both sides. The dairyman, in beginning to breed, should have reference to the kind of land he is to stock, in determining the breed he is to select, always remembering that his ideal can never be fully realized. He must decide what are desirable qualities for him, and cross with the view of establishing them. Mr. Wetherel's address was able, and held the audience in close attention throughout.

We shall refer to the leading points in some of the other papers in another article.

THE DAIRY IN RUSSIA.

At the Dairy Fair held at Sinclairville, Chautauqua County, N. Y., in October last, Alexis Elisheff, a young gentleman from Russia, read a paper giving some information concerning the progress of Dairying in Russia. According to this writer, dairying among the peasants has been conducted in a very rude manner. For instance, the peasant, he says, has a way of cooling milk with frogs. He keeps a number of small frogs in his dairy cellar for the purpose of putting into his milk. His idea is that these cold creatures will take the heat out of the milk, and so he puts them in to keep the milk sweet longer. Somewhat recently, however, the Government has established schools for educating persons in dairy management, and rapid progress is being made under their teachings.

Mr. Elisheff, in speaking on this point, says: "Our provincial Governments have adopted a system of credit for helping the peasant. Whenever a neighborhood of peasants wish to build a cheese factory, they form a society and ask for money to carry out their design. This money is lent on favorable terms. The factories are being operated quite successfully, netting about one cent per pound for milk. Again, our Government has established a school for teaching the practical art of dairying upon the most improved methods that can be found in the world. For my own use and for the use of this school, it is that I have come among you to study your system of dairying. Two years ago a lady was sent to France to learn how to make the fancy brands of French cheese. Other agents have been sent to other countries of Europe for the same purpose, and information eminently valuable to Russia's dairying interest has been thus obtained. Sweden, Holland, England and the German States have been visited, and now in our dairy school the art of making nearly all of their fancy brands of dairy goods is being taught. The head school is near Iver, with branches being established at some points in European Russia. At this school butter and cheese making is taught in all its branches; also the care of stock, the construction of barns and other dairy buildings."

Thus it will be seen that the time is coming when we are to have another competitor in dairy husbandry; for no doubt, so soon as a surplus of cheese and butter is manufactured in Russia above home wants, the outlet for that surplus will go to the nations that now get their supply from America. And the time may not be so distant as some would imagine, since the system of Government schools renders dairy progress more rapid than it would be if left to individual enterprise.

The Swine-Herd.

FEEDING FOR PROFIT.

The difference in the feeding capacity of hogs is very remarkable, and very closely related to the question of profit. It appears, according to the authority of Joseph Harris, that 13 pounds of corn per week are sufficient to sustain an Essex pig, against 22 pounds for a common pig of the same weight. This is very nearly at the rate of 2 pounds a day for the former, and 3 pounds for the latter.

It also appears, from the experiments of Mr. Harris, that the corn fed beyond these amounts goes to increase the weight of the animal, at the rate of about 2 pounds of corn daily for 1 pound of dressed pork. If, then, we assume that these figures correctly represent the difference between native pigs and those of a good breed, it will follow that when corn is fed to the latter, at the rate of 4 pounds a day, it gives 14⅓ pounds of pork to a bushel of grain, while in the case of the native pig, a feed of 5 pounds daily, gives only about 11⅕ pounds of pork to a bushel of corn.

It will also be seen that if the daily ration is increased by 2 pounds in both cases, the better bred pig will give, on a consumption of 6 pounds a day over 19 pounds of pork to a bushel of corn, while the common pig, on a daily feed of 7 pounds, gives but 16⅔ pounds of pork to the bushel of grain. On these results, every farmer can make his own comments. If he is feeding for profit, he can see at a glance that two points are very essential. First, he must have a good breed of pigs; after that, the gain of flesh depends on appetite and digestion.

But there is another view of the case. When pork is worth 8 cents a pound, the well-bred pig that eats 4 pounds of corn a day, pays the farmer 2 cents a pound for the grain, which is equal to $1.16 per bushel, while the native pig, on a consumption of 5 pounds daily, returns but 93 cents a bushel for the grain. And here again, if the ration is increased as before, it will be seen that the better pig, with a daily feed of 6 pounds of corn, returns $1.54 a bushel for what it consumes; while the native pig, on a ration of 7 pounds a day, returns $1.35 for each bushel of corn. Thus the same great facts continually reappear, that the profit of feeding depends first, on the breed of hogs, and second on their capacity to consume and digest food.

Some of the above results are beyond the ordinary range of experience, but they are not impossible, and in fact, have all of them been surpassed. Nineteen pounds of pork from a bushel of corn, though quite remarkable, is not a miracle. James Buckingham, as stated in the Prairie Farmer, obtained 22 pounds of pork from 1 bushel of cooked meal.

The manure of a corn-fed hog, according to Mr. Harris, is worth about half a cent for every pound of corn consumed. That is to say, a bushel of corn weighing 58 pounds, if fed to hogs, will yield manure worth 29 cents. By a singular coincidence, it also appears from the late experiment of Dr. Sturtevant, that corn can be raised in Massachusetts at a cost of 29 cents per bushel. This makes the manure of a good pig equal in value to the cost of the feed. A result, so remarkable, needs to be well proved and fortified by experience. But it seems, that each of the authorities here cited has claimed even a better result than the above. Mr. Harris found that 35 pounds of feed given to an Essex pig in one week, cost 37½ cents, and produced manure worth 41¾ cents. On the other hand, Dr. Sturtevant has given the cost of corn in one of his experimental crops at 11½ cents per bushel, omitting interest and taxes.

Practical men are always slow to accept extreme figures, in such cases. Probably the most it would be safe to claim as fairly within reach of the average farmer, would be 15 pounds of pork from one bushel of corn, and 30 cents a bushel as the cost of the corn in the Eastern States. As to the dictum of Mr. Harris that 35 pounds of feed costing 37½ cents, will produce manure worth 41¾ cents, however true it may be in chemistry, it is not necessarily true in husbandry.

Conrad Wilson.

Sloatsburg, N. Y.

ARE LARGE HOGS PROFITABLE?

The question is not an unusual one, and is of such a character that it cannot be answered by a direct "yes" or "no." A very large number of hogs are marketed during the summer, and quite a number are cut up by butchers and sold green from the block. In the case of hogs cut up by butchers we would say that hogs not *excessively* fat would command the highest price, and perhaps small hogs ought to be preferred—small hogs excessively fattened, however, we should think likely to be regarded with less favor than larger ones only moderately fattened. In the case of hogs cut during the summer time in the regular packing houses, we believe hogs of moderate weights would be preferred to hogs of extremely heavy weights, because, if for no other reason, the carcasses can be cooled more thoroughly, with less liability to loss from souring. Besides, in sending hogs to market in the summer when the weather is ordinarily warm, there can be no question that hogs only moderately fat can be shipped with greater safety than animals excessively fat. So far as markets are concerned, we do not see that there is any particular preference shown for one kind of hogs over the other. Our correspondent should be able to answer for himself as to whether he can produce one with greater economy than the other. He will doubtless find, whether he make a specialty of large hogs or small ones, that the most satisfactory returns will not be found in attempting to bring either to the utmost weight of which they are capable of attaining. When the animal is growing it will give a larger increase in weight in proportion to the food consumed. As the animal increases in fatness the expense of putting on additional pounds is greatly increased. The cheapest pound is the first pound, the cheapest one hundred pounds is the first one hundred pounds, while the dearest every time is the last. If the farmer has a given quantity of corn, which he desires to feed to hogs within a given time, he will find more profit in increasing the number of swine than in endeavoring to bring a few animals to a great weight. If a hog will make a good return when fed to 400 pounds, he will do much better if fed only to 300 or 350, and an experiment may show that the last 50 pounds is, and perhaps the last 100 is, put on at a loss. The feeding of swine is quite a problem, and we trust a large number of our readers will take the trouble to observe the progress they make (weighing often) under these different systems, and give us the result of their observations.—*Live Stock Journal.*

BEST FOOD FOR SWINE.

What would be considered the best food for swine in summer would not answer the same purpose in winter. In summer, such food should be given as would keep the animal in an improving condition, and would cause it to lay on a little fat, but not so much as to cause it to suffer from the heat, as a fat porker undoubtedly does. Cooling foods, such as plenty of young clover and bran and middlings, is what we use much of, not forgetting to give regular and abundant supplies of fresh, cool water. In putting up swine for exhibition purposes, we have tried many different kinds of food for the fall exhibitions, but have found none so desirable as a slop made of corn and oats ground together, one-third of the former, by measure, to two-thirds of the latter. One of the best ways to prepare it is to scald it at night and feed next morning, put on the mass only enough hot water to thoroughly moisten it, and then cover up the barrel tight so it can steam well, and make the mass mellow, and nice by morning. If it is found undesirable to scald it, moisten the mass with water and then put in one or more pans of sour milk—thick milk or clabber—to cause it to sour by the time it is used. We use both or either plan, and find them both good. As an ordinary summer feed, we have found this food to answer almost all purposes, though we do not feed so high as when feeding the animals for exhibition purposes, as experience has abundantly proved that the breeding stock should not be very fat, only in a healthy growing condition, to insure healthy, vigorous offspring. The refuse from the truck patches, such as tomatoes, cabbage, etc., come nicely into play for summer food in connection with the above slop, as do apples—windfalls—pears, etc. —*Amer. Swine and Poultry Journal.*

The Herdsman.

CROSSING DISTINCT BREEDS.

THE advice is sometimes given in Agricultural journals to cross animals having well defined and distinct characteristics. Still more frequently we hear farmers asking whether such a course would not be advisable. One of our acquaintances asks us whether we would advise crossing a thoroughbred Jersey bull on a thoroughbred Durham or Short-Horn cow, and what the effect would be on the offspring. To this we can only reply that such a cross is not to be thought of, for the precise reason that no one could guess what the progeny would be. Both Jersey and Short-Horn breeds have been perfected in their special characteristics by a long course of in-and-in breeding—the Jerseys for milk and butter and the Short-Horns for beef and early maturity. Pure-bred Short-Horns and pure-bred Jerseys are far too valuable to be used for breeding animals whose value could not be estimated, and which very likely would have scarcely any value whatever. Suppose, for example, that the calf from a Jersey Short-Horn cross should take after the Jersey for fat and the Short-Horn for richness of milk and yellow butter, where would the breeder be? If the animal happened to reproduce the better traits of both parents, the distinctness and purity of its breed would be so broken up by crossing that it would be absolutely worthless as a specimen from which to breed.

On the other hand, a cross of a pure bred animal with a native, is pretty sure to impress on the progeny the better characteristics of the thoroughbred. Our native stock is generally a mixture of strains with many accidental individual characteristics, but very few which belong to a family. Hence, these individual characters are apt to be obliterated by the stronger potency of the thoroughbred progenitor. A second cross with the same thoroughbred or one of the same strain, still further "fixes" the pure blood and obliterates the native. By the third or fourth cross the progeny may be depended upon as breeders whenever bred to the same strain to produce animals scarcely inferior, possibly in some cases superior, to thoroughbreds. Such crosses will not do to breed from to native or mixed stock, because only in the thoroughbred are the distinctive qualities so fixed as to ensure reproduction of the best type with tolerable certainty. A cross of two thoroughbred animals combining two strong potencies, each impressing widely different characteristics, leads to no good or definite result, and should be reprobated by all breeders.

It is found quite profitable to use a Cotswold or Leicester buck on common grade Merino ewes. The lambs from this cross bring a much higher price from the butcher than they would with native blood on both sides. But there would be no advantage in crossing thoroughbred coarse wool bucks on high-priced and thoroughbred Merino ewes. Their progeny ought to be worth far more for breeding than for the butcher, and would, if blood were kept pure. It may be almost stated, as an axiom, that thoroughbred animals of any kind are, or ought to be, too valuable to use for any purpose which would subordinate their value as breeders of pure stock. So long as a full blood Short-Horn will breed, he or she ought to be worth far more than for beef, and a Jersey cow is worth more for stock breeding than for milk or butter. If not, then they are not worth breeding at all. We have not yet a tenth part of the pure blooded animals of any variety needed to improve our common stock. So long as this scarcity remains, crossing thoroughbreds is a wicked waste of good breeding animals.

For many years to come the best use of full blood stock will be found in improving common and native strains of animals as nearly as possible like the thoroughbreds they are crossed with. If your native cattle fatten easily and mature quickly, improve them still further *in the same direction* by an infusion of Short-Horn blood. If your cows are remarkable for butter or milk, apply the same rule by a cross of Alderney or Jersey. Violent changes of type confuse all calculations of results, so that the breeder has no idea whatever as to what he may expect in the progony.

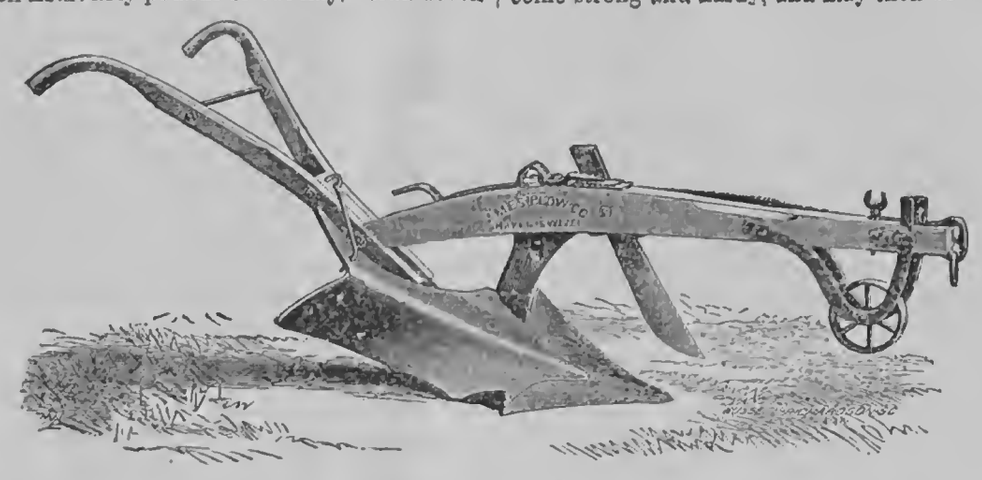
COST OF STEAMED FOOD FOR STOCK.

B. J. STONE of Westboro, Mass., writes in the Boston Cultivator:—I have tried for 25 years the feeding of dry hay and grain, and for the last 5 years I have thoroughly tried steaming my coarse fodder and roots, with most satisfactory results. I cannot afford to take my stock from steamed food and feed them on dry hay and grain, as I am satisfied with my past experience what the result would be. I will give you the cost of keeping my stock on steamed food, and would like to have some other gentleman favor you with the cost of feeding on dry food and compare results. I will give you at this time the cost of feeding 16 yearlings and 2-year-olds and 17 cows on steamed food:

150 lbs. corn fodder and straw, at $10 a ton	$0 75
96 lbs. cob meal and shorts	1 35
45 lbs. shorts fed in hay tea	50
120 lbs. dry hay	1 20
Value of coal to steam	36
	$4 16

or a fraction more than 12c. a head per day.

Mr. S. describes his method of preparing steamed food as follows:—Cut corn fodder, straw and hay, and put it into a box 10 feet long, 2 feet wide at the bottom and 3 feet wide at the top, which holds fifty pounds of cut hay. Add seven



HAKE'S SWIVEL PLOW.

or eight pails of water, with from three to four pecks of cob meal and shorts, and mix evenly, as I should to feed it directly to stock. I then pitch it down from the scaffold where I mix the feed into a large box, 8 feet long, 4 feet wide and 3½ feet high, with a false bottom made of slats four inches wide and three-quarters of an inch apart, which allows the water to settle to the bottom of the box, into which I introduce steam and boil the water. My large box holds as much as four of the small ones, or food enough to feed forty head of cattle one day, or two feeds, and with a tubular boiler I am able to cook or soften the corn butts, so they are made palatable, and not a particle of waste. It enables me to have a regular hour for feeding, both night and morn, and with one dry feed of hay at noon. I am at the present time keeping sixteen yearlings and two year olds, and seventeen cows, for $4.05 per day, or a fraction over 12 cents per head, a day. My cows on this mode of feeding give as much milk as on summer food, or by good pastures, and my young stock grow as rapidly as at any time during the summer season, and I believe that this mode of feeding is no more injurious to cattle than summer food.

RAISING CALVES IN WINTER.

INCREASED attention is being paid to the raising of calves and it is probable that fewer will be "deaconed," *i. e.* killed immediately after birth, this year than has formerly been the case. The New England Farmer gives some interesting and sensible observations on the best time and mode of growing calves:

Milkmen living near a good market often find it better to kill their calves immediately than to fat them, even in the spring, when veal sells readily, for the milk the calf takes will bring more before being made into veal than afterwards. As a rule, it does not pay milkmen to raise or fat their calves, or would not, if good cows could be easily found and purchased. With butter-makers the case is different. They have plenty of skimmed milk to be disposed of in some way, and if they are breeding a good-strain of dairy stock they may generally do well by raising their calves either for their own dairies or to sell to those less favorably situated for raising their stock. Nor is it essential that calves to be raised should all be dropped in the spring. From our own experience, we are satisfied that just as good, if not better, calves can be raised in the fall or winter as in spring or summer.

With the few we have raised in the fall, during the past ten years, we have had better success than with those started in spring. With spring calves, the temptation is very strong to turn out as soon as possible. The stables are hot and the flies are troublesome, and it seems wicked to keep the little things shut up in close stables, so they are turned out to be burned in the sun or chilled by the evening air when left out too late. They learn to eat fresh grass which, with the abundant supply of milk, causes scours, and oftentimes the calf receives a severe check in its growth by such treatment. In winter they may be kept in warm stables with perfect comfort. The farmer has more time to feed and care for them, and they soon learn to eat hay, which is really better food for a calf that drinks milk than the best of green grass.

By the time spring opens, they will have become strong and hardy, and may then be weaned from the milk gradually and turned off to pasture, with full promise of doing well during the summer. Every farmer who raises calves for his own use can afford to raise more than he needs, and than when they come to maturity he will have something to select from. This selecting the best and weeding out the inferior ones at three or four years old is one of the surest methods that can be adopted for building up a herd of cows that one will be proud of, and, if they are started well and kept thrifty all the time till four years old, they will make nice beef in a very short time on grain and grass, or good hay, for cattle fat a great deal more readily at that age than when ten or twelve years old.

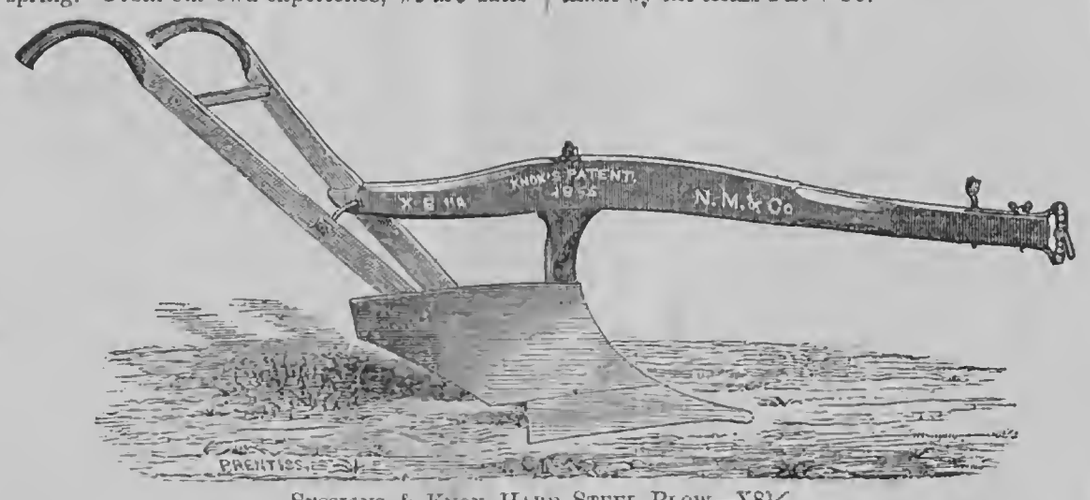
To the habit acquired by breeders of fancy stock of raising everything that has a pedigree, whether promising or otherwise, is undoubtedly due much of the prejudice against blooded stock felt by those common farmers who have been induced to invest in a small way by buying some third or fourth rate animal from a pure bred herd—an animal that ought to have gone to the butcher, instead of being allowed to go out and cast reproach upon the breed which it but poorly represents.

Our Premium Articles.

IMPROVED PLOWS.

THAT improvements should be made in articles so well known as plows, will surprise many old fashioned farmers who cannot imagine that since the days when iron superseded wood as a mold-board, any improvement was possible. The SESSIONS & KNOX Hard-steel Plow—an engraving of which we give on this page—represents a plow with mold-board, hardened to steel, on the outside, clearing well on all soils, while the center is tough and flexible, avoiding all liability to breakage—a union of very desirable qualities. The beam and handle of this plow are of the best white oak, strong and tough enough for durability but not so heavy as to be a burden either to beam or plow. Duplicate parts of this plow are kept constantly on hand by the makers, the AMES PLOW CO., at their Agency, No. 53 Beekman St., New York. We give this plow (price $19) for 15 subscribers at $2.65 or 30 at $2.15.

The Hakes' Swivel Plow is an arrangement adapting this style of implement not only to hillside culture but to level ground as well. It is made by the AMES PLOW CO.



SESSIONS & KNOX HARD STEEL PLOW—X8½.

We have frequent inquiries respecting Swivel Plows, and take pleasure in recommending the Hakes' Improved. It entirely obviates the objection to Swivel Plows that they do not run enough to land, as the sole on which the plow runs is made narrower to the rear, giving the plow a bearing toward the land—on the principle of a rudder directing the ship. The Hakes turns and pulverizes the soil as thoroughly as ordinary plows, and the advantage of plowing a field all in one land without dead furrows is one which every farmer will appreciate. We offer this plow (price $20) as a premium for clubs of 16 at $2.65 or 30 at $2.15.

The Poultry Yard.

POULTRY ON THE FARM.

A FARM of 40 acres is large enough for 200 fowls, though a dozen could not be profitably kept on it uncared for. The Spanish class is admitted to be the most profitable where eggs are wanted. They lay the most eggs and their disinclination to sit recommend them as being very valuable, but then they are somewhat tender, and of course rank among the poorest breed that the careless breeder could have. Minus of their large red combs, and with their feet badly frozen, they look mean and ordinary, and if you will not go to the pains to erect them comfortable quarters, you might as well bite their heads off, as to let Jack Frost do it. As for me, I will keep the Spanish a while longer. I only wish that I had two hundred of them. How would you manage so many? For the information of the many readers of the RURAL, I will tell you.

I would erect for their winter quarters a large, though economical poultry-shed, say 100x16. To save lumber, I would make it but 3 feet from the ground to the eaves. I would have the shed fronting the South, with at least 12 windows 8x8 in front. These would admit an abundance of sun light, so essential to the health and comfort of fowls. I would have ventilators at the East and West ends, two feet above the eaves, and five feet from the ground—high enough to prevent currents of air from striking the fowls. To the eaves on the North and West, I would have earth banked, first filling in stones and rubbish to prevent the boards from decaying. I would have a cheap, but comfortable roof put on this large shed, which shed I would not allow my fowls to use as a roosting place at all—would not allow a single perch in it. Their roosting apartment should be even warmer, but not larger than necessary for roosting purposes. This latter apartment I would attach to this huge shed on the South.

Combining those two apartments, certainly would be far more paying, than to leave fowls outdoors to freeze. Exercise too, is admitted to be of great benefit to fowls, and hence I would have some litter strewn over about one-half of the ground of this shed, among which I would throw enough wheat screenings to keep my hens busy at least half of their time, scratching. The remaining part, 50x16 feet, would be large enough for their nests, and dust boxes, and their feed, troughs, and drinking vessels. In this way, and with such winter quarters, I would expect to make my fowls well repay their keeping, if properly fed, and enjoy the care of them besides. Any breed cared for, thus, would well repay their keeping and building expenses.

F. M. SNYDER.

GROWING TURKEYS IN CALIFORNIA.

IT has often occurred to us, that the far Western States where grain and land are cheap, could beat Eastern poulterers out of sight in making cheap poultry. In California this business has especial advantages in the fact, that for six months in the year there are no storms, and the perfect dryness of soil and air is particularly favorable to young turkeys and other fowls. One-half the young turkeys hatched in Eastern States, perish from cold, wet rains or from being bedraggled in heavy cold dews. The Sacramento Valley, Cal. Agriculturist relates the following successful experience of a gentleman in in growing turkeys for the San Francisco market:

Last year, while traveling in the Visalia country, we met a flock of three hundred turkeys, which were being driven to San Francisco, to market, by a Mr. Johnson. Thinking that he must be a very successful poultry raiser, we questioned him as to his method of raising and feeding them, and as we camped together that night, we learned the following facts:

"I own half of this flock," said Mr. Johnson, "and I raise from 150 to 200 turkeys every year. I have about ten acres of alfalfa, over which I run the water. I have it fenced off in two fields, turkey tight, and then I clip their wings. I have good warm houses and attractive places for the hens to lay, and when they begin to hatch, I shut up the brood for a week or two. At first I feed them coarse corn meal, corn being very plenty in my locality, and mix it up with scalding water or sour milk. I commence from the very first to mix a little black pepper in their feed, and I am careful not to over-feed, nor let them have anything to eat later than four o'clock in the afternoon.

"When the young are about two months old, I allow the hens to take them into one of the alfalfa fields, and after that they require very little feeding, though a little scalded meal and black pepper, and occasionally a little sulphur, is very good. All the thick milk I put in troughs where they can get all they want of it."

He informed us that his present number of turkeys would bring in San Francisco over four hundred dollars. It was his calculation to keep them somewhat near Oakland, in a suitable field, until they had recruited from the trip, before offering for sale,

Pomological.

N. J. STATE HORTICULTURAL SOCIETY.

Proceedings of its First Annual Meeting.

THE first Annual Meeting of this Society took place at New Brunswick, N. J., Jan. 20—21. The attendance, though not as large as that of many older societies, was good, and considerable enthusiasm was manifested by those present. A number of new members were admitted and, with the augmented force, the Society proceeded with the work which had called them together.

FIRST DAY.

Prof. GEO. THURBER, the President, delivered his annual address, during the course of which he spoke of the small past and large future of the Society, and touched upon various matters of interest to Horticulturists in that attractive, easy and graceful way for which he is eminent. The address was enthusiastically received by all present.

This was followed by a paper read by WM. PARRY of Cinnaminson upon Raspberries. Upon this subject there ensued considerable discussion, participated in by E. P. BERRY of Elizabeth, A. S. FULLER of Ridgewood, and J. W. HAYES of Newark.

Mr. C. W. IDELL of Hoboken then read a paper on the Huckleberry, naming many varieties and explaining the manner of marketing them. It was remarked of this by one of our best Horticulturists, that, notwithstanding its briefness, it contained more information on this subject than could be found in all the agricultural books ever written—that more should be studied and known about this fruit. We shall, when less crowded for space, endeavor to publish it in full.

Prof. GEO. H. COOK of New Brunswick addressed the Society upon the subject of Fertilizers, giving detailed accounts of various experiments and tests, and their comparative results. This called out many inquiries from different members, and much information and good advice from the Professor, who seems to have made deep study of the subject.

After deciding against an evening session, the Society adjourned till 10 A. M. the next day.

SECOND DAY.

The Special Committee on Fruits and Flowers, consisting of Messrs. PARRY, HANCE, BAIRD and LOVETT, reported as follows:

MR. PRESIDENT:—This being the first Annual Meeting of the Society, we have framed our report in proportion to the extent of the Exhibition. Although it is not large, yet we think it well selected, and in consideration of there being no premiums offered and the season of the year, we think it is as large as could be expected at our regular meeting. Hoping and trusting it will be still more extensive at our next meeting, your Committee report as follows:

E. WILLIAMS of Montclair, N. J.—Thirteen varieties of apples, including fine specimens of Jersey Hawthorn, Baldwin, Northern Spy, Ortley, Roxbury Russet, Peck's Pleasant, St. Lawrence, and remarkably well-preserved specimens of Maiden's Blush, Gravenstein and Fall Pippin. We call attention to the Jersey Hawthorn of this collection as deserving more notice than it receives; also, three varieties of Pears, viz., Doyenne d'Alencon, Prince's St. Germain and Easter Beurre, and specimens of Early Ohio Potatoes—a decidedly handsome sort, of recent introduction, a seedling of the Early Rose, and said to be two weeks earlier than Vermont.

W. W. GOLDSMITH of Newark.—Three varieties of Pears, namely, Duchesse d'Angouleme, Glout Morceau and Beurre d'Anjou, all of which were remarkably well preserved. We call special attention to the fine size and quality of the Duchesse d'Angouleme and Glout Morceau.

P. T. QUINN of Newark—Exhibits a new variety, called the Quinn Pear, of surpassing flavor and remarkable keeping qualities; rich russet skin; pretty form, very handsome, though rather small; exquisite flavor, in which it strongly resembles the Seckel.

EDWIN ALLEN of New Brunswick.—Specimens of the Nero Apple—a large and fine variety.

A. HANCE & SON of Red Bank.—Specimens of the Gilpin and Carthouse Apple, valuable for its keeping qualities, being equal in this respect to the Newtown Pippin and very productive.

JOHN RASSBACH of Bloomfield—Exhibits a new Seedling Apple, of large size, red, spicy flavor and a good keeper. This we esteem worthy of further trial.

GEO. SUCH of South Amboy.—A gorgeous and very fine panicle of Blooms of Laelia Superbens—one of the handsomest Orchidaceous plants.

H. E. CHITTY of Paterson.—A number of novelties in greenhouse plants, viz., Geranium Happy Thought—a variety of most distinct and handsome foliage; Pelargonium Distinction and Solanum Hybridum Argenteum, said to have variegated fruit, but in foliage much resembling Solanum Jasminoides, also Bloom of Carnation. La Belle and Violet Victoria Regina.

The Fruit Growers' Trade Co.—A jar of cooked Cranberries, prepared for exportation. They were found to be in perfect condition and of excellent quality.

DAVID C. VOORHEES of Blawbenburg.—Specimens of Triumph Sweet Corn—a new early variety of great promise; kernel and ear large and handsome.

From the above it will be seen that Mr. WILLIAMS excels in the exhibition of apples and Mr. GOLDSMITH in pears, while we are indebted to Mr. CHITTY for the "Happy Thought" that prompted him to show us his novelties in the floral line.

In the absence of Mr. PETER HENDERSON, his paper on "The Geranium as a Bedding Plant" was read by Mr. HANCE.

The matter of the more perfect organization of the Society was informally discussed by various members, which resulted in the passage of a resolution referring the soliciting of members to the Vice-Presidents.

Mr. E. W. CRANE of Caldwell offered a resolution to appoint a Committee to memorialize the Congress of the United States and the State Legislature to adopt a uniform system of weights and measures.

Mr. E. W. DURAND of Irvington read a paper upon the "Hybridization and Production of New Varieties of the Strawberry." This elicited some inquiries and discussion, during which the "*doctors disagreed*" on numerous points.

Mr. A. S. FULLER followed with his paper on "Entomology and its Relations to Horticulture," which was published in last week's RURAL.

Mr. EDWIN ALLEN of New Brunswick read a paper on the "New Fruits of Promise."

At the request of several members, Mr. T. B. MINER of Linden related his experience in raising seedling grapes, of which he had produced large quantities. He was heard with interest and obliged to answer numerous inquiries.

Mr. W. H. GOLDSMITH of Newark read a paper on "The Keeping of Pears," and Mr. G. W. THOMPSON of Stelton one on "Hedges and Screens,"—after which the meeting adjourned, with much apparent satisfaction to the members for the progress made. G. A. C. B.

Rural Architecture.

PLAN FOR A DWELLING HOUSE.

THE house herewith described for the benefit of RURAL readers consists of an upright with wings in the rear. The size of the building is 30

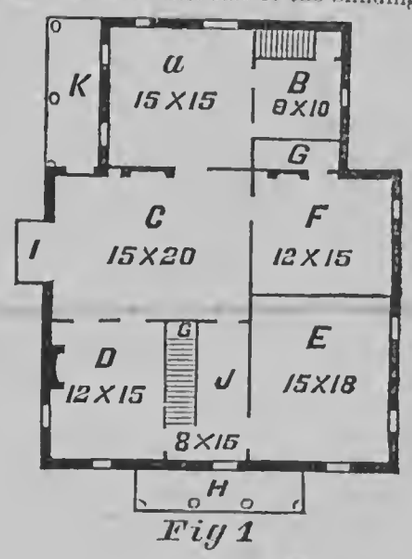


Fig 1

FIG. 1—PLAN OF FIRST FLOOR.

A, Dining Room, with Kitchen and Storeroom underneath; B, Pantry; C, Sitting Room; D, Library; E, Parlor; F, Sleeping Room; G, G, Closets; H, Porch; I, Bay Window; J, Hall; K, Back Porch. The circle is a crock for stovepipe from kitchen stove.

by 35 feet and the wing is 15 by 25. The roof of the upright should be like that of a square house (sloping four ways), and the wing should have the common double roof with gable.

The design is to have a basement kitchen under room A, Fig. 1; but where the lay of the land will not admit of this, A can be used for kitchen and C for dining-room. The space under the front stairs can be converted into two closets opening into C and D, or it may be left in one. If the kitchen is in the basement there should be

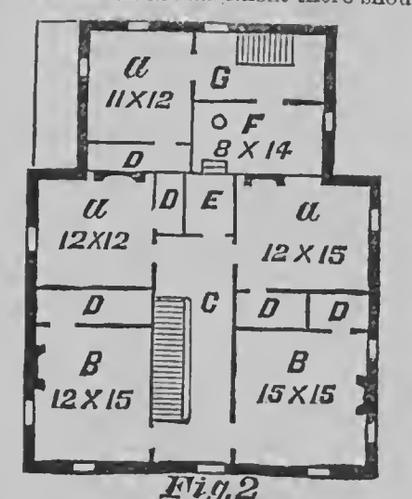

Fig.2

FIG. 2—PLAN OF SECOND FLOOR.

A, A, A, Sleeping Rooms; B, B, Front Chambers, for sleeping or other purposes; C, Landing and Hall; D, D, D, D, D, Closets; E, Linen Press; F, Bath Room; G, Landing of back stairs and hall. Crock for stovepipe is seen in Bath Room.

a dumb-waiter connecting with the same from A or B, together with the stairs leading down from B—the pantry. Doors in the outer walls are shown wider than windows.

This is a very convenient house and is capable of accommodating many persons. It can be built cheaply, and yet look well and substantial. If taste demands and purse permits, however, a great deal of elaborate ornamentation can be put upon it without causing it to seem overdone.

The arrangement of chimneys is good, but if the greatest economy is to be consulted a different plan will readily suggest itself. The pipe from the dining-room stove enters the pipe from the kitchen stove, which is carried into the chimney in the bath-room. The linen press will serve as a passage from the upper hall to the chamber of the wing, which it enters in the bath-room by descending a few steps.

If a larger dining room (A, Fig. 1) is desired, extend the wing to the right five feet, carrying the pantry and closet out even with the main building. This will give a size of 15 by 20 feet for a dining-room. F. H. G.

Modes and Manners.

THE WORK TABLE.

Now that the cold days are upon us, which keep one indoors more than usual, some helps and suggestions about fancy work, which go so far in making a lady's toilet as well as a lady's room attractive, may not come amiss.

EMBROIDERED NET CRAVAT.

One of the daintiest cravats of the season is of black or white net ornamented with embroidery silk. Those in black are especially pretty, bright-

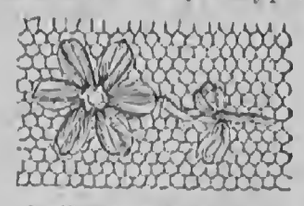

FIG. 2 EMBROIDERY FOR CRAVAT.

ened with gold, pale blue, crimson or cream-colored silk. Fig. 1 furnishes a good model. The net is turned down for a hem and worked round with chain stitch. Three rows more are worked across the ends; above there is a little spray, the details of which are shown in Fig. 2.

Floricultural.

VINES FOR A LOW TEMPERATURE.

THERE is no feature that more tends to neutralize the stiff profiles of conservatories, to soften the angles, to relieve the military array of earthen pots that—place them as we will—are matter-of-fact looking things, than a judicious selection of Vines.

It may be considered, too, that a few vines will produce the same effect as many shrubby plants—assuring the full, verdant appearance of the house—while more space is left to other subjects whose vigor and beauty are enhanced by not being overcrowded. They should be trained in those parts of the conservatory where they will cast the least shade upon other plants, and where—like a thick, ample background—they will fill the eye as the conservatory is entered. We have never yet seen a floral structure without vines—let the collection of plants be ever so choice, let them exist in their best richness and health—but what would have been rendered more naturally attractive had vines been arranged with taste so as to cover up the walls and pillars. For this purpose we mention the following as among the most deserving:

Stephanotis floribunda is a great favorite in England, though less common here. Its flowers, in clusters of half a dozen, resembling Tuberoses, are very fragrant. The leaves are opposite and thick like the *Hoya* or Wax Plant, to which, under *Asclepiads*, it is closely related. It likes close walls, sunny exposures, good drainage, little water during the resting period and occasional doses of manure water when the buds are swelling. Thus treated it may remain in the same pot for several years. A temperature of from 50 to 55 suits it. Propagated from cuttings.

Lapageria rosea is, when properly treated, one of the most beautiful vines known for cool conservatories. It is an evergreen, continuing in bloom the greater part of the year, very slow in growth until well established. It loves damp, cold, shady places and will stand a good deal of frost. A writer in the English Gardeners' Monthly says that he has a specimen twenty feet high planted against his house (Cornwall) in a corner facing northwest, and he thinks it will be found hardy elsewhere (*i. e.*, in colder climates) if planted in a bed of bog earth with good drainage.

The leaves are scanty—two inches long, ovate-acuminate—the stem green and slender. The flowers are three inches long, tube-shaped, of a deep rose color outside, delicately marbled with a lighter and darker rose within. The growth of *Lapageria* seems perpetual. It does best in sandy peat, well drained and always kept moist. It is propagated from divisions of the roots sometimes, from layers and from seeds, though from the seed to the flower several years are necessary. A temperature of 40 degrees agrees with it. *L. Alba* is the same with white flowers, but it does not flower so freely, is less vigorous and less desirable.

FIG. 1.—EMBROIDERED NET CRAVAT.

Thunbergia Harrisoni has something the habit of a Morning Glory, while its leaves resemble those of Grecian Silk (*Periploca Graeca*) varying in size, the largest five inches long. The flowers are in clusters, tubular, rather turned at the base not unlike the Snapdragon or many of the *Gesneraceae*. The tube is one and the lobed limbs three inches in diameter. The color is a sky-blue with a white throat. This does not seed freely and is propagated from cuttings. Temperature, 60 degrees.

Vinca elegantissima, grown upon brackets and allowed to droop over the pot, with its lively blue flowers and richly variegated leaf, is an attractive object.

Many of the *Passifloras—Myrsiphyllum asparagoides; Tecoma capensis*, yellow flowers; *Clematis indivisa*, white flowers; *Tacsonia Van Volxemi*, crimson flowers, borne in great profusion in wreath-like clusters; *Abutilon Mesopotamicum—Cobaea scandens var.*, well variegated with yellowish white, contrasting prettily with its large purple trumpet flowers which, however, are fewer and more ephemeral than in the unvariegated sort. It grows, we should say, ten feet in a month.

All the above thrive in a low temperature and many of them are well suited for window or sitting-room adornment.

Plant for Name.—The leaves and flowers forwarded by W. P. JOHNSON, Harthegig, Pa., are those of *Achania malvaviscus*, called also *Malvaviscus arboreus*. It is from the island of Jamaica, introduced into cultivation in 1714.

A Fruitless Orange Tree.—Mrs. E. W., of North Walton, N. Y., writes as follows: "I have a great love for flowers, and cultivate as many as time and means will permit and am generally successful. I look out to-day upon the storm through a curtain of green with only a few flowers yet to light it up, but with fair promise of more in the future. I have a pot of Callas that are magnificent. There are three of the lovely white flowers, the center one borne on a stem fully four feet high. I have also an Orange tree which I raised from the seed, now twelve years old, but which has never showed signs of bud or blossom although it grows luxuriantly. What treatment must I give it to make it blossom?"

That seedlings should not fruit as soon as grafted or budded plants is owing to the fact that, existing in a state of nature and unimpaired by any of the processes by which horticulturists hasten fruitfulness, their periods of puberty are later and their lives far longer. That vigor of the young tree which determines its stature and proportions in a manner ceases when it bears fruit, and the nutriment which previously developed leaf-buds and branches is now so modified during the period of adolescence—if we may so speak—as to induce fruit-buds as well. In the same way that an annual may be made a biennial—by nipping the first appearance of blossoms—the growth of the tree and its longevity, in a congenial soil, would be greatly extended if it were not for the debilitation caused by fruiting, which appropriates its vigor and provides for the one great object of all life—the continuation of the species. The weakest forms of life oftimes mature, as it is termed, the earliest—an immature maturity that promises and hastens an early decay. Vigor means health, strength, physical force; vitality, that ripened power which results therefrom and upon which the fruitfulness of the plant depends. If, therefore, we would precipitate vitality we must impair the vigor.

If Mrs. E. W. cannot wait for her vigorous Orange tree to mature in its own full time, she must weaken it either by destroying its leaves or young shoots, by which the sap is changed into food—by curtailing the roots which supply the sap—by withholding water or by providing a poorer soil.

We would recommend that she take up the Orange tree, wash the roots, cautiously shorten those that, as it seems to her, can best be spared, and replace it in the same soil freely and well mixed with sand. E. S. CARMAN.

River Edge, Bergen Co., N. J.

Arboricultural.

WILD THORN-APPLE FOR HEDGES.

INCLOSED I send sample of seeds of the tree which grows in this section, commonly known as the "Thorn-Apple." I am not familiar with the botanical name. The fruit is about the size of a cranberry. Will some of the RURAL friends inform me, through your columns, how to germinate them. I believe this is the natural hedge plant for this section, and wish to experiment with it. I believe that it possesses all the properties of a good fencing shrub, and any information in regard to its propagation will be thankfully received.—F. WILLIAMS, *Jefferson Co., N. Y.*

The seeds sent are those of some one of our many native species of "Hawthorn," or Thorn-Apple," probably the common Cockspur Thorn of the northern states, or, botanically, *Crataegus Crus-galli.* The seeds of these thorns do not germinate generally until the second year after sowing, consequently, it is usual to keep them one season in a kind of preparatory condition before sowing. The usual method is to put the apples in a vessel, or heap, where the pulp will soon rot, then wash out the seed clean, after which mix with sand or some kind of light sandy loam. The vessels containing the mixture should then be buried in some moderately dry spot in the garden. We usually select the north side of some building or board fence, where the seeds will get the full benefit of frosts in winter, and not become too dry in summer.

Seeds thus prepared and put in last fall, or this winter, may be left undisturbed until one year from next spring, then taken out and sown in many rows. If the seeds were sound when put in they will soon germinate after the approach of warm weather. If sown direct as soon as gathered they are likely to become injured by drouths during the ensuing season, and frequently not one seed in a thousand will grow. In their native habitats these seeds are protected from drouth by the leaves which fall upon them, as well as the shade from the parent tree, during summer, which is not the case when sown in an open field.

There is really no difficulty in producing this kind of hedge plant by the millions, if they were wanted, but they are not, and we will try to make it plain to you, and others who may not know, why the Hawthorns are utterly worthless as hedge plants in this country. It is not strange that the various species of native Hawthorns should have early attracted the attention of our farmers who were desirous of raising hedges, for many came from Britain where "Hawthorn hedges" are everywhere cultivated with success. Our native species are even superior to the foreign, being sturdy bushes or small trees, with beautiful foliage, flowers and fruit, in addition to their very formidable spines. But, with all their commended properties, their insect enemies have compelled the horticulturist to strike the Hawthorn from the list of desirable hedge plants.

In the beginning of this century the farmers in the vicinity of New York and Philadelphia were experimenting quite extensively with the native and foreign species of Hawthorns, glowing accounts of success appearing in the proceedings of Agricultural clubs and societies of that day. In the Transactions of the Philadelphia Society for Promoting Agriculture (founded in 1785) we find a number of communications, giving the experiences of the writers with various hedge plants, and the Hawthorn among the number. The first notice we find in said Transactions, in regard to insect depredations, appears in a letter of Mr. PAUL COOPER of Woodbury, N. J., communicated Dec. 13th, 1808, in which he says: "The White-Thorn is often exceedingly injured by a worm, or some kind of insect, that kills the bark all around near the surface. I was discouraged from raising any more from the seed, although the insect did not kill the roots, yet so much dead wood looks very unhandsome."

For nearly seventy years the agricultural press of this country have been annually recording the failure of Hawthorn hedges in consequence of the attacks of insects, and still, in the face of this recorded experience, we frequently receive letters similar to the above, the writers of which either claiming that the "Hawthorn is the coming hedge plant," else asking why it is not more extensively employed for this purpose. Now the principal insect enemies of the Hawthorn (*crataegus*) are the same as those which attack the cultivated apple-tree. The most destructive one, probably, is the two-striped Saperda. (*Saperda candrida*) or, as more commonly called, the two-striped apple-tree borer. This beetle deposits its eggs on the stem of the trees near the ground, where they hatch, and the young borers penetrate the sap wood, frequently completely girdling the stem, causing the death of the tree, as reported by Mr. COOPER in the letter quoted above. In an apple orchard where the trees stand singly, the grubs could be cut out, or killed by inserting a wire into their holes, but, when they once get into a Hawthorn hedge, the case becomes a hopeless one, and its destruction is only a matter of time, and usually the farmer has not long to wait in order to see the labor of years destroyed without a shadow of a chance to avert the calamity.

Another very provoking phase of this Hawthorn hedge growing is, that the borers will give no signs of their presence, (at least to the inexperienced cultivator) until the hedge is of large size or fully established, then, without any apparent warning, great patches of plants along the hedges will suddenly fail to leaf out in spring, or die in summer. This has been the fate of nine-tenths of the American Hawthorn hedges in this country. There are also other species of borers which attack the Hawthorns, among the most conspicuous and well-known are several belonging to the great family of *Buprestidians.*

The larvæ, or grubs, of these beetles are usually found in the upper part of the stems and lower branches of the trees and bushes which they infest, working just under the bark, seldom penetrating very far into the solid wood. The common flat-headed apple-tree borer (*chrysobothris femorata*) belongs to this family, and is found everywhere from the Gulf of Mexico to Canada, and westward to California. A plant with as many natural enemies as the common Hawthorn, or Thorn-Apple, is not very likely to become popular for hedges.

Diary of a Ruralist.

DAILY RURAL LIFE.

From the Diary of a Gentleman near New York City.

FUMIGATING HOUSE PLANTS.

Jan. 20.—J. G. R. of Griffin, Ga., writes:—"I want to know the names of those plants in a general collection which are likely to be injured by strongly fumigating with tobacco smoke or washing with whale oil soap. I have had to resort to both to extinguish the lice on Rose bushes and thrips and mealy bugs from my Fuchsias and other greenhouse plants. My Coleus and Begonias of the "Rex" species don't seem to do well under the treatment, and some of the leaves of my Camelias have shown a disposition to turn brown; and knowing that all plants do not thrive under the same treatment, I am led to ask for a little information on this point, and will esteem it a great favor if "Daily Rural Life" will respond."

There is, it is true, some difference in plants in regard to their susceptibility to injury during fumigation for the purpose of destroying insects, still none of those named would be considered by a florist as at all delicate. I have frequently had the plants in my greenhouse badly injured by smoke. The Heliotrope is especially liable to have its young growth cut off and leaves blackened if the fumigating is not properly performed; but the trouble is not caused by the fumes of the tobacco, but by genuine smoke. The tobacco, if too dry, will take fire and burn up rapidly, and the operator will sometimes use shavings, or even carry a quantity of burning brands of wood into the house, upon which the dry tobacco is thrown, the result being a hot, poisonous smoke, which soon destroys the leaves of all the more delicate plants. To prevent any injury from this source, the tobacco used for fumigating should always be damp enough to prevent its burning rapidly, the object being to obtain a thick, dense smoke composed of steam and the fumes of tobacco. Florists have to guard against accidents of this kind, for careless workmen will sometimes use dry tobacco, because it burns more freely, and a smoke can be gotten up in a hurry and with less trouble.

It is also well to syringe plants with pure water soon after fumigating, as this cleans the leaves and washes off the dead insects and their eggs. Where one has only a few house plants and it is not convenient to fumigate them, tobacco water may be used instead. A deep tub or half barrel of the liquid may be made, and wherever the Green Fly (*Aphis*) shows itself upon a plant, it (the plant) can be dipped into the solution, which will answer the same purpose as fumigating with tobacco. Large plants which cannot be handled conveniently may be syringed with the same liquid.

For exterminating "mealy bug" I have never found anything so good as alcohol, or even common high proof whisky will do. With a small, soft brush, one can soon clean the bugs from a hundred plants, no matter how badly infested. Dip the brush into the alcohol and then let a drop or two fall upon a cluster of mealy bugs and they will disappear. There are some very delicate kinds of plants which the alcohol will injure if used too freely; but there is not much danger in its application to the ordinary kinds cultivated in greenhouses.

BUDS DROPPING BEFURE EXPANDING.

DAILY RURAL LIFE:—I am in trouble about my house plants. They are kept in a dining-room bay-window off the kitchen, and there is a reservoir on kitchen stove, and door open more or less. They look green and very healthy; do not grow sickly. We have wood fires. The plants have been full of buds all the winter and every one blasted. Oleander is full of buds, and I am anxious to see them open. Petunias have budded and blasted continually. Scarlet Geraniums ditto. Primulas only budded once, and they are going the same way; the outside leaves turn black next to the root and die. Carnations are just budding and I am anxious to save them. I have given them a little liquid manure and soap water. What shall I do?—V. B.

Jan. 21.—I can do little more than guess at the cause of the buds dropping off. The atmosphere of the rooms may be too dry and warm during the day, and too cool at night, or you may water them too freely, although the latter is not a common fault in the management of house plants. Place a vessel of water in the room or among the plants where the evaporation therefrom will be likely to increase the moisture in the atmosphere, and then give water to the roots of the plants more sparingly for a few weeks, and see what effect this treatment will have. Of course, it is not advisable to withhold water until the foliage begins to wilt, although this would not be as likely to injure them as to keep the roots in soil continually soaked full of water.

There are many persons, who in their over-anxiety to prevent house plants from suffering for want of moisture, keep the soil about the roots in a semi-liquid condition, which excludes the air and causes disease and decay. The water plants, such as the common Calla or Ethiopian lily will thrive under these conditions, but those which are found in their native habitats upon high, dry soils are likely to suffer from too much moisture about their roots. Then, again, the greater part of the plants we cultivate in our greenhouses are natives of climates where there are heavy dews at night which wash the leaves once in twenty-four hours, leaving rains out of the question; hence it may readily be seen, that sprinkling the leaves of such plants when growing under artificial conditions is a very important operation. The water which falls in the form of rain passes down to the roots, but the dews do little more than wet the foliage and fill the surrounding atmosphere with moisture. In cultivating plants under artificial conditions, we should strive to imitate nature as closely as possible, but to do this it becomes necessary to know something of the natural history of each species, including the soil and climate in which they were originally found.

CUTTING DOWN THE OLD LOCUST TREES.

Jan. 22.—A half century or more ago the farmers on Long Island, in New Jersey and some of the adjacent regions of country, paid considerable attention to the planting of locust trees. The demand for locust timber at the time named was quite brisk and good prices were obtained, large quantities being used in the construction of vessels of various kinds. Many of the farmers of Long Island and New Jersey, scattered locust seed in their wood lands, and as the young seedlings grew up the other kinds of timber were removed in order to give the locust room to grow. Some of these old locust forests still remain, but the timber is in less demand than formerly, and it is well that it is so, for the supply has rapidly diminished of late years through the depredations of insects.

Some of the main roads in my own neighborhood as well as in other parts of New Jersey are bordered with rows of locust trees planted fifty to seventy-five years ago. But these old trees have long since ceased to be either useful or ornamental, and of late many of them have become decidedly dangerous, for their worm-eaten branches are broken off and scattered along the highways, putting the lives of those who may be obliged to pass along the road in peril. A large number of those old locust trees in my neighborhood have been cut down during the past few weeks, and I have examined these fallen monarchs with considerable interest.

The well-known locust tree borer or Painted Clytus, (*Clytus pictus*) is the larva of a handsome beetle nearly an inch long. It is of a black color, beautifully ornamented with golden-colored spots bands and stripes. These beetles appear in September, the female depositing her eggs in the crevices of the bark on locust trees, where they hatch and the grubs or borer soon penetrate the sap-wood, passing their various transformations, and appearing again as beetles in the following autumn.

Now, in examining the severed stems of these old trees lately cut down I find no marks of insect depredations, on the lower part, the first ten feet or more being sound and generally free from scars, but above this the burrows of the borers begin to appear and increase very rapidly until the growth during the last dozen or twenty years is completely honey-combed by these pests. From my slight examinations of these trees, I conclude that the locust borer was not very abundant in this neighborhood forty or fifty years ago, but as no efforts were ever made to prevent their ravages the increase in number has been quite rapid. At present every sapling and sprout, an inch or two in diameter, is certain to be attacked by this insect, consequently no one hereabout would think of planting the locust tree for any purpose whatever. The fate of the locust tree in my neighborhood will probably be its fate everywhere, as its great enemy, the Painted Clytus, is pretty well distributed over the country.

The Garden.

EXPERIMENTS WITH THERMOMETERS.

A WRITER in the Maine Farmer relates the following incident:—While working in my garden the last day of June, 1872, I found it so uncomfortably hot that I concluded to suspend work during mid-day, but on repairing to a locality of some twelve feet lower ground, I found I could work more comfortably; and to test by the thermometer the difference of heat, I placed it in several localities in my garden, embracing less than an acre of ground, and found that it varied six degrees within a distance of ten rods. My garden being composed of a clayey loam soil I had been unable to procure early vegetables and fruit so soon, by a week or more, as my neighbors, whose gardens were of a light sandy soil, and supposed the difference in the time of maturing vegetables was owing to the different soils. Since that time I have planted my vegetables, which I wished to mature early, in the locality where the thermometer indicated the highest temperature, and have succeeded in obtaining early vegetables and fruit as soon as my neighbors. I find that they will ripen ten days earlier than the same varieties planted ten rods distant in a cooler locality, and on equally dry ground.

Previous to experimenting with a thermometer I was not aware that there was so much difference in temperature in so short a distance. Probably many of your readers who find it difficult to raise early vegetables, by a little experiment with the thermometer might meet with similar success on their own premises.

President Parmelee of Michigan gives his experience of the difference of temperature in different localities as follows:—"I have long held and preached that hollows, from greater cold, are utterly impracticable as sites for orcharding. People will have it that the different temperatures at different points are owing to the difference in thermometers, and a council of instruments was called at the Farmers' Club, at which were present ten thermometers, and the trial showed an almost perfect agreement. Mr. Brinkman brought his up to my residence one still cold evening, and with mine was hung on a twig near the house. After ample time to settle we hung them in my cherry orchard, lower ground, and they went down nine degrees. We then carried them about a stone's throw west, to the top of a ridge, and they came up eight degrees, and the difference of altitude was only eleven feet. We then took them down on the little lake, between my house and the dock, and they sank twenty-three degrees. On my return home, my thermometer came back to the starting point."

It is very common during some seasons of the year, to find warm currents of air varying from a few feet to several rods in width. These warm currents are usually found on hills, and probably are deflected by local causes, forests, buildings &c. It is an interesting query whether any locality in a neighborhood is permanently warmer than others, except as exposure to the sun and reflection of the suns rays, might naturally account for the difference. We have sometimes thought that variations existed which could not be easily accounted for, but lack definite facts to warrant the expression of any theory.

PECULIARITIES OF SEED-GERMINATION.

THE instance quoted by Mr. Webster, says the Gardeners' Chronicle, of a Plum seed vegetating after having been boiled in the jam, is not the only one of the kind on record. Dr. Lindley has mentioned a case of Raspberry seeds vegetating after being subjected to the same ordeal, and he also states that the practice of boiling the seeds, of leguminous plants especially, with the object of making them germinate more readily, had been adopted by several persons with perfect success (Theory of Horticulture). The fact does not appear so wonderful when we know that seeds will stand without injury a temperature as far below the germinating point as above it. I suppose an extremely low temperature is as destructive to vitality as a high one, and that both act something in the same way. Seeds seem fitted by Nature to survive under very adverse circumstances, existing for ages if buried deeply, and, what is quite as singular as anything, passing unscathed through animals that have the power of digesting very extraordinary substances.

TO PREVENT CLUB-FOOT CABBAGE.—A German market gardener in Pennsylvania, in putting out his cabbage, followed the German custom of "puddling" the roots of a part of his plants in a thin mixture of cow-manure and water. Five rows thus treated entirely escaped disease, growing prosperously, while the remaining portion of the crop, one thousand four hundred plants, all died.

Domestic Economy.

HINTS FOR YOUNG HOUSEKEEPERS.

When oil-cloths are put down around stoves, they wear out on the edges quickly unless protected in some way. Strips of zinc are used by some, but are not as good as common carpet binding, doubled and tacked along the edge, or one edge of the binding put over the oil-cloth and the other under and fasten with tacks. Strips of full cloth—gray, or any shade to suit the taste—will answer very well, and can often be cut out of the best part of a garment that has been thrown by. For a common room this last is as good as anything, and is the most economical.

Molding Candles.—The wicks should not be too large, or the candles will burn away too fast. Double and twist the wicks, to make them as compact as possible before dropping them into the molds, or the candles will run down as they burn. Do not have the tallow too hot. Moderate freezing weather is the best for molding candles. If the tallow cools too fast it is apt to crack and cleave away from the wicks. Candles burn better if they have been made some time before they are used. Every housekeeper worthy of the name will have candles to go about the house with, instead of kerosene lamps. If they do not make them they will buy them.

To Bake Beef.—Lay the meat on some sticks in a dripping pan or other vessel, so that it will not touch the water which it is necessary to have in the bottom. Season with salt and pepper, and put in the oven three or four hours before it is wanted for the table. Baste it often with the water in the bottom of the pan, renewing it as often as it gets low. This makes sweet, juicy baked beef. The great secret of it is, not to have the meat touch the water in the bottom of the pan, and to baste it often. Tough, unpromising pieces of beef are best cooked by steaming them an hour and a-half or so, and then putting them in the oven and baking as much longer. Farmer's Wife.

ECONOMY OF HEAT IN HOUSES.

"T." writes as follows in the Western Farm Journal on a subject which is of interest to all housekeepers:—For a number of years the writer has used, for warming three rooms, a single heating stove, the heat from which passed into two drums. One of these drums is placed in a room adjoining that containing the stove, and the other is up stairs in a room above the second one. For several weeks experiments have been made, by observations with thermometers, which prove that the intermediate drum, or that between the stove and last one, heats the room from six to twelve degrees hotter, (according to the wind,) than the stove can heat, though both rooms are of the same size, and the drum is somewhat smaller than the stove. The room up stairs, fully 35 feet distant from the fire, is made quite comfortable, for a sleeping room, throughout the entire winter.

These facts are only stated to show what an immense amount of calorie is wasted by our system of heating with stoves, the pipe from which passes into a chimney or directly into the open air. Fuel, and consequently expense, is not only saved by the use of sheet iron drums, but the house is more comfortably and completely warmed, not only with less fuel, but with no trouble of making and keeping up fires, carrying in wood or coal and carrying out ashes, and cleaning up the dirt caused by doing so.

SELECTED RECIPES.

Cottage Pie.—In the bottom of the pie-dish put a good layer of nicely minced mutton or beef, season to taste, add an onion chopped fine, cover with mashed potatoes, and bake in a sharp oven half an hour, or until the potatoes are well browned.

Hominy Croquettes.—To a cupful of cold, boiled hominy, add a teaspoonful melted butter, and stir it well, adding by degrees a cupful of milk, till all is made into a soft light paste; add a teaspoon white sugar, and one well beaten egg. Roll into oval balls with floured hands; dip in beaten egg, then roll cracker crumbs, and fry in hot lard.

Apple Meringue.—Pare, slice, stew and sweeten ripe, juicy apples; mash smooth, and season with nutmeg or lemon-peel; fill a pie-plate with an under-crust, and bake till done. Then whip the whites of three eggs for each pie to a stiff froth, with a little sugar, one tablespoonful to an egg, beat till it stands alone, then spread over the pie three-fourths of an inch thick; return to the oven 3 or 4 minutes to brown.

Glossed Shirt Bosoms.—Take two ounces of fine white gum arabic powder, put it in a pitcher and pour on a pint or more of water, and then, having covered it, let it stand all night. In the morning, pour it carefully from the dregs into a clean bottle, cork, and keep it for use. A teaspoonful of this gum water in a pint of starch, made in the usual way, will give to lawns, white or printed, a look of newness, when nothing else can restore them, after they have been washed.

Rice Coffee.—This is good food for children suffering with summer complaints, and is made by browning the grains of rice in the same way as coffee, and afterward boiling them. It is not unpalatable, is very nourishing, and can be made any strength required. With the addition of sweet cream and loaf sugar, a child of two or three years will require no other food until the disease is removed.

Washing Linen.—This is the way they wash linen in Belgium: Dissolve two pounds of soap in about three gallons of water as hot as the hand can bear, and add one tablespoonful of turpentine and three of liquid ammonia; the mixture must then be well stirred, and the linen steeped in it for two or three hours, taking care to cover up the vessel containing them as nearly hermetically as possible. The cloths are afterward washed out and rinsed in the usual way. The soap and water may be reheated and used a second time, but in that case half a tablespoonful of turpentine and a tablespoonful of ammonia must be added. The process is said to cause a great economy of time, labor and fuel. The linen scarcely suffers at all, as there is little necessity for rubbing, and its cleanliness and color are perfect.

Hygienic Information.

BEING "OUT OF SORTS."

In his presidential address before the Clinical Society of London, Sir William Jenner alludes as follows to the bodily condition which is popularly called "being out of sorts":

"We are apt to pay too little attention, to attribute too little importance, to the general 'out-of-healthedness' which is so common in previously healthy persons from overwork, from anxiety, from over-feeding, from over-stimulation short of so-called intemperance, from want of food, from bad air, from deficiency of exercise, from deficiency of stimulus; to 'out-of-healthedness' in which the patient refuses to admit that he is ill, although he is a little, as he says, out of sorts, and only seeks advice because his friends notice that he does not look well, and urge him to consult a physician.

"This condition cannot be studied in hospitals. Those only who are engaged in family practice can trace the origin, can watch the course, can estimate the effects of this condition in all its bearings. For myself, I have been long satisfied that a very large proportion of the subjects of organic diseases, tubercular, malignant and degenerative, using those words in their widest sense, are mistaken when they attribute the symptoms of imperfect health, from which they have long suffered, to incipient local disease, and for not detecting which they too often blame their first medical attendant. The deteriorated general nutrition to which I have referred as mere 'out-of-healthedness' was the cause of their sense of want of perfect health; and, ultimately, this imperfect general nutrition of every part of the body culminated in the extreme mal-nutrition of that part or organ which natural constitution or accidental circumstance had rendered less able to resist organic change."

HYGIENIC NOTES.

For Chapping.—To cure chapped hands, rub cold cream on them on going to bed.

For Corns.—To cure corns, lay a piece of raw fat pork upon them. The corn will disappear in a few days.

For the Appetite.—To restore the appetite, take half a pound of valerian root and make tea of it. Take a wineglassful at night, on going to bed.

For Scarlet Fever.—An eminent physician of Chicago says he cures ninety-nine out of every one hundred cases of scarlet fever, by giving the patient warm lemonade with gum arabic dissolved in it. A cloth wrung out in hot water and laid upon the stomach, should be removed as rapidly as it becomes cool.

To Purify a Sick Room.—If onions are sliced and kept in a sick room they will absorb all the atmospheric poison. They should be changed every hour. In the room of a small-pox patient they blister and decompose very rapidly, but will prevent the spread of the disease. Their application has also proved effectual in the case of snake bites.

Pumpkin as a Poultice.—A correspondent of the New York Farmers' Club gives an instance in which a woman's arm was swelled to an enormous size and painfully inflamed. A poultice was made of stewed pumpkin, which was renewed every fifteen minutes, and in a short time produced a perfect cure. The fever drawn out by the poultices made them extremely offensive as they were taken off.

Patrons of Husbandry.

THE GRANGE IN ENGLAND.

The London, (Eng.) Farmer, after speaking of the wonderful success of the Patrons of Husbandry in this country, adds:

"We will not at present stop to discuss the merits of Granges, or whether, as adverse critics say, they may not grow some day into a great monopolizing dictatorial power, representing class interests only to the danger of the rest of the community. But the power of combination amongst the Patrons of Husbandry, or Grangers as they are otherwise called, we greatly admire. It would appear impossible to persuade English farmers to combine their interests so effectively for any purpose under the sun. They are divided amongst themselves, or they might return a large number of their class as representatives to the House of Commons. Then, again, our Farmers' Clubs and Chambers of Agriculture are badly attended; several have of recent years become extinct, and others are in a moribund state for want of hearty support. What is the solution of the question? Is it peculiar to young countries to maintain a heartier brotherhood than those which are old? Whatever we may think of the Granges, English farmers have certainly a few lessons to learn in the power of combination for the advancement of their mutual interests."

It is probably true that there is more neighborly and brotherly feeling in new communities than in old as witness logging bees, house and barn raising in new settlements, etc. But Patrons of Husbandry have achieved their greatest success in communities where members had become comparatively independent. The secret of Grange success lies in its social reforming and humanizing influence on members, and especially on the introduction of women as important and influential members of the Order. These peculiarities are inherent in the Grange system and their success is not necessarily limited to any section, country or clime. As a means of combining farmers for their mutual improvement and advantage nothing like it has ever been discovered in this country, and there is little doubt that it will be proportionately successful, not only in England, but ultimately wherever tillers of the soil or keepers of flocks and herds are found. As the experiment is soon to be tried in England, friends of the Order will watch with interest the result.

THIRD CLASS MAIL MATTER.

The members of Hesperian Grange, Red Willow Co., Nebraska, have adopted a petition to Congress asking for a restoration of cheap postage on all third class matter. They ask the co-operation of good Patrons everywhere in petitioning for the repeal of the present odious law. From their address we copy the following;

The law enabled the pioneers on our frontiers, who are doing so much to open up the wilderness and make the great American desert blossom, to obtain books, seeds, clons, cuttings and any little articles needed in their business or for the comfort of their families, at a small cost over that paid by people of the cities and larger villages; and this did much to lighten the hardships of pioneer life. It brought remote corners of our land and the commercial centers into close connection. Thousands of places never visited by an express agent were weekly receiving articles of necessity. The hardy farmers of the Western prairies and the Postal Department were both benefited thereby.

Will officers of Granges and others under whose notice this may fall bring it before the Grange at their next meeting, move in the matter and send to their Congressman a petition for the reduction of third-class postage? Patrons turn out! Ye are a strength in the land that can be felt.

NEWS AND NOTES FOR PATRONS.

There are 712 subordinate Granges in the State of Georgia.

At the session of Knickerbocker Grange, this city, Dr. Elder, Master of an Indiana Grange, and C. F. Hanby, Past Master of the Grange in Greeley, Colorado, were present.

Walworth (N. Y.) Grange, No. 289, is in good condition. The members are punctual in their attendance, take a lively interest in the meetings, and always have a good time.

The following are the officers of Greenport Grange, N. Y.:—Jacob H. Proper, M.; Richard Becker, O.; Morris Miller, L.; Charles Miller, S.; Martin Hallenbeck, A. S.; Andrew Hallenbeck, C.; Philo Couse, S.; Richard Miller, T.; George Foland, C. K.; Mrs. A. Hallenbeck, L. A. S.; Mrs. R. Becker, C.; Mrs. George Foland, F.; Mrs. M. Miller, P.

At the regular meeting of Jefferson Co. (N. Y.) Council held at Watertown, Jan. 5, the following officiers were elected:—Frank Hadcock, M.; George H. Hall, O.; O. W. Baker, L.; O. S. Potter, S.; Z. J. Seriven, A. S.; Elliott Makepeace, C.; J. W. Overton, T.; Charles E. Hadcock, Sec.; W. C. Lyttle, G. K.; Mrs. L. D. Olney, C.; Mrs. J. W. Overton, P.; Mrs. I. S. Morey, F.; Miss. Mary Durham, L. A. S.; Executive Committee—L. H. Bishop, E. Clements, M. Barrows, G. W. Rickett, Luke Fulton.

Sheep Husbandry.

POINTS OF A GOOD SHEEP.

A Committee of the Washington County (Pa.) Ag. Society recently visited the farm of W. Lee Archer of Jefferson Township, and at its request he gave a description of a perfect sheep, which we copy below:

1st. Of the form — first, the countenance should indicate docility; the eye of gentle and quiet-like expression; the form of the head broad or wide between the ears, and also between the eyes; the bridge of the nose broad, and wide in the nostrils, with thick lips; the ears large, thick and mellow: the measure should be short from the eye to the muzzle; the neck should be short and thick, carrying the thickness well up to the head; the top of the neck full and rising, from the wither to the crown of the head; the withers and back should be in line; the rump or tail drooping but little from the line of the back; the brisket projecting well, heavy and broad enough to spread the shoulders sufficient to admit a large hand between them; the rib should be full rounded; batrel shape chest; loins short and broad; the hams muscular and heavy; well joined behind and full from the tail down to a line of the belly and brisket; legs should be short, with heavy bone, which will be an index to the bone of the whole animal; the hind legs should present a perpendicular line from the root of the tail to the fetlock or foot; hock and stifle broad; the foot neat and square under the sheep, and free from trumpet-hoof form.

2d. Rams when full grown should weigh from 125 to 180 pounds in full fleece. The ewes, when fatted, should average, without wool, 100 pounds.

3d. Covering.—It is desirable to have a staple three inches long and of uniform length, including the belly, and of sufficient density to form a smooth, even surface, also to prevent the fleece from parting on the back.

The Committee in announcing this report issue a congratulatory cackle, averring that the above description is the most wonderful scale of points ever promulgated. To our view scales of points are usually fanciful and of doubtful utility—an attempt to make an exact science out of what baffles the closest analysis. Fixing the relative value of points is an absurdity. Exceptional excellence in one important point may give the highest value, almost irrespective of minor defects, as men with a decided genius for anything are not judged according to their less exceptional talents. It counts nothing against Dexter, the great trotter, that he has white feet, though thousands of humbler horses are less salable for this blemish.

In this description of a good sheep, covering is vaunted third in order of importance and character, and texture of wool is made entirely subordinate. For the great majority of sheep the wool is the supremely important point, and their value to the breeder depends almost entirely on its texture, weight and general character. In plain truth, Mr. Archer has given a good description of an excellent sheep for some purposes, and for this he deserves credit. To make anything more of his scale of points as a universal standard of value is only to expose him to undeserved criticism on account of unwise landations of indiscreet friends.

FAT SHEEP FOR HEAVY FLEECE.

A writer in the Country Gentleman says: "There is much said about ewes being too fat to breed well. In my experience of twenty years I have never seen anything that led me to think so, providing the flesh was put on with good pasture during the summer, and a few roots with good hay in the winter. The fatter sheep become under such circumstances the more valable I consider them. There is no time in the year when it pays better to feed a small allowance of grain daily than in the fall after the feed gets frozen, and it is not necessary to bring the flock to the barn.

"It is an old saying that 'sheep well-Novembered are half-wintered.' Keep the ewes fat, and the lambs will be fat and the fleeces heavy. I do not say that it is better to have the lambs come early or late, but I do say it is best to have them fat; but whether early or late, they are salable. All ewes, that with good care, will not raise a lamb and shear four lbs. of washed wool, should be sold. I have them in my flock that will shear nine lbs. and raise a pair of twins, and it costs no more to keep one, than a sheep that shears but three pounds. I think that no one will hear the man who keeps his flocks in this way, complaining because his sheep are all "run out." and do not pay him, and the like.

Ticks must be kept out of the flock; they are the worst enemies of the sheep. If they are not killed they will destroy the sheep. For killing them I have tried nothing better than tobacco juice.

"PROGRESS AND IMPROVEMENT."

SATURDAY, FEBRUARY 5, 1876.

THE GREAT INCREASE OF TAXATION.

In accounting for the "hard times," the enormous increase of taxation cannot easily be overlooked, as it surely ought not to be. The era of war was one of flush times for money, of private and public extravagance, and, as a natural result, of loose ideas of financial integrity. The moral sense of the country was pretty thoroughly absorbed in patriotic and philanthropic efforts, so that such ordinary virtues as integrity in money affairs had a decidedly poor show. There was a stronger feeling of partisanship during this era than ever before, so that jobbers and contractors had greater power to run local and State governments into extravagance, and unthinking taxpayers foot the bills. Besides, most of these extravagant jobs were funded in debts, and so saddled on posterity. Increase of taxation only began when necessitated to pay interest on large accumulated debts. At all events, it only then began to be oppressive. While prices were high the heavy taxes were little felt, and many a farmer or business man, wondered how easily he could raise amounts, which, in previous years, would have been felt as an unsupportable burdens. All is changed now. The era of high prices has passed. Dull times and high taxes have followed. It has been shown that more than all the currency is paid each year in Federal, State, County, City and Town taxes. Luckily the authorities cannot well keep this money; but have to pay it out, else the business of the country would come to a standstill for lack of money to carry it on.

The New York Daily Bulletin has done the country good service by compiling some tables, showing the increase of expenditures in 1875 as compared with 1860. The ordinary expenses of the general government, excluding interest on debt, were, in 1860, $60,910,185; in 1875, they were $178,518,983. Population in 1860, 31,443,322, and in 1875 estimated 44,000,000. In other words, the increase in population is 40 per cent., and of ordinary expenses of the government is over 200 per cent.

Some of the States show a much larger proportionate increase, and the cities greater yet. New York State increased in population only 28 per cent., but the increase in State tax levy was from $4,376,169 in 1860, to $15,727,482 in 1875, or 260 per cent. increase. New York City has increased in population 36 per cent., but the city taxes have increased from $6,000,000 in 1860 to upwards of 24,000,000 in 1875, or more than 300 per cent. The same results are found in nearly every State where a large city exists. Boston has increased its tax vastly more than Massachusetts, Philadelphia more than Pennsylvania, and Baltimore more than Maryland. The annual taxes, however, represent but a small share of the extravagant expenditures of cities. Debts are piled on nearly every city in the country, often to the limit, or beyond, that its credit will bear. State debts have not grown in proportion. Most of the States are now steadily reducing indebtedness incurred during war times, and some are entirely or practically free. The following table shows the increase in city debts during the past eight years:

Cities.	Debt in 1867.	Debt in 1875.	Increase.
Allegheny	$ 300,935	$1,667,000	$1,366,065
Albany	744,500	1,780,000	1,035,500
Baltimore	23,762,632	33,943,425	10,180,803
Boston	13,021,463	45,512,611	32,491,148
Chicago	4,757,500	12,456,000	8,698,509
Cleveland	1,181,466	4,718,500	3,537,034
Detroit	1,194,168	2,382,900	1,188,732
Louisville	4,256,747	8,325,000	4,068,253
Milwaukee	978,755	2,644,963	1,666,208
Newark	2,110,000	5,666,000	3,556,009
New Orleans	14,643,275	23,002,030	8,358,755
New York	32,991,742	122,807,280	89,815,538
Philadelphia	35,165,631	64,299,464	29,133,843
Portland	1,673,100	5,254,628	3,581,528
Providence	1,993,000	8,948,046	7,155,046
Pittsburgh	3,035,746	13,533,819	10,498,073
Richmond	2,071,542	4,632,708	2,561,166
Rochester	1,003,009	5,420,000	4,417,000
St. Louis	5,638,000	16,570,000	10,932,000

These figures show pretty clearly that the great cities are responsible for the most of the heavy burdens under which industry is depressed. All these debts, and the yearly load of taxes for interest, have to be ultimately paid by the productive industry of the country, and of this, by far the larger part is engaged in agriculture. It is time that the farmers of the United States should arouse to their true interests. They had little to do with the enjoyable part of this business—the making of these city debts; but when they are to be paid, the farming interests of the country must suffer. This is the tax which the people are now paying in business depression.

That plain, practical farmers manage these affairs better is shown by the moderate increase of taxation in States which are mainly agricultural. While the population of Chicago increased 262 per cent., from 1860 to 1875, the tax swelled from $373,315 in 1860 to $5,468,692 in 1875, or an increase of 1,364 per cent. In the meantime the population of the State increased 77½ per cent., while the State tax levy of Illinois was $3,256,670 in 1875 against $2,523,536 in 1860, an increase of only 28 per cent., or less than the increase of population. In other words, the State taxes are less for each citizen than they were fifteen years ago. We remember that the farmers of Illinois inaugurated an independent political movement, two years ago, and secured the State Legislature. The Independents were roundly abused by the partisan press, and their Legislature pronounced a failure. But such results as this are a great deal more comfortable for taxpayers than brilliant successes, whose brilliancy consists in debt and heavy taxation on the industry of the country. Not only farmers, but all engaged in productive industry of any kind, need to take more part in public affairs wherein they are so vitally interested.

The methods of collecting taxes add to the burden on industry almost if not quite as much as the amount. "Practice makes perfect" is an old saying, and probably true of tax levying as of anything else. It would seem that this country has never yet laid taxes sufficiently to learn to do it, and to realize money with the least burden to industry. If this be so it is high time that the lesson was learned. But this properly belongs to another subject, and must be continued in another article.

MILITARY EDUCATION.

It is proposed to cut off the pay of cadets at West Point $50 a year as a measure of economy. A much better policy would be to abolish the West Point Military Academy altogether, and let candidates for the military profession get their education at their own expense, the same as members of other professions do. Docking each cadet would only save $15,000, and if Congress debate the subject one hour, the expense of the debate will be far more than the saving to be effected. The importance of military education to the country has been greatly over-estimated. It is true the country sometimes needs soldiers; but so also it needs surgeons, diplomats and lawyers, but no one thinks of giving professional education to these at public expense. As it is now, the country is taxed to pay the expense of giving a military education to several hundred young men, mostly sons or friends of professional politicians. Their tuition and expenses are paid by Congressional appropriation and at the same time they are paid a salary while receiving this gratuitous education and given a lucrative position if they choose, immediately after leaving school. There is no assurance that the services of these graduates will be available in case of need. It is a pure gratuity, nothing more.

Military science is a profession which will find no lack of students without the fostering care of Government. The danger is that ambition, and a multitude of other reasons, will lead too many young men to make war the career of their lives, instead of pursuing some avocation for the good of their fellow men. The country is probably more in need of good farmers than of men in any other business. A few years ago Congress appropriated some public lands to each State to promote Agricultural Education, and as a result we have Cornell and other Universities. But no one ever proposed or dreamed that the country ought to educate the farmers it needs and give them a salary while paying their way through a scientific course. Yet a better argument could be made for doing this than for maintaining the aristocratic and worse than useless military institution at West Point. The higher interests of the country do not lie in war, and the military spirit needs repression rather than encouragement.

Dairy Associations.—The Western Reserve (Ohio) Dairymen's Association meets in Garrettsville, Feb. 9-10. The Tenth Annual Convention of the Northwestern Dairymen's Association will be held at Fort Atkinson, Wis., Feb. 8-10.

RURAL NOTES AND QUERIES.

Weather Wisdom.—Over a decade of years ago—indeed some time before "the late unpleasantness" between the North and South—Prof. M. F. MAURY, then Superintendent of the National Observatory, contributed a series of able articles to the RURAL NEW-YORKER on "Meteorology for Farmers." The co-operation of Farmers, Agricultural Societies, &c., was requested to aid him in extending from the Sea to the Land the beautiful and valuable system of research which had given world-wide renown to his previous labors. The Professor promised the rural population results which should be as valuable to the outdoor industrial products on shore as those already obtained had proved to be to commerce and navigation. Connected with Prof. MAURY'S plan was a system of *Telegraphic Meteorology*, which was taken up in other countries, and subsequently perfected in our own—as witness the Probabilities daily telegraphed to all parts of the country from the National Signal Service Bureau, under the superintendence of Gen. MEYERS. The articles alluded to, being the first popular series on the subject, were quoted from and commended by leading journals at home and abroad, and no doubt had great influence in securing the advantages now derived from the usually reliable Weather Reports of the above-named Bureau.

The preceding paragraph—giving "honor to whom honor is due"—was suggested by the receipt of a circular from Prof. WM. BLASIUS of Phila., Pa., a noted Meteorologist, and author of a work entitled "Storms: their Nature, Classification and Laws." Prof. B. says that the evidences which Nature gives of an approaching change of weather are in general easily seen by any one who know hows to look for them,—and that "the advantage, and even prime importance, to agriculture, navigation, and all out-of-door pursuits, as well as to the health and comfort of all, of a system of weather prediction which can be understood and readily applied by the unprofessional person, is manifest." Professor BLASIUS wishes to popularize a system, the correctness of which is proved by his own experience as well as that of many others, and therefore offers to address scientific bodies, agricultural societies and colleges, lyceums, etc., to whom the subject is of interest. The lectures will be illustrated by diagrams, etc., and the terms within the reach of all. We trust many agricultural and scientific associations may be benefited by hearing the Professor.

The Disappearance of Buffalo Grass.—Prof. SAMUEL AUGHEY of the University of Nebraska writes to the Tribune that buffalo grass has for some years been driven back westward in that State at the rate of twenty-five to thirty miles per year. Various theories are offered to account for this phenomenon, which does not seem to result from the disappearance of the buffalo, as in some localities the grass remains years after all buffaloes have been driven away. Prof. AUGHEY'S theory is that the disappearance of the grass is caused by a change in the climate—that the original alkaline deposits in the soil are favorable to it, possibly by excluding other vegetation. The climate of Nebraska is gradually growing moister, and as the alkali in the soil is diluted and washed away the grasses belonging to civilization have a chance. This increase of moisture does not take into account the exceptional season of 1875, but is based on several years' observation. In many old stream beds which had long been dry water has commenced to flow, and new springs of water have broken out where never known before. It is highly probable that this is a real change in climate, induced by civilization, lines of railroads and telegraph, and fires from thousands of homes, carrying currents of warm air into the upper atmosphere and causing frequent rainfall where it had been a rarity before. If this theory prove true, we may expect to see the "Great American Desert," which was a reality twenty or thirty years ago, gradually recede and a fertile region blossom in its stead, as the march of civilization makes new territory necessary or desirable.

Our Mild Winter.—The Tribune, speculating as to the facts and causes of our unusually mild winter, closes its article with the hope that it may prove proportionately mild to the explorers now wintering in Northern seas and striving to make discoveries in that gloomy region. In the wish which this hope expresses there will be general concurrence, but its realization is against all the probabilities. Our mild winter is caused by the fact that we are enjoying the currents of warm air from the South, which usually flow far above us in the upper atmosphere till they approach the North Pole, when, becoming colder, they sink by their own weight and send a cold polar wave near the surface southward. We have had few of these polar waves this winter, hence the probability is that few waves of comparatively warm air have reached the poles. In brief, the naturally cold weather of arctic winters has this year "staid at home" to an unusual degree, and we may expect, when we hear from the arctic explorers, to learn that the winter of 1875-6 was one of extreme severity, as the polar winter of 1874-5 is now known to have been of unusual mildness. Our prediction of a warm winter was made in the RURAL NEW-YORKER of Aug. 28th last.

Cheap Postage.—"The Farmer in Politics" has achieved his first triumph in the passage by the House of Representatives of the Bill restoring cheap postage on third-class matter. This is a good beginning. How does the country like the farmer in politics thus far? The Bill was reported by J. B. CLARK of Missouri, and advocated by Hon. WM. LAWRENCE of Ohio and Hon. S. J. RANDALL of Penn. Hon. J. A. GARFIELD of Ohio made a speech, claiming that the increase of postage last winter was a mistake; but arguing that the Post Office Department ought not to transmit any merchandize or articles other than written or printed matter. It looks more and more as if the "blunder" last winter was a cunningly-devised plan in the interest of the express monopolies. The Bill has yet to go to the Senate, and the country will look with interest to see what Senator HAMLIN has to say on the subject.

A Kansas Fruit Farm.—Professor GALE of Manhattan, Kan., thus writes relative to the enterprise of a noted fruit grower in that State:—"We have just visited Hillsdale Fruit Farm; near Parsons, on the M., K. and T. R. R., owned by C. G. WICKERSHAM, Esq., a gentleman of more than thirty years' experience in fruit culture. Mr. W. is doing a good work for himself at an expenditure of cash which few horticulturalists in Kansas are able to make. He is doing a work which will be invaluable to Southern Kansas, and measures have been taken, through the Experimental Committee of the State Horticultural Society, by which his experiments will be made available to the State."

Brook Trout Free of Cost.—The Commissioners of Fisheries of New York State have issued the following card, which will be interesting to many readers:—"Young brook trout will be delivered free of expense at the New York State Hatching House, at Caledonia, after February 15, 1876, to all persons desiring them to stock public streams or ponds in this State, or they will be sent to any address on the parties paying the traveling expenses of a messenger to accompany them. For further particulars address SETH GREEN, Superintendent, Rochester, N. Y."

An Unprofitable Canal.—The old Wabash and Erie Canal, in Indiana, is to be sold for the benefit of the stockholders, who have $15,256,558 invested in the venerable and now useless ditch, the sale of which, it is thought, will not realize over two or three per cent. of that sum. A large part of the stock is held by foreign capitalists. The railroads destroyed the utility of the canal, which once did a large and paying business,

A Good State to Live In.—The State Treasurer of Iowa, in his recent report, shows that the expenses of the State last year were less than $1 for each inhabitant. Iowa is more exclusively agricultural than any other Western State, and has no very large cities. As a result its affairs are administered with greater economy than those of most other states, and the State debt is reduced to nothing.

RURAL BREVITIES.

MINNESOTA produced last year 28,000,000 bushels of wheat.

FARMERS in Tennessee are agitating for a "no fence" law.

THE winter is very mild in England as well as in this country.

ST. ALBANS, Vt., 2,598,000 lbs. of butter in 1875, a decrease of 200,000 lbs. from Jan. 1874.

THE United States completed in 1875 1,176 miles of railroad, against 1,731 miles in 1874, 3,456 in 1873, and 6,559 in 1872.

ANOTHER insect called the twister, has attacked the vineyards in Lombardy, and is said to be far more destructive than the renowned phylloxera.

AMONG the fresh vegetables now being sold in Covent Garden Market, London, are asparagus, truffles, lettuces, radishes, endive and cucumbers.

THE RURAL is a good paper to take and exhibit when you go to a meeting of your Farmers' Club, Grange, or other gathering,—and there is no great objection to your doing the same when you go to the store or corners of an afternoon or evening.

LAST year 880 races were run in this country, and the amount at stake was 330,000, besides a vast amount of private betting and gambling. Is *that* progress in the right direction?

WHEAT everywhere appears well. The open winter has been a mild one, and with frequent rains and occasional warm weather the stand is generally even better than in the fall.

READER, if you wish to aid the RURAL in its efforts to do good to the community, please show a copy to friends, whenever convenient, state its objects and value, and the consequent advantage of subscribing.

THE RURAL is a capital Valentine to send any rural, suburban, or even village or city friend, and will remind the recipient of the giver fifty-three times during the Centennial Year. You can send it, as a present, for only $2.15, postage paid.

THE "Excelsior Carpet Stretcher," advertised in this paper, is something needed wherever carpets are put down. A loose and badly-fitted carpet is an abomination, while a carpet that is stretched smoothly over the floor is pleasant to the eyes and feet. How to so fit, without injury to the carpet, seems to have been the aim of the manufacturer. We have one.

DON'T FORGET, please, that, as the RURAL is electrotyped, we can furnish back numbers to all new subscribers from Jan. 1,—even if a million copies are wanted—nor that there is yet time to start new clubs and secure liberal and valuable Premiums. Therefore, *Push on the Rural Column!*

BUSINESS NOTICES.

BRIDE & CO,
769 Broadway, N. Y., want agents for the best money-making article in the world. Send for particulars.

Cure for Cough or Cold.—As soon as there is the slightest uneasiness of the Chest, with difficulty of breathing, or indication of Cough, take during the day a few "BROWN'S BRONCHIAL TROCHES."

EVERY keg "**Phœnix Pure White Lead**" warranted *perfectly pure*—is white, fine, and has the very best body and covering properties.

OVER THE HILL.

THERE'S a face I must ever remember,
Though I may not behold it again
Through the golden haze of September,
Or the gray November rain;
A face that was joyous and tender
As the sea in its summer splendor;
And a smile that was clear and still
As the sunrise over the hill.

There were steps that flew to meet me,
Crushing the moss and the fern;
Blue eyes that brightened to greet me,
When others were cold and stern.
We crossed, in the sunny weather,
The blossoming fields together,
And rested beside the rill,
Coming over the hill.

Now the hill is barren and lonely,
And the sea is moaning beyond;
And the bleak winds answer only
To my heart's cry, wild and fond.
Pale asters, with dewdrops laden,
Do you weep for the blue-eyed maiden
Who sleeps in the graveyard chill,
In the graveyard over the hill?

No longer the sea wears the glory
That lighted its waves of old.
The moss and the fern heard a story
That never again can be told.
But I only seem to outlive her;
Green hights lie beyond the dark river:
There her step to my soul shall thrill,
Coming over the hill.

The Story-Teller.

MAX AND MARGARET.

A STORY OF LOVE AND DUTY.

BY VIOLET FULLER.

[Concluded from page 77, last No.]

CHAPTER II.

THE first of September came at last and the best rooms in Heathcote Chace were occupied by a lively set of guests, officers belonging to the Plungers, and young lawyers anxious for a vacation from Coke-upon-Lyttleton—all loaded with gun cases, desirous of showing their sporting prowess. They were nearly all acquainted with Count VON BERNSTEIN, and astonished that such a famous shot was not more anxious to display his skill. But the Count had the game in view; and as it was in a manner forbidden, the pursuit of it became more delightful. Poor MAX! He could not resist the temptation of lingering in MARGARET'S society—of sunning himself in the light of her sweet beauty. Day after day, after arraying himself in shooting costume and firing a few shots with the others, he would gradually fall behind and watch his opportunity to steal away from them. With a few birds in hand—for the Major, of course,—he would present himself at the cottage and ask MARGARET to read German, which reading would be prolonged until BERTIE made his appearance for luncheon, as he always kept up the habit of taking that meal with the Major. Of course the Count's state of mind was very patent to his friend, who only looked upon that state of things as temporary. "Poor fellow," he thought, "he may enjoy himself now; it will all be over when he returns to Germany and the Countess IDA. I only hope that MARGARET will not suffer."

Croquet parties and high teas were the order of the day at the Chace now, and BERTIE insisted on MARGARET making; her appearance under his care, for was she not his by right of possession? He intended to marry her some day, although he had not exactly put the question to her yet; still he knew she would have him when he chose. Of this BERTIE need not have been so sure, as the Plungers were fascinated, to a man, with this "Belle MARGUERITE," although, as her cousin's intentions regarding her were suspected, they admired her at a distance. The young ladies of the vicinity who were bidden to these festivities were equally smitten with the handsome, melancholy Count, but in vain. He had eyes but for one person, whose graceful, slender form, and fair, delicate high-bred face, formed a striking contrast to the full-blown beauties of the country maidens.

And MARGARET? She was in a dream; a dream of happiness and perfect content. This hero with the dark eyes and the wonderful voice—this brave, true heart,—was her *beau ideal* of all manly perfection. She did not look forward to the time when he should be gone; she lived in the beautiful, happy present.

One wet morning at the end of September, the Squire, who opened his mail bag at the breakfast table, handed the Count a letter at the receipt of which he seemed disturbed. "A love letter, Count?" said CECIL LASCELLES, a young officer, whose wit and person were alike heavy. "No," said MAX carelessly; "from my uncle, in Berlin. I fancy it contains my recall to Germany."

"Aw; sorry to lose you, my dear fellow."

"Nonsense," said BERTIE HEATHCOTE, who was exploring the depths of a game pie. "you can't go. What will the fair ladies of Belgravia do, without their best waltzer?"

"Oh, they will do without me very well," was the answer, as MAX rose from the table.

"Whither away?" said BERTIE. "You are not going out in this rain?"

"Only as far as the library, to read my letter."

He closed the door and reaching the library found it empty, and seated himself by the window to read his letter. It was from his uncle, the guardian of IDA VON LANSTEIN, entreating him to return to Germany and obey his mother's wish by marrying IDA, whose health was suffering on account of MAX'S neglect and disregard of his betrothal vow. "And," added the writer, "you are in honor bound to fulfill the contract. You must throw aside all personal feelings when the honor of the VON BERNSTEINS is at stake. You *must* do your duty, my MAX. I need say no more."

"No," thought MAX, "he need say no more. The honor of the VON BERNSTEINS will not suffer in my hands. But—it is all over." And he rose, and walked up and down the room for a moment, thinking what he should do. He stopped suddenly—his resolve was taken. "I will go," he said. "It is for the last time." He left the room and the house, and was soon making his way down the avenue, without either cloak or umbrella.

"Hallo," said CECIL LASCELLES, who saw him from the dining-room window; "the Count has gone out in the rain."

"Gone for a walk, I suppose," said BERTIE. "He is a strange fellow."

"Ain't he?" said CECIL. "He reminds me of CHARLES DE MOOR and the robber fellows in the play, with stilettos and such things, you know."

"Exactly, Cis, but I would not advise you to tell him so; he is a first-rate shot."

"I don't want to be a mark for him, I assure you. I have too great a regard for the Queen to rob her of one of her best officers."

"That's right," said BERTIE, laughing. "Let us go to the stables to inspect the horses and smoke a cigar." And as BERTIE smoked, he wondered what was taking place at the cottage, for of course MAX had gone there.

Poor fellow! When he reached the cottage, although it was still early, MARGARET was at work in her bright little drawing-room, where she had caused a fire to be made on account of the damp weather. "How wet you are," she said, as she rose to meet him.

"Am I?" he answered, looking at his coat sleeve on which the raindrops glistened.

"You must have this changed; papa will lend you one of his morning coats."

"It is nothing," he said hurriedly. "I have no time." But she insisted, and conducted him to the Major's room, from whence he emerged in a velvet morning coat, looking in MARGARET'S partial eyes like a handsome young artist. She was so full of sweet feminine cares for him, that it redoubled the distress which he felt at their approaching separation. But he must see her alone, and Major TREHERNE seemed to consider it his duty to remain in the room, while the precious moments were quickly passing. He must make an attempt to see her alone for the last time.

"Are we to have any German to-day?" he asked.

"O, yes, if you wish to be troubled with it. The books are here," she continued.

The Major rose, saying, "Well, I will see you after a while."

"He must stay until his coat is dry, papa," said MARGARET laughingly.

The Major departed and MARGARET, sitting down to a small table, began to prepare her books. But her teacher was silent, and looking up she saw that he was standing with his eyes fixed on the gray sky and falling rain. "He is not in spirits," she thought, with THEKLA, "'Wherefore is he not?' 'Count," she said, aloud, "are you ill?—what is the matter to-day?"

He turned. "Not ill in body, but ill in mind, Miss TREHERNE. This is our last lesson. I am going away."

"Going away!" MARGARET grew as pale as death and the book dropped from her hands. MAX dared not look at her. "I am sorry," she faltered.

"Sorry?" he repeated, looking at her and speaking with keen reproach in his voice. "Is that all?"

"What more can I say?" and she raised her eyes.

"Say!" he exclaimed, passionately, all his assumed firmness vanishing—"Say that you are sorry because you love me, MARGARET. You must know only too well that I love you." And he bent over the chair in which she sat, until his dark mustache almost touched the shining ripples of her chestnut hair. She was trembling intently. "MARGARET," he said softly, "you love me, do you not?" She bent her head in assent. "Then tell me so—say, 'MAX, I love you.'"

Thus adjured she raised her blue eyes to his face. "MAX," she said, tremulously, "MAX, I love you."

He bent, as if to take her to his heart, then suddenly left her side and walked the floor with hasty steps. At length he seemed to form a sudden resolve. "MARGARET," he said, coming towards her, "*Meine liebe*, you believe that I love you, do you not?—and yet I am going to place an eternal barrier between us." She gazed at in wonderingly. "See," and he took his uncle's letter from his pocket, "this will part us forever. Read it for yourself."

She took it, and as she read, started at the name of the Countess IDA. The letter fell from her hand, while two large tears trickled slowly down the pale cheeks. MAX was almost beside himself; he threw himself on his knees beside her. "MARGARET, darling of my heart! do not weep; it breaks my heart to see your tears."

She drew her hand from him, exclaiming with sudden passion, "You have broken *my* heart. You came to my peaceful home, where I had been so happy—you, the betrothed of another, to win my love and leave me. Oh, MAX," she said, breaking down, "why did you make me love you?"

His face flushed crimson. "MARGARET, listen to me," he said. "I place my fate in your hands; of my own will I will never leave you. When you hear all my story, you shall decide. Now," he continued after telling her all, "I have never loved IDA, poor child. I have never thought of her as my future wife. When I came here I thought myself free to choose, and as to loving you, who, my beloved, who could help it?"

MARGARET shook her head sadly as she listened to the pleading accents of that dear voice. She was gazing at the cold, gray sky, while a struggle was going on in her heart—a struggle between Love and Duty. She had the happiness of another in her grasp as well as her own. IDA must not be forgotten, and an angel with a flaming sword seemed to stand between her and love, driving her sternly forth into the cold, blank path of duty. MAX was watching her eagerly. With the almost divine light of self-abnegation in her blue eyes, she turned to him. "MAX," she said, and her sweet voice grew firm as she continued, "I am a soldier's daughter, and I have been taught that duty is first of all; everything else is secondary." He caught her hand imploringly. She took his gently in her own, and woman-like tried to console him. "MAX, beloved MAX, do not make my task too hard. You must go; you cannot break a sacred promise made to your dying mother. And this girl; she loves you of course; you must not break her heart. Remember, dearest, we must not live for ourselves alone, but for others, and the knowledge that we have made them happy will bring us consolation at the last."

"MARGARET," he said passionately, "you do not love me; you could not reason so coldly if you did."

"Not love you? O, MAX, I love you too well to permit you to act dishonestly for my sake."

"Would we had never met," said he bitterly.

"O do not say so; think rather of what our favorite THEKLA said to her MAX, and let we say to mine, '*Wir haben gelebt und geliebt*'—is not that enough?"

"MARGARET, you are an angel," said her lover, as he stooped and passionately kissed the little cold hand that lay in her lap.

"No angel, but a weak woman, trying to do her duty."

They had both risen, and she was standing near him, her whole frame trembling with uncontrollable agitation. Before she was aware of what he was about to do, MAX'S arms were round her, and she was pressed, strained rather, to his throbbing heart. "Forgive me," he said, as he held her thus. "It is the first, the last time. Farewell, my love, my darling. I go only because you have decided that it is best." And, with one long, passionate pressure on her lips, he released her and was gone.

The struggle between love and duty was over, and "woe to the conquered." MARGARET stood where he had left her, her breath coming with great, deep sobs. She felt rather than saw her way to a chair, on which she sank down with a low moan of agony. "Farewell," she murmured; "ah, yes, it is indeed an eternal farewell. She sat with clasped hands and tearless eyes, taking no note of time, until her father entered the room. "Where is the Count?"

"He has gone."

"Gone! I thought he was going to stay for luncheon. It is time, is it not?"

"Yes; I will see about it."

She stood a moment in the hall to collect herself. How could she go through the meal and talk in an unrestrained manner to her father, while her heart was breaking? But she had to repress her feelings and strive to seem unconcerned as she spoke of the Count's departure. "*Soffie e taci*" is the motto of many a woman's life, and it became that of MARGARET'S.

MAX went mechanically along the Heathcote avenue, after his interview, utterly regardless of the pouring rain and of the fact that he still wore the coat of Major TREHERNE. He reached the house and his room unseen, and at length perceiving the saturated condition of the coat, rang for his servant, had it dried and returned with a note of apology and farewell. There was no message for MARGARET, but she would understand the omission,

BERTIE HEATHCOTE was sincerely sorry to lose his friend. "You will marry soon, I suppose, and bring your wife back on a wedding tour."

"I have no present intention of marrying," was the answer. MARGARET'S name was never mentioned between them. So MAX bade adieu to the cherished spot where the romance of his life had begun and ended. "Farewell, dear England and happiness," he said, as he stood on the deck of the steamer and gazed with mournful eyes on the white cliffs of Albion, as they grew more and more distant to his view.

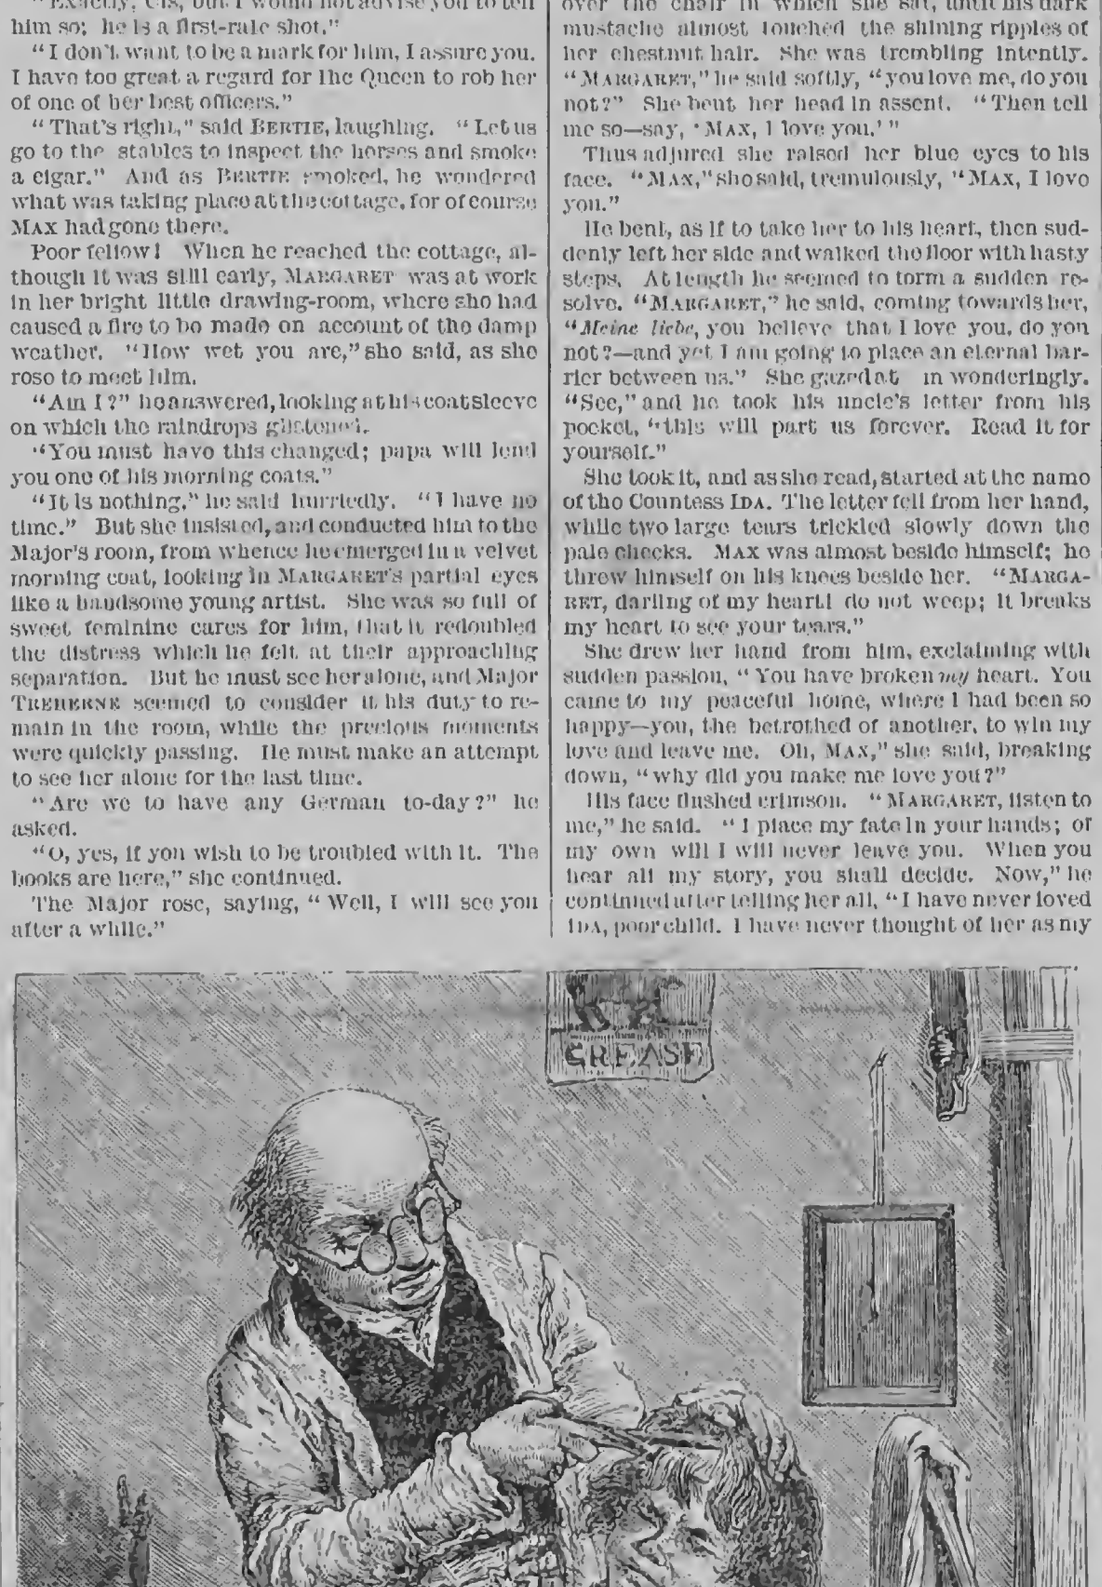
BERTIE came and went to the cottage in his usual fashion. He noticed his cousin's unusual paleness and apathy, but did not comment on it, as he suspected the cause. He was more in love with her than he cared to own, and now that he feared to lose her, she seemed more beautiful than ever. Besides, CECIL LASCELLES was evidently smitten, and as he was heir to a baronetcy, he loomed up formidably as a rival. So BERTIE determined to put his fate to the test—and lost! MARGARET refused him gently but decidedly. He was terribly disappointed. "It is the fault of that German," he said, pulling fiercely at his amber mustache; "I wish I had never brought him here."

MARGARET flushed crimson. "It would have made no difference. I have always loved you dearly as a brother, BERTIE, nothing more."

"It would have grown to something more in time, and you know how my father wishes our marriage, MARGARET."

"Dear BERTIE," she said, while her blue eyes filled with tears, "I am so sorry it cannot be as you wish; but you will find some one more worthy of you than I."

He was touched by her distress. "Tell me one thing, MARGARET, and I will trouble you no more. Do you care for VON BERNSTEIN?" She grew pale



THE VILLAGE BARBER.

to the lips, but bent her head in silence. "Ah! and he loves you, I know. Poor fellow, it is a hard fate that separates you two. Well, good-by; I am off to-morrow. I would have tried to make you happy, dear, but one can't force one's affections." He kissed her hand and hurried down the gravel path at a quick pace. "So that's over. Well, if I can't have her, neither can LASCELLES, great booby." And comforting himself thus, he smoked a cigar under the shade of the grand old trees, which would one day be his own, and thought that for such an estate a mistress could easily be found. "If she be not fair for me, what care I how fair she be?" he sang, and thus showed that he was not utterly broken-hearted.

BERTIE and the remaining guests took their departure the next morning, and the Squire was alone, save for the visits of the Major and MARGARET, who was more than ever sweet and gentle with the old man, for she know how bitterly she had disappointed him.

Thus the time wore on; winter came and went, and MARGARET was almost entirely alone, save for the companionship of two old men, with their memories of the past. And she had the memory of her love and grief, but she strove against vain repinings; only the longing to see MAX came over her occasionally with irrepressible power. She had never heard of him since he left Heathcote; and BERTIE, who had not been at home for Christmas, never spoke of him in his letters. At length the war cloud which had been hovering over Germany for so long, burst in fire and smoke, and one day BERTIE arrived at the Chace with the news of war between Prussia and Austria. "There's a chance for VON BERNSTEIN," he remarked to MARGARET.

She turned pale. "Have you heard from him?" she asked.

"O, yes; did not I write you? He married some time ago. But I am sure he will return to his old profession. He always wished for another war. It is a bore though, just now, for I wanted to persuade the Major and my father to take you for a trip on the continent this autumn; would you not like it?"

Like it, and MAX married and about to engage in useless bloodshed! It was too terrible.

Events progressed rapidly however, and the war was over in a few months, and BISMARK, the greatest statesman in Europe, settled the affairs of Germany on a peaceful footing for a time at least.

In the following autumn a group of travelers—consisting of a fair, chestnut-haired girl, a tall, soldierly young fellow, with blue eyes and a drooping amber mustache, and two old gentlemen, evidently English—stood one afternoon in the Kursaal at Baden. The lady with her delicate, high-bred beauty, was the object of many admiring glances from a group of Prussian officers who stood near. "Where is MAX?" asked one of them of his companion. "VON BERNSTEIN?—he was here just now."

The English girl blushed as these words fell on her ear, and her hand trembled as it rested on the arm of her escort.

"Is his health improving?" asked the officer who had just spoken.

"I believe it is, but the ball still troubles him."

"Ah," said the other; "where was he wounded?"

"In the chest; that is his souvenir of Konigratz—one that will last him all his life—but here he comes."

MARGARET TREHERNE—it was she who had been listening breathlessly to this conversation—turned away her head. She dared not look at the approaching figure. "Ah, WALDEMAR, have you been waiting long?" said the deep, rich voice whose every tone she knew and loved.

"Good heavens," said Captain HEATHCOTE, as he too heard the voice, "is not that VON BERNSTEIN? To be sure it is. MAX, my dear fellow," he exclaimed, dropping MARGARET'S arm and rushing forward with outstretched hand, "how delighted I am to see you again; and what a hero you are, my brave old MAX."

MAX turned, his whole face radiant with joy at the sound of the cheery English voice.

"BERTIE HEATHCOTE! Is it possible!" but catching sight of MARGARET, who stood with averted head, "Mrs. HEATHCOTE is with you, I perceive."

"Mrs. who? Why, it's my cousin MARGARET; you have not forgotten her. I am not married."

MAX smiled, and pressed BERTIE'S hand before advancing timidly to MARGARET who, with wildly beating heart, awaited his approach. He bent his handsome head before her. "Miss TREHERNE, may I beg leave to recall a friend to your remembrance?"

She raised her eyes. "Count VON BERNSTEIN, I am glad to see you again," and she held out a trembling hand, which was instantly taken in a warm and tender clasp. "How handsome he is," she thought as he left her a moment to shake hands with her father and the Squire. But where was his wife? Would he speak of her, or ought she to do so first?

At length he returned and offered her his arm for a promenade. The band was playing outside the Kursaal, and the gentlemen were all in sight. MARGARET'S hand trembled violently, and the arm on which she leaned was trembling too. They walked up and down under the lime trees for a time in silence, watching the groups of promenaders and listening to the band, which was playing one of STRAUSS' delicious waltzes—waltzes which are the very poetry of sound, full of a tender, melancholy longing after unattainable happiness.

"How delightful this is!" said MAX at length.

"Yes, very different from our quiet Heathcote," she answered.

"Heathcote was a Paradise! How much I have suffered since I left Heathcote; and you, MARGARET?" The last word came out lingeringly, fondly. MARGARET was silent. "They told me you were married to Captain HEATHCOTE," he said.

"Oh, no," she said quickly.

"And you are free then, my beautiful English rose?" and he looked with rapture at the sweet, down-cast face. "And I am also free, and rich."

She looked up. "And your wife?"

"My wife, my poor IDA, died soon after our marriage, leaving me all her fortune. She had a noble, generous heart. I would have sought you, MARGARET, but I thought you were married, and when the war broke out, threw myself heart and soul into the struggle."

"And you were wounded, MAX?"

"Yes, but not dangerously. It was for the Fatherland, and now, now that I have done my duty, I can claim my love—for MARGARET, I have never ceased to love you."

"Nor I you, MAX," she answered softly.

He pressed the little hand resting on his arm closely to his side. It was the only demonstration of affection he could make, surrounded as they were by the gay throng; but MARGARET could feel the strong, quick throbs of his heart, and her own was beating in unison.

MAX and MARGARET were happy at last, as they deserved to be, and no one was more delighted than BERTIE, although sorry to part with his cousin and her father, who took up their residence at the Schloss von Bernstein, now rebuilt and made a fitting home for our pure English pearl. And so we leave them, happy in the consciousness of duty richly fulfilled.

BERTIE HEATHCOTE married the fair daughter of an English baronet, and was as contented as possible in his own good-humored way, but the Squire never became quite reconciled to the loss of MARGARET.

NO TIME FOR ANYTHING.

THE great difficulty in this country is that we have no time for anything. The very walk of an American suggests that he is in a hurry. An Englishman buttons his coat and gloves, and goes to business as deliberately as he goes to church. An American business man flies after the car, struggling with his coat sleeves as he runs, plunges in headforemost, and plunges out at the end without regard to his neck. Chief among our accidents stand those which occur because people will jump upon flying trains and departing boats. To wait ten minutes is something not to be thought of.

Dinner is not eaten, it is swallowed whole; and when one comes to the dessert he finds that the fruit was picked before it was ripe. Everything is hurried through, from the building of a house to the curing of a ham. The women who work on sewing machines stop before they come to the end of the seam. The dressmaker sends home your dress with basting threads in it, and no loops to hang it up by. There is none of the slow, sure completeness of the old world about anything, and even fortunes are made in a hurry, and lost in the same way. If any man we know is getting rich by the slow and patient process of saving, be sure that he was not born upon this continent. Yet people live as long here as they do anywhere else, and the days are the same length. Why is it that we have no time for anything?

The Literary World.

NEW PUBLICATIONS.

Through and Through the Tropics.—Thirty Thousand Miles of Travel in Oceanica, Australasia and India. By FRANK VINCENT, JR., author of "The Land of the White Elephant." [12mo.—pp. 334. New York: Harper & Bro's.

IN a comparatively small volume our author gives an interesting, and most entertaining and instructive, narrative of his travels and observations to and in the countries named, with glances also at Terra del Fuego and California. Omitting all circumlocution and buncomb, the author imparts the gist of his experiences by sea and land in a direct, natural style—giving the salient points prominence, and rendering them interesting, without burdening the reader with unimportant details or imaginary speculations. The work is indeed a most enjoyable one, by a close observer, who is evidently a man of culture and cosmopolitan experience. The volume is a fitting companion or follower of Mr. VINCENT'S former work, "The Land of the White Elephant,"—which was most favorably received, both here and abroad, and translated into several languages—and is commended to all who would obtain much interesting information in compact form and without brain weariness.

The Sunny Side. A Book of Songs for Sunday-School and Home. By CHARLES W. WENDTE and H. S. PERKINS. New York: Wm. A. Pond & Co., No. 547 Broadway. [138 p. Price, 35 cents.]

WE have rarely had occasion to notice a book that is more perfectly adapted to its purpose than this. The poetry is mostly of a high order, and the music, while simple, as it ought to be for children, is not commonplace, being from the pens of some of our best-known composers. It is a thoroughly good book, and will be popular if the publishers advertise it properly.

Athenagoras. Edited for Schools and Colleges by F. A. MARCH, D. D., with Explanatory Notes by W. B. OWEN, A. M., Adjunct Professor of Christian Greek in Lafayette College. [12mo.—pp. 262.] New York: Harper & Brothers.

THIS is Vol. IV. of the "Douglass Series of Christian Greek and Latin Writers"—a course of text books designed to replace the works in our colleges and high schools now mostly occupied by the so-called pagan authors. The volumes of the series already published include "Latin Hymns," "Eusebius," the first book of his "Ecclesiastical History;" "Tertullian," select works; and the present—"Athenagoras," plus "Plea for Christians," and "Resurrection of the Dead." Two more of the series are in preparation—"Justin Martyr" and "St. Augustine," the former edited by Prof. GILDERSLEEVE of the University of Va., and the latter by Prof. CROWELL of Amherst College.

BOOKS RECEIVED.

AMONG the most readable works of fiction issued the present season are the three following, included in the "Library of Select Novels" published by HARPER & BROTHERS:

Owen Gwynne's Great Work. By the author of "The Story of Wandering Willie," "Conrad the Squirrel," &c. [The authorship of this delightful story is attributed to Lady AUGUSTA NOEL, daughter of Lord Albemarle.]

Victor and Vanquished. By MARY CECIL HAY, author of "Old Middleton's Money," "The Squire's Legacy," &c.

Halves. By JAMES PAYN, author of "Walter's Word," "One of the Family," "Won—Not Wooed," &c.

The above are handsomely issued, in paper covers, at 50 cents each.

T. B. PETERSON &. BROS., of Phila., send us the following cheap novels:

George; Or, The Planter of the Isle of France. By ALEX. DUMAS.

Felino de Chambure; Or, The Female Fiend. By ALEX. DUMAS.

The Twin Lieutenants; Or, The Soldier's Bride. By ALEX. DUMAS.

My Husband's First Love, (Gina Montani.) By Mrs. HENRY WOOD.

NEW MUSIC.

WE have received from WM. A. POND & Co., No. 547 Broadway and 39 Union Square, N. Y.:

"Fourth Company Quickstep," by C. S. GRAFULLA—A bold, stirring melody. "Evening Song,"—A Romanza for Piano, by HENRY KLEBER. "Down Among de Sugar Cane"—A Character Song, by ARTHUR D. BLAKE. "Lord, Whom Winds and Waves Obey"—Anthem for four voices, by H. MILLARD—A very pleasing and effective piece,—good to have and to hear. "Saviour Divine, We Bend Before Thee," "My Faith Looks Up to Thee," "Jesu, Lover of My Soul"—Three excellent sacred quartettes, by S. B. WHITELY. "Verlegenheit"—An easy song, with German and English words. It is issued in D flat for Soprano, and in B flat for Baritone or Alto.

LITERARY NOTES.

IN Germany there are now two magazines devoted chiefly to poetry.

THE United States sent $95,678 worth of printed books to England during the fiscal year 1874-75.

PROF. HARTT of Cornell University writes the article "Brazil" for the "Encyclopedia Brittanica."

ST. GEORGE MILVART'S new work, "Lessons from Nature, as Manifested in Mind and Manner," is just ready in London.

THE work on Libraries, to be issued by the Bureau of Education, will be of much wider scope than was at first contemplated.

THE President (Stearns) of Amherst says that the modern system of education, embracing a multiplicity of topics, is injurious to the memory.

GEN. READ, our Minister to Greece, is said to be writing a history of that country. It will be the fullest and most complete history of Greece ever published.

THE Rev. G. R. Crooks, D. D., is hard at work upon the "Life and Letters of Rev. Dr. John McClintock," but the volume will not be issued for some months.

THE Rev. J. S. C. Abbott will add another biography—probably one of Franklin—to complete his series of "American Pioneers and Patriots," in twelve volumes.

JACOB FREI, the popular Swiss novelist, died in Berne on the 30th of December. For many years he was one of the foremost writers of romantic literature in Switzerland.

AN essay by the late George Grote on "Aristotle as a Moral Teacher," has been found among the historian's papers, and is announced for publication, with other posthumous papers.

THE King of Bavaria has bestowed the knighthood of the Order of Maximilian on Professor Max Muller. This Order is confined to a limited number of men distinguished in science and art.

THE following Americans have been elected corresponding members of the Imperial Academy of Sciences in St. Petersburg: Prof. Newcomb of the Naval Observatory at Washington; Prof. Gould of the South American Argentine Republic, and Prof. Whitney of Yale College.

A NEW work on "Burmah and its Inhabitants," by Charles Gordon, is announced in London. In this latter work the ethnology, zoology and botany of the country will be treated of, and many traits and peculiarities of the people of this comparatively unknown land are to be given.

"OUR Poetical Favorites—Second Series"—being a collection of the Best Minor Poems in the English Language, by Prof. A. C. Kendrick of the University of Rochester, has just been published by Sheldon & Co. of this city. The first series proved very popular, and the present will probably receive like favor.

Sabbath Reading.

WHILE BELOW.

SHARING mingled joy and sorrow,
Hope to-day and fear to-morrow,
Strength of heart we needs must borrow,
While below.

Sunshine with the storm is blended;
O'er the flood the bow is bended;
Trusting souls shall be befriended
While below.

Mid the tempest blooms the willow;
Sings the sailor on the billow;
Hope of heaven may be our pillow,
While below.

Though the way seem dark before us,
Oft the clouds are rifted o'er us,
And we hear the angel chorus
While below.

Love has never vainly striven;
Needed strength is ever given;
Dawns on us the light of heaven,
While below.

From the Captain of salvation,
Faith shall have its coronation;
Shout we then in exultation,
While below.

HONESTY—A BRIEF SERMON.

EVERYBODY says that everybody should be honest; but everybody is not honest either abroad or at home. That we should be honest in our trade, weights and measures, dealing with our neighbors and with strangers is also clearly right. That a strong principle of integrity should govern us—is just what every man not only admits but believes and contends for. There is no such thing as being too honest. Honesty is a virtue better than gold, richer than rubies, more precious than gems and costly trappings. It is much richer adornment for manhood or womanhood than wealth can purchase or place secure. To be honest is to be like a child and like an angel, and Christ said of little children, of such as is the kingdom of Heaven. But we wish to write a word—a strong word—in behalf of honesty.

There are many people who are honest away from home. They make home promises only to break them. As husbands they make a thousand and one promises to their wives, and hint a thousand good things and raise many pleasant expectations they never seem to think of again. As wives, they practice a thousand little deceits, equivocate many times, when straightforward honesty was just the thing required. As parents, they conceal, go around the truth, deceive, and often actually falsify to their children, when the truth is always better, always the best. The children see their parents' double-dealings, see their want of integrity, and learn to cheat, deceive and equivocate. The child is too often a chip off the old block.

THOUGHTS FOR THINKERS.

HOPE, though valuable, is not always a sure antidote to misfortune.

A GOOD conscience seats the mind on a rich throne of lasting quiet.

VIRTUE is the greatest ornament, and good sense the best equipage.

IN your worst estate, hope; in your best estate, fear; in every estate be circumspect.

IN the Christian race all patient runners win, and in the Christian battle all who endure to the end are victors.

LET the fire be always burning brightly and ardently on your own altar, wherever it may blaze or blink besides.

I KNOW of but two beautiful things:—the starry heavens above my head and the sense of duty within my heart.—*Kant.*

HE that has tasted all the bitterness of evil fears to commit it, and he that hath felt the sweetness of mercy will fear to offend it.

EVERY day brings its own duties and carries them along with it; and they are waves broken on the shore, many like them coming after.

PEACE is the flowing of a brook, but joy is the dashing of the cataract when the brook is filled, bursts its banks and rushes down the rocks.—*Spurgeon.*

IT is never too late with us so long as we are still aware of our faults and bear them patiently—so long as aspirations eager for conquest stir within us.

WE are all sculptors and painters, and our material is our own flesh and blood and bones. Any nobleness begins at once to refine a man's features, and meanness or sensuality to imbrute them.—*Thoreau.*

HOPE is the last thing that dies in man, and though it be exceedingly deceitful, yet it is of this good use to us, that while we are traveling through life it conducts us in an easier and more pleasant way to our journey's end.—*Rochefoucauld.*

IF God, our Heavenly Father, seems distant and uninviting to us, it is because, like the prodigal son, we have taken our portion of goods and gone into a far country to set up for ourselves, that we may foolishly enjoy, rather than reverently serve.

AS the fountain finds its expression in overflowing, as a river in rushing to the infinite main, as trees in bursting into life and blossom in the spring-tide, so God feels it his joy to give liberally, and to give above all we ask, or think, or desire, for Christ's sake.—*Cumming.*

Ladies' Portfolio.

RENUNCIATION.

BY C. N. C.

TAKE back the crown of flowers,
And on some other brow
Their beauty place until they learn
What 'tis that fails me now.

Take back the crown of flowers;
Henceforth I will none wear,
Unless a wreath of plain green leaves
Replace these so fair.

Take back the crown of flowers;
They are beautiful I know—
Sweet city buds, and purple blooms,
And roses white as snow.

Take back the crown of flowers,
And give me leaves that brave
The summer's heat, the winter's cold,
Nor find an early grave.

I bow my head at last,
And lay the bright gift down—
For I have learned there are better things
Than flowers for a crown.

MR. AND MRS. JOHNS.

A Sketch for Some Wives' Husbands.

BY PERSIE VERE.

"I DON'T know how it is," said Mr. JOHNS, drawing on his boots by the kitchen stove.

"Don't know how what is?" inquired his wife.

"Why, Mr. PALMER'S family must be dreadfully expensive. There he has seventeen hundred dollars a year, and he uses it right up, they say. But they keep a hired girl all the time. Then they have three or four fires going through the winter, and I dare say ever so many needless expenses."

"Well, I don't know, either," responded Mrs. JOHNS, thoughtfully, wiping and setting away her breakfast dishes. "I suppose they think 'tis wisest to take the good of what they have *now*. The comfort they get from the seventeen hundred dollars is sure, and life isn't."

"Nor health, either," broke in Mr. JOHNS. "If they should be sick, or he should die, what would they do? There would be nothing but his life insurance. For my part, I don't feel like taking my ease or going into luxuries till we have enough to support us in the most extreme case, and I think every man ought to act from this principle. Then Mr. PALMER takes ten papers of some kind; and he carried home five new, large books at Christmas."

Mrs. JOHNS' mouth fairly watered at this, as she said, "It must be so nice to have plenty to read, and time too. Oh, I should so like to be able to ask in our friends often, and let our children have pleasant times at home, now, before they are grown up and away. But as it is, I am so hurried I can't attend to any thing that can be left out. If I had a good, strong girl to help me——"

This touched Mr. JOHNS in a sore spot. "You wouldn't get along any better than you do now. There would be the girl to wash for, and cook for, and wait on, and you'd think then you must do everything yourself to have it right. Work is good for folks. I feel ever so much better when I am steady at work, and you look healthier than a dozen women I know of who keep hired girls."

Mrs. JOHNS made no reply. It was best not to, for the matter had been discussed times enough before, and nothing was to be gained by going over it again; but her face grew forthwith into a study for the curious, with its mixture of hopelessness and self-reliance. She had worked from week's end to week's end many years through, hoping and hoping that as means increased, the farm was paid for and the house built, the time would come when she could live easier. Now she was gradually making up her mind that for them it would always be work, work—getting together for others to scatter; that all the beautiful, softening fruits of home leisure must be foregone. She kept thinking to herself, if only her husband felt as she did about it, they might all have more time and more comfort now. But Mr. JOHNS, though he disclaimed the idea, was fast getting into the way of working from mere habit. To be sure, he said it was necessary that he should save and work hard, but he certainly had more good property now than he used to think he must have in order to feel easy about common expenses, still he did not feel easy about them.

This was not strange, perhaps. He had started out from a home of poverty to make a way for himself, when farm produce was a drug, and the poor producer smiled humbly if his doctor, or lawyer, or merchant deigned to take a few bushels of wheat or oats, at any price. Money was hard to get, and Mr. JOHNS early learned not to part with it lightly when once in hand. Now it had become second nature. He was not at all pinching about great bargains; he could keep the "main chance" in sight, and large sums were cheerfully paid out where large returns were sure. But when it came to handing over money for the countless little needs of the household, he was disposed to cut down and pinch to smallest point. Then, too, he had found that his wife, though she was not a very stout built body, could manage a great deal of work; that she could turn and twist and contrive, and with very little have herself and family presentable. He often said that when one had little, little would be spent, whereas abundance tempted to prodigality!

So it was that when, after ten years' hard work by both husband and wife, they found themselves in a good home, with landed investments sufficient to fall back on in case of necessity, he still felt like pinching. The habit was formed, and it was hard to see the money go for trifles. If ever his wife had a dollar of her own, it was earned by doing some extra hard job herself, like whitewashing, and papering walls, instead of hiring a man to do it. With all her multiplied cares, she did now, as at first, her own washing and house cleaning, though often with as much weariness and exhaustion as would make her tremble for future health and life even. When sinking down to rest a moment, in the midst of these labors, hard questions would come up. Why did she work so? How long could she endure it? What would become of her poor children if she wore herself out with this rough work?—and who would ever appreciate it? Then would she resolve never, never to go into such work again. Still she did undertake it again and again, because she wanted the money *so much*, and if she saved it she might have it; but she did not near always get it. She was unwise, and she knew it herself. While there is such a cry about the extravagance of money, multitudes of them are doing the same thing that Mrs. JOHNS did—working and striving continually to save, and taking the saving out of their own lives.

Mr. JOHNS never had a thought that he was unkind or unjust to his wife, but he had that belief, chronic among so many farmers, that out-door work is the means and end of life—and while they want all the comforts that flow from a proper performance of housework—they seem never to think that any money is earned by carrying on the endless and tiresome routine, and that all money spent about it is lost. Little by little the farm is paid for, crops are better, and there is money to buy another piece of land, but there is so often a sore lack for the little needs of home. Both husband and wife have formed habits, during the long struggle with debt, which are hard to break up. It may be comparatively easy for him, with machines and hired help, to slip his own hands out of the hardest work, but it does not come so easy for him to see his money frittered in small things about the house, nor for his wife to stop doing and saving all she can so as not to ask for money. This real enslavement of woman—mothers of families—to heavy, ceaseless toil, is a great lowering element among our rural population. A woman of ambition and inbred refinement, cannot keep up always stepping on a treadwheel. She must feel, after awhile, that there is bottom under her feet, that some of the proceeds of her labor will come into her own hands during her own lifetime, and help to make it easier and pleasanter, or she will lose heart, and become that saddest of sights, a broken down mother.

That very night, while Mr. JOHNS was buttoning up his overcoat to go to town, Mrs. JOHNS, after dreading it some time, began to tell him of some things they must have.

He replied: "This is the way it always is, something wanting continually. I can't keep any money about me. I took twenty dollars from the bank this morning, and now I haven't enough to get the nails I want to use to-morrow."

In that moment Mrs. JOHNS made up her mind that she would not send for the ten cent bunch of braid, but would bind the skirt with strips of cloth instead—a great deal more work and not so lasting. So it was always—saving ten cents here and five cents there, at the expense of much time and worry, so that she was continually in a hurry. Sitting sewing through the long evening—making a new coat out of an old one—her thoughts were busy, as they were very much of late, trying to contrive ways and means to earn money herself.

FOR AND ABOUT WOMEN.

QUEEN VICTORIA will open the coming session of Parliament in person.

IT is said that Miss Braddon, the authoress, is coming to this country on a reading tour.

CHARLOTTE CUSHMAN is said to be writing a book of personal reminiscences of the stage.

MRS. M. A. N. POLLARD, wife of the Confederate historian, is in California, and proposes soon to give readings there.

MRS. ELLERY BOND of Lewiston, Me., a carpet weaver, has woven, during the past three and a half years, over 3,500 yards of carpeting.

MRS VAN COTT has transferred her labors as an evangelist to Newark, N. J., where the Clinton Street Methodist Church was filled at her first meeting.

THE first fruits of leap year shine forth in the case of Miss BELLE HARPER of Fairhaven, W. Va., who shot a man because he refused her offer of marriage.

CAMILLA URSO has a violin, more than 200 years old, valued at $2,800, and another, made about 1790, worth $1,300. She uses both at her concerts, changing with the style of music she is to play.

MRS. ELIZABETH REUTER is the oldest citizen of Baltimore. She was born in Luxemburg, Europe, and is said to have been 109 on Christmas morning, but is still able to get about and superintend the house-work.

MRS. HARRIET E. TAPPAN of Claremont, N. H., left in her will about $30,500 to furnish prizes for the best scholarships in the Stevens High School, and in aid of poor children attending common schools in town.

MRS. EMILY TURMAN of Frankfort, Ky., has presented the Christian or Campbellite congregation at Augusta, Ga., with a completely furnished church and parsonage, which she has erected at a cost of $101,850.

IN Newark, the other day, a fashionable mother said to the family physician in the presence of her three giggling, frivolous daughters: "Doctor, how can we improve our girls?" "By improving the mothers," was the gruff reply.

Reading for the Young.

PRETTY IS THAT PRETTY DOES.

THE spider wears a plain brown dress,
And she is a steady spinner;
To see her, quiet as a mouse,
Going about her silver house,
You would never, never guess
The way she gets her dinner;

She looks as if no thought of ill
In all her life had stirred her,
But while she moves with careful tread
And while she spins her silken thread,
She is planning, planning, planning still
The way to do some murder.

My child, who reads this simple lay
With eyes downcast and tender,
Remember the old proverb says
That pretty is which pretty does,
And that worth does not go nor stay
For poverty nor splendor;

'Tis not the house, and not the dress,
That makes the saint or sinner,
To see the spider sit and spin,
Shut with her webs of silver in,
You would never, never guess
The way she gets her dinner. [*Alice Cary.*

LETTERS FROM BOYS AND GIRLS.

From a Canadian Rural Boy.

DEAR EDITOR:—I see in the last RURAL that the girls are pitching into YOUNG TOM since he threw that last "bomb," as they call it, into their camp. I am afraid they will keep him from writing again, but I hope they won't, as I like to read his letters. There was very cold weather here last week; the thermometer stood 10 deg. below zero. Although there is not much snow yet, there is good sleighing just now. The farmers around here have been threshing their grain since the ground froze up. In some places wheat turned out splendid, but most of the wheat that was harvested late is sprouted from the wet weather. There is a merchant in a village near here who is buying all the sprouted wheat he can get at forty cents a bushel. I see that there are a good many getting up clubs for the RURAL. I would be one of them, but no one can get up a club here. I asked two or three if they would subscribe; some of them said they could not afford it, and others that they knew too much about farming already, without taking a paper, but the whole of them can read papers if they get another to pay for them. But I don't care how much *they* know, *we* will be one of the million subscribers. Perhaps some of those who could not afford to take a paper will wish they had taken the RURAL, when they find out what the Bohemian oats are. The agents were all around here, but they did not come to us, as they must have heard we were taking the RURAL and were prepared for them. There was one man not far from here that bought over $10 worth of it. I think in a few years we will hear of that man's suicide.—ROBERT H. C., *Wellesley, Ont., Dec.* 19.

From an Orange Co. (N. Y.) Girl.

DEAR RURAL:—I am a farmer's daughter and satisfied with the title. I love to read the RURAL, especially the Letters from the Boys and Girls. This is my first letter to the RURAL. I will write a few thoughts, but hardly expect to see them in print. I felt very much out of patience and ashamed when I read YOUNG TOM'S last letter. I agree with the Iowa Girl in saying that girls are no worse about the fashions than the boys. Indeed, I would like to shake hands and explain to him a little, and see if we could not discuss any subjects without referring to the fashions. I do not think that the fairer sex need to be criticised any more than the other sex. You need not detest their company so much, and you will form a better opinion of them, I think. What is your opinion of dancing? I believe in dressing and acting in the most becoming manner, regardless of the latest style or mode. I would like to hear from the Iowa School Girl very much, and hope for a description of the State, and I hope to hear soon from YOUNG TOM. If I see this in your paper, I will write a letter and tell you something about the place in which I live.—HATTIE A.

From a Rochester Girl.

DEAR GIRLS:—I want you all to see the picture I have carried in my mind since YOUNG TOM threw that shell into our camp. Picture to yourselves a young man six feet tall, with hair the color of a last year's summer squash, mustache ditto—hairs few and far between—pea green eyes, sweet little nose, mouth and ears to match, any color of complexion to suit the taste. Now, TOM, take a little advice, will you not, and oblige the rural fair sex by mounting one of the many lofty peaks that tower around you, and stay till called for by one of the same? Take a bag of beans with you (that is, if you would be so condescending and obliging as to give us the honor of serving you). Now, THOMAS, "right about face," and send double charges in all directions. TOM the brave! If I see a wild-looking chap coming north, with his hair pointing every way, and nose upward, I will run for dear life.—DELL. B. W., *Rochester, N. Y.*

From a Michigan Boy.

MR. EDITOR:—As I have read the RURAL for many years and the letters from the little folks, and also written one which you were so kind as to publish, I will try one more and hope that you will give this. I read a letter from a New York Boy in RURAL of Dec. 18; how he dug 225 bushels of potatoes in ten hours with a potato hook, and that he dug them from 7,000 hills. This looks to me like a big day's work, and so I would like to have the New York Boy read this, for I have lived in a country where they raise potatoes for their main crop, and some plant as high as forty acres, and no one there ever dug 225 bushels in one day. Now take the 7,000 hills, which, if they stood three feet apart, would cover over an acre and a quarter of ground—for this is about the way potatoes are planted in these parts—and he would have to dig over twenty-two bushels an hour for ten hours, which is lively work for Michigan boys; but I think that there is a mistake somewhere. I have not seen anything in the RURAL lately about the Alfalfa clover, and so I will say a word in favor of it. I sowed a small patch on poor sand, where common clover would not grow, but the Alfalfa came up and grew good. Some of it got two feet high the first summer. It stood the last winter well (and it was a hard winter), and grew astonishingly last summer. I recommend it to all.—M. W. STEVENS, *Tyrone, Liv. Co., Mich.*

From a Wide-Awake Illinois Girl.

DEAR EDITOR:—We have taken the RURAL for many years. I live on a farm. This is my first letter, and I hope you will accept me as a Cousin. We have been keeping a dairy of forty-five cows the past summer. I have milked eighteen cows a few times, but usually milk from eight to twelve. We have sold all but four, and I don't have to milk now. I am going to school; study Reading, History, Arithmetic, Spelling and Writing, and have to speak pieces every Friday. I can harness up a team and take a ride. I drove on a reaper last summer, and gathered over a half bushel of hazel nuts. I have a piano and can play a few pieces. Good-by.—WILD CRAB.

From a "My Maryland" Boy.

DEAR RURAL:—As so many boys and girls are writing to you, I thought if you would allow me space I would write a short letter to tell you how well I am pleased with the RURAL. I do not take the paper myself, but my brother does: he has taken it nearly three years. I think the RURAL is a very useful paper, and that no farmer ought to be without it. As most of the boys and girls tell their ages I will tell mine. I am fourteen years old. I like farming very much, and I don't think we could get along very well without the dear RURAL.—J. L. E., *Spring Garden, Carroll Co., Md.*

From a Connecticut School Girl,

DEAR RURAL:—After reading so many boys' and girls' letters I concluded to contribute my share. The "Dear Old RURAL" seems like a friend to me, and in my estimation grows better every year, and I would rather give up all the papers we take than the RURAL. I am in Danbury at school now, and my favorite pursuits are Music and Drawing. I would like to hear from some of the Cousins who are interested in those branches. I am studying Latin, which I like very much. The answer I find to Cross-word Enigma No. 3 is "Lion." If my letter meets with success perhaps I will write again, and until then good-by.—FAIRY BELLE, *Danbury, Conn., Jan.*, 1875.

From an Indiana Girl.

DEAR UNCLE AND COUSINS:—I have been reading the letters the boys and girls write to that gem of a paper, the RURAL, and thought I would write also. I think YOUNG TOM is very conceited. Wonder where he got all his fine ideas. I hope the "*fair* sex" will not bother him, as he is decidedly opposed to their company. I like GIPSY JESSIE very much, and hope she won't fall off the rocks. When she sees this she will think her tongue is very short compared with mine, and as I don't want her to have a bad opinion of me I will close this letter.—ELLA, *Noble Co., Ind.*

The Puzzler.

HISTORICAL ENIGMA.—No. 1.

I AM composed of 106 letters:

My 5, 23, 20, 92, 6, 2, 19, 41, 38, 4 a Syracusan writer.
My 79, 32, 17, 10, 22, 26, 30, 11, 33, 49, 51, 57, 80, 56, 15, 25, 3, 85, 41 the longest Roman war.
My 87, 61, 106, 74, 98, 12, 51, 7, 14, 27, 47, 13, 68, 53, 84, 38, 99 a brother of Constantine the Great.
My 8, 3, 49, 80, 23, 91, 21, 9, 24, 45, 35, 66 the music teacher of Epaminondas.
My 59, 34, 54, 35, 42, 55, 78, 29, 39, 18, 27 a Grecian officer of the Trojan war.
My 16, 72, 70, 45, 23, 28, 37, 101, 93, 89 a Greek philosopher.
My 43, 7, 60, 8, 42, 27, 62, 49, 96 a king of Bactria.
My 103, 104, 71, 86, 69, 27 a king of Thrace.
My 36, 58, 94, 65 a son of Severus.
My 97, 20, 85, 35, 12, 46, 25, 67, 94, 26, 88, 89, 102, 75, 41, 32, 33, 60, 100, 14 a son of Vespasian.
My 64, 63, 77, 91, 101, 61, 66 an Alexandrian grammarian.
My 31, 95, 106, 3, 20, 50, 11, 83, 26, 25, 56, 81, 73, 1, 75, 76, 51, 44 a noted divine.
My 52, 40, 82, 19, 8, 22, 63, 7, 22, 91, 105 a festival in memorium of those who perished in the flood of Deucalion.

My whole is a proverb of Scott Downey.

☞ Answer in two weeks. LITTLE ONE.

PUZZLER ANSWERS.—Jan. 22.

PUBLISHER'S SPECIAL NOTICES.

The Rural is a very good present to send to a friend, and it pleasantly reminds the recipient of the donor fifty-two times a year—this year fifth-three times. Any *subscriber* can send it to a relative or friend, as a present, at our lowest club rate—only $2.15, including postage.

Holiday Presents will be plenty this year among our Agent-Friends and others who form clubs for RURAL. Our list comprises many articles appropriate for presents. Induce a few of your friends to take the RURAL, and thus secure a Premium.

Officers of Agricultural Societies and Clubs, Granges, &c., can, if they will, materially aid in augmenting the circulation of the RURAL. Scores of such are already forming clubs; how many others will kindly do likewise?

Renew early if you would secure the uninterrupted continuance of the RURAL to your address; and pray don't forget to ask friends to join you in sending for the Fifty-three Numbers which we shall publish during 1876.

Back Numbers of this Year (from Jan. 1) can be furnished to all new subscribers, but we shall not send them hereafter unless specially requested. Those who desire can begin with any number, however.

The Best Paper, and the Best Premiums to Agents, is our motto. We ignore Chromos and all other cheap colored pictures, preferring to put our money *in the paper*, and in Premiums to Agents.

Select Your Premiums.—All persons entitled to Premiums will please designate what they prefer and notify us how and where to forward—whether by Freight or Express—if articles are not mailable.

Act as Agent!—Reader, if there is no agent for the RURAL in your locality please become one by forming a club. *It will pay.*

At Our Risk.—You can remit by Draft, P. O. Money Order or Registered Letter *at our risk.*

News of the Week.

HOME NEWS PARAGRAPHS.

PLANS for the enlargement of the Albany, N. Y., penitentiary have been completed. The addition will be 150x50, running westward. It will contain four tiers of cells, 184 in number. The cells will be seven feet long, four wide and seven high. The walls will be two feet thick, and the whole structure of the strongest character.

The lumber receipts at Albany, N. Y., by canal, for the year were 269,915,000 feet sawed lumber. There was on hand, as estimated, at the commencement of the season, 84,579,500 feet, and the estimated quantity now on hand is 83,000,000 feet. These figures show the amount of sales for the year to be 271,524,000 feet. To this must be added the lumber received by rail, which is supposed to be from 25,000,000 to 30,000,000 feet.

The United States Treasurer complains that large quantities of greenbacks and fractional currency are sent to his office for exchange which are perfectly fit for circulation, and that others are not put up in compliance with previously published regulations. In such cases he insists on his right to deduct expenses from the return remittance.

The Delaware and Hudson Canal Company have ordered that all their locomotives be kept ready for a heavy coal trade after Feb. 1. New locomotives are being constantly put on the road.

The Hudson River Railroad Company is drawing stone for the foundation of its depot at Fishkill Landing. It is to be built of brick and located a short distance north of the old depot.

The annual report of the Superintending Builder of the Elmira Reformatory shows that the total amount expended on the building last year was $285,601.27. There will be due when the work in progress is completed $58,053.70. There will be required to complete the building of the north wing, to equip the workshops in both wings, for furniture, etc., $300,000.

There is a man in the Ontario County poorhouse named Antdess Fletcher, who reached the great age of 113 years Oct. 12, 1875. He has been married twice, and says he has fathered 25 children. Preparations are making to take him to the Centennial.

Mr. Defreest has assumed the management of the local department of the Troy Times, and Mr. Sletcher takes the place of Mr. Johnson in the news department.

Sitting Bull, the Sioux Indian, who is now on the war path, is not the Sitting Bull whom the President some time ago presented with a rifle, but is another Indian of the same nation adhering to that name.

E. D. Winslow of Boston, Mass., has run away after committing forgeries to the amount, it is believed, of $600,000. He was formerly a clergyman, later a member of the Massachusetts State Senate, and two years ago purchased a controlling interest in the Boston Post and Boston Daily News. Winslow occupied the pulpit and preached an effective sermon less than two weeks before his flight. He attempted first to sail from this city to Brazil, but as the steamer was not ready to start he took passage for Rotterdam, Holland. As this country has no extradition treaty with Holland Winslow is safe from his pursuers.

A brilliant reception was given by the Washington Light Infantry, Charleston, S. C., on the evening of Jan. 26th, in honor of the Boston visitors who brought souvenirs of the participation of that corps in the Bunker Hill Centennial last June. The Hon. C. H. Simonton presided and welcomed the visitors. The Hon. J. C. Park of Boston, in behalf of the ladies of Massachusetts, presented to the corps a costly and beautiful banner, emblazoned with the arms of Massachusetts and South Carolina, the staff being surmounted with a white dove bearing an olive branch. In his address he referred to the Lexington celebration of April last, when he met Gov. Chamberlain and told him that though he had lost a dear son on the battle fields of Virginia, he would bury forever upon the hallowed ground where they stood the bitter memories of the past. [Applause.] Speeches were also delivered by Col. Simons, Major Gilchrist, Capt. Bartlett of Boston and others. The Bostonians have been the recipients of constant attention during their stay.

The Whitehall, N. Y., incendiaries have systemized their business. They now drop envelopes about the street containing letters addressed to the business men of the place, threatening that unless the writers are provided with work or bread another fire may be expected.

There are 21,255 Baptist churches in the United States, with 13,117 ministers, and a total membership of 1,815,000.

The California School of Mechanical Arts was incorporated Jan. 12, according to the provisions in James Lick's deed.

There are 3,000 white men in Florida who have not voted since the downfall of the Confederacy—enough to insure a Democratic triumph at every election.

Notwithstanding the mild winter a Worcester, Mass., skate manufacturer has sold 40,000 pairs of skates this season and is now busy filling an English order.

A company is about starting a great farming enterprise in the foothills between Marysville and Smartsville, Cal., where they have in a body 1,700 acres of land. Orchards of orange trees, English walnuts, almonds, and pecans will be laid out, and much ground devoted to clover, alfalfa, and sheep raising.

The population of Michigan is shown by the new census to be 1,334,031. In the year 1800 the population was 551. The male population is more than 60,000 in excess of the female, and the disproportion is constantly increasing.

The temperance movement is making great progress in New England. A grand demonstration took place in Gloucester, Mass., Jan. 27, under the auspices of the Reformed Men's Clubs. All the temperance societies joined in a grand procession and public services were held at the City Hall. About 1,500 men were in line. Many similar demonstrations by the temperance organizations throughout New England have already taken place, and many more are to follow. At Marblehead, on the evening of Jan. 26, over 200 signed the temperance pledge. A club in Gloucester which had but 16 members on its roll on the 6th of December now has 1,300.

Roxana Mead Drew, wife of Daniel Drew, the millionaire, died Jan. 27, at her residence in N. Y. City, at the age of 77, of paralysis of the heart. The deceased lady was born in South East, Putnam Co., N. Y., and was married to Daniel Drew in 1820.

Great thefts form a marked feature of the news of the past week. New England contributes the heaviest—the Winslow forgeries and the Northampton Bank robbery, the latter now being estimated at $670,000 worth of securities. But New Jersey comes well into line with a defalcation of about $140,000 at New Brunswick; from more distant States there are stories of nearly successful attempts in robbing express trains of very large amounts, and a long series of thefts from an express company in N. Y. City is just revealed.

The Hon. A. H. Stephens writes to a Washington friend that he has abandoned all hope of being able to take his seat in the House of Representatives during the winter, and that he has no intention of resigning.

The President has appointed the following Board of Visitors to West Point for 1876; Abner N. Ogden of Alexandria, La.; Gen. R. P. Hammond of California, Gen. Charles Devens of Worcester, Mass.; Matthew H. Bucham of Vermont; Prof. John M. Sterling of Wisconsin and Prof. H. C. Cameron of New Jersey.

By the burning of Fairbanks' scale shops at St. Johnsbury, Vt., on the night of the 22d inst., a loss of $40,000 was caused; fully insured. The fire originated from the throwing of a lighted match into a pot of paint.

Herr Hellwag, Chief Engineer of the St. Gothard tunnel, has decided that all the accessory lines and tunnels (of nearly four miles) leading up to the main trunk are to be commenced next summer, so as to be completed by 1880.

A Massachusetts co-operative enterprise has for an aim the occupation of Spartanburg, S. C., by thrifty folks from the overcrowed manufacturing towns of New England. The plan provides for cotton and lumber mills, and recruits are numerous.

Minnesota proposes to redeem herself from the stigma of repudiation by taking action looking to the payments of her old railroad bond indebtedness.

The Prudential Committee of the village district of Ludlow, Vt., have taken from the mills and shops children of school age and put them into the public schools.

Of 42,000 passengers carried over the Massachusetts railroads last year, not one was killed except by their own carelessness, and only six were injured.

A special dispatch to the Galveston News from San Antonio, Jan. 26, to-night says:—Advices received at different points on the Rio Grande, through couriers from Saltillo, state that a revolution has been started in the northern and central portions of Mexico, near the Rio Grande. Gen. Herrera has pronounced for the revolution and surprised the authorities at Parras. The revolutionists assaulted Rasoves, which is defended by Medno, who is prepared to defend it until reenforcements can arrive. The majority of the people in the northern districts are reported to be in favor of suppressing the rebellion, and are preparing for an emergency. Gen. Porfirio Diaz is at Laredo.

The robbery of $100,000 from a Chicago eastward-bound express car was neatly prevented near Toledo and the four robbers arrested.

The New Jersey Temperance Alliance held an enthusiastic meeting last week and raised $1,000 for a State Agent.

A discharged clerk of the Adams Express Company, having in some way secured duplicate keys, attempted to rob their office in this city, but was detected and fled.

U. S. Senator West of Louisiana is charged with securing his election by spending $25,000 in bribes.

Gen. Washington's family Bible will be exhibited in the Book Department at the Centennial Exhibition by Porter & Coates, Philadelphia. It is in three quarto volumes, each of which bears Washington's autograph on the title-page. The work was presented to Washington by the editor of this edition, Bishop Wilson, author of "Sacra Privata," was bequeathed by him to Lord Fairfax, and was left by the latter to the Herbert family, whence it came to the present owners.

About 11:30 o'clock, Jan. 22, while a Martella and Cincinnati freight train was passing over the iron bridge at Spring Grove avenue, in Cincinnati, Ohio, the structure gave way in consequence, it is said, of the weight of five cars overloaded with shelled corn. The falling cars carried the engine down with them, killing the engineer, named Conry; the fireman, Frank Lemman, and a brakeman. Two men who were driving on the avenue were caught in the wreck, and one of them suffers from a broken leg and the other from a broken shoulder. The bridge was a double track one. It is a total wreck.

The Lee Monument Association of Richmond, Va., has received $539.59 toward the fund for erecting a monument to the late Gen. Lee. The State Senate of Mississippi contributed $219.50 of this amount, and the public schools of Richmond the sum of $153.99.

The annual report of the State Treasurer of Massachusetts, which was presented to the Legislature last week, shows the total receipts for the year 1875 to be $18,454,960.13, and the total payments, $13,148,013.42, leaving a balance on hand Jan. 1, 1876, at $5,306,946.71.

The Hon. Henry H. Starkweather, M. C., from Conn., died on the 25th ult in Washington. He was conscious to the last, and conversed with his wife, who arrived two hours before his death.

A bill will be introduced to Congress to repay the $60,000,000 cotton tax to the South.

A heavy snow storm and intense cold prevailed west of the Mississippi last week.

Telegrams to our Ministers abroad from Secretary Fish indicate possible complications yet concerning Cuba.

The female shoe operatives in Lynn, Mass., have organized a protective association called "The Daughters of St. Crispin."

The Chicago Tribune announces that Eli Perkins, the celebrated American humorist, is about appear on the stage in an original play.

There has been no snow yet at Duluth since the winter set in.

A pansy bloomed in the yard of the Crawford House at White Mountain Notch last month.

The Maine editors and publishers in their Convention selected Philadelphia as the objective point of their summer excursion.

FOREIGN NOTES.

THE London Times, in its financial article, Jan. 26th, says that investment stocks remain very firm, particularly United States bonds, which are being bought heavily for export thither. The 1867s are steadily absorbed for New York, and the funded loan is steadily taken for investment in London.

Skating rinks appear to be all the rage in England, where there are several well patronized. Another is soon to be erected in London at a cost of £100,000. The owner of a rink at Brighton has refused £80,000 for it.

By the latest census Ireland has 5,412,397 inhabitants, divided, as to religion, as follows: Roman Catholics, 4,150,857; Protestants, 1,261,510. Of the Protestants 667,998 are reported as Episcopalians and 497,848 as Presbyterians.

The German government is preparing documents acknowledging the magnanimity of England in the manner of conducting the inquiry into the Deutschland disaster.

In the Reichstag at Berlin, Jan. 27, the amendments to the Penal Code were considered. The clause imposing penalties on members of secret societies and the clause directed against acts inciting hostility between different classes and attacking national institutions were rejected. Count von Eulenburg, Minister of the Interior, declared that the aim of the Social Democrats was to establish the "Red Republic," with communism and atheism. The new penal provisions were required to obviate the necessity of some day drawing the sword.

Cardinal Simeoni, the Nuncio at Madrid, has made a report on the Spanish elections, in which he says the Government of King Alfonso has been compelled to accept the alliance of the defenders of the so-called religious liberty, in order to secure political victory.

The Vienna *Wiener Presse* reports that during an insurgent attack on a Turkish camp near Neum, Jan. 26, three Turkish men-of-war, anchored off Klek, unexpectedly opened a violent cannonade on the Herzegovinians. As the vessels were in Austrian waters at the time their action caused considerable surprise. The result of the attack on the camp is not known.

War is imminent between Guatemala and Salvador. Both countries are arming.

In the Ontario Legislature, Jan. 27, the bill giving women the right to vote at municipal elections and on money by-laws was defeated by a small majority.

Four officers of the French army have been cashiered for attending a funeral service on the anniversary of the death of Napoleon III.

A special dispatch from Vienna to the London Standard, Jan. 28, reports that committees have been formed in seven Servian towns, including Belgrade, which openly agitate for the dethronement of Prince Milan.

The municipality of Moscow recently resolved to send a second contribution of $16,000 in aid of the sufferers from the Herzegovinian insurrection. The Czar has refused to permit the money to be sent, although he sanctioned the first contribution.

It is said that agents of the Russian Ambassador are urging the Bosnians to join the insurrection.

A Bonapartist Association, styled the Conservative National Committe, has issued a manifesto announcing that they will support President MacMahon until the expiration of his term in 1880. They will then demand that an appeal to the people be made for determining the future form of government for France.

Gambetta and other Republicans, apprehensive of a bad effect in the provinces if the Radicals should succeed in electing all the Senators for Paris, are strenuously working to bring about a compromise between the various Republican factions.

The palace expenditure of the Sultan of Turkey has been $2,000,000 a year ever since his succession.

An iron steamer of small dimensions is to be built at Dubuque for the King of Siam, and shipped in sections.

A Berlin dispatch to the London Post says that it is expected that Queen Victoria will visit the Imperial Court while she is in Germany.

Lieut.-Gen. Henry William Stisted, C. B., is dead. He was the first Lieutenant-Governor of Ontario under the Dominion.

Writs were served on Minister Schenck and others connected with the Emma Minting Company in London, last week.

Cienfuegos is said to have been pillaged by Cuban insurgents.

At Caratamendi Jan. 26, the Royalists captured sixty Carlists, one cannon and one mortar. Gen. Loma continues his advance into the interior of Biscay. A battle is imminent in the Urola Valley.

Croquet is rapidly giving way to roller skating in London, and the ladies' newspapers are publishing concise rules to promote gracefulness of movement and proficiency in the sport.

THE SEASON, CROPS, PRICES, ETC.

Harlem Springs, Carroll Co., Ohio, Jan. 20.—Weather warm and wet. No snow, and but few cold days this winter. Corn was a good crop as regards quantity, but the quality is poor on account of the early frosts, a great deal spoiling in the cribs. Winter wheat looks well. Stock of all kinds doing average well. Sheep are worth from $4 to 5 ₮ head. Cattle from 3½ to 4c. ₮ lb., and scarce at that. Horses bring from $75 to $150 ₮ head, and dull sales at that. The apple crop was a total failure. Peaches ditto. Potatoes and other vegetables good. Times dull, as a matter of course, but, as our county is strictly devoted to agriculture, we experience no serious inconvenience from the depressed state of trade. The Ohio and Toledo Narrow Gauge R. R. passes through our County. The N. G. is a decided success. J. B. LEE.

Point of Timber, Contra Costa Co., Cal., Jan. 17.—It is raining hard now—the best rain in four years, or, in other words, the heaviest rain we have had in that time. The ground is too wet to plow and will be for some days to come. The wheat crop never looked better than it does at this time, and the farmers are mostly done seeding. Some have been plowing for summer fallow. Some wheat is now four to five inches high, and some is not yet up. The writer has 60 acres yet to sow, and half of the ground is yet to be plowed. We have had the epizootic among our horses here this winter. I mention this for fear you will grumble because I am so far behind with my work.—JOHN R. BYER.

IODO-MAGNESIAN SPRINGS.

MR. EDITOR:—For the sake of humanity I feel called upon to tell your readers what I know about the curative power of the Iodo-Magnesian Springs of Beloit, Wis. For ten years previous to last spring I have been troubled with what physicians term "the prostate," causing great irritation and severe pain, with burning sensation. For months at a time I have been disturbed in my sleep from seven to fifteen times each night. The 1st of March last I commenced using two glasses daily of the Iodo-Magnesian Spring water. It afforded me immediate relief, and for two months past I have been comparatively free from pain, and have slept from seven to eight hours each night without disturbance. I have recently visited these Springs and found there a large number of persons who had been cured of various diseases by these waters.

Persons desiring further information can address me, personally or by letter, at 56 and 58 Park place, New York. Yours truly,

B. E. HALE.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Jan. 29, 1875.

RECEIPTS.—The receipts of Produce for the week were as follows:

Oil Cake, pkgs	12,586	Pork, bbls	412
Flour, bbls	83,769	Cut meats, pkgs	7,500
Whisky	2,552	Lard, pkgs	15,183
Corn meal, bbls	1,049	Tar, bbls	—
Corn meal, bags	4,052	Tobacco, hhds	1,065
Wheat, bush	191,178	do. cases	3,827
Corn, bush	350,712	Butter, pkgs	26,011
Oats, bush	161,152	Cheese, bxs	16,161
Rye, bush	551	Cotton, bales	21,515
Malt, bush	2,873	Rosin	10,708
Barley, bush	213,800	Spts. turp., bbls	1,759
Beans, bbls	1,172	Dried Fruits, pkgs	191
Grass seed, bags	3,119	Eggs, bbls	28,572
Ashes, pkgs	96	Crude Turpentine	8,693
Beef, pkgs	1,741	N. O. Molasses, bbls	1,500
Peas, bush	100,915	Peanuts, bags	2,022
Beeswax, pkgs	10	Dressed Hogs	3,787
Wool, bales	509	Oil Cake, pkgs	4,000
Hops, bales	2,529		

BEANS AND PEAS.—The export trade in marrow beans is good, but prices are not better as the liberal receipts prevent an advance. Mediums are dull, that is they lack the steady wholesale outlet that ought to attend the winter months. However, the bean trade is not the only one that has had a disappointing season this year. Pea Beans are quiet, and must be had clean and handsome to bring the extreme. Both red and white Kidneys are still quoted low. Limas do not go into use to the extent that their quality as a food item should give them. Canadian peas have sold heavily this season for feeding abroad; just now there is some lull in the call and prices are only steady. Green peas are quiet the inside rate mainly representing sales. S. B. C. peas nominal.

We quote Beans, pea, new, prime, $1.50@1.60; other, 1.25@1.35; medium, new, $1.40@1.45 fair to good, $1.15@1.31; very poor, 50@1.10; marrow, new, prime, $1.70@1.75; other, $1.41@1.60 white kidney, prime, $1.85@1.95; fair to good, $1.60@1.70 red kidney, new, prime, $1.51@1.60; fair to good, $1.31@1.45; California Lima, choice, $3.50@4.00. Peas, Canadian, bbls., new, duty paid, $1.25@1.27; bulk, in bond, $1.02@1.04; green, new, ¾ bush., $1.50@1.60; Southern B. E., ¾ 2 bush. bag, $3.10@3.15.

Exports of beans since Jan. 1st, 8,484 bbls.; of peas, 51,405 bush.

BEESWAX.—Has a slow export demand, with very little doing from other sources. Sales at 31½@33c. for Western and Southern.

BROOM CORN.—The largest New York sale of the season was made this week, 12 car loads Western common at 5@7c. Sellers dispair of receiving any prime corn this season.

We quote Brush, short green, 9½@10c.; hurl, green, 10@; green, medium, 6@7c.; red and red tipped, 4@5c.

BUTTER.—The market continues without special new features. Quotations have a sound of improvement, owing to the fact that State butter has largely taken the place of Western for medium use this season, and as the cheap parcels have been well picked up, the standard of the general stock is better. Fancy State butter is scarce here, if indeed much of it remains to come forward. Interior holders continue to place a restrictive value upon some of their fine dairies, wanting about all that can be realized here for lots as they run. Herein is one of the troublesome features of the butter trade. A line of stock that may have a splendid local reputation at home often falls off a grade when brought into competition with consentratal receipts. Then again few marks of stock can be relied upon to run choice from a tub to tub or firkin to firkin, and this fact alone prevents buyers from paying a full straight price, even though he requires extras to fill his best wants. Its points are manifestly—would be light if the weather were at all seasonable; and we do not learn of any one being heavily stocked up with State. A late spring will give more consumptive margin for the unsold portion of the crop, and the dependence upon such an advent perhaps renders farmers less anxious to part with lines. Still it must be remembered that the chief opponent to advanced or even high prices has the scarcity of money in family circles and a slow spring does not do much towards enlarging the general purse. Western solid packed butter is getting a better share of the demand owing to the lack of low-priced good State. Rolls remain a drug; buyers became dissatisfied with the style and quality several weeks ago, and few marks have required their sale. Small packages of cloth wrapped sell best.

State dairies entire, extra, 31@31c.; entire, good to prime, 28@30c.; fair to good, 24@28c.; firkins, selected fresh, 31@33c.; good to prime, 25@28c.; fair to good, 21@24c.; half-firkin tubs, selected, 31@32c.; good to prime, 31@33c.; fair to good, 27@29c.; poor to fair, 25@27c.; State, Welsh, tubs, fall made, 30@31c.; dairies, 27@29c.; good to prime, 25@27c.; fair to good, 21@25c.; poor to fair, 22@23c.; Pennsylvania, store packed, 17@25c; Western, dairy tubs, selected, 25@27c.; good to prime, 24@26c., tubs selected fresh, 26@27c.; good to prime, fresh, 23@25c; fair to good, fresh, 21@23c.; poor to fair, fresh, 20@21c.; Western, early packed, selected, 21@22c.; Western, early packed, other, 15@20c. Roll butter, good to prime, 19@20c.; fair to good, 17@18c.

CHEESE.—There has been increased trade this week from all sources, and a generally strong market. The Eastern markets are short of low grades, and are dealing in them here almost exclusively; sales from 11c. down to 6c. English shippers are taking fine and strictly fancy at 14@14½c.

New State factory, fancy, 13¾@13¾c.; fine, 12½c.; do. good to prime, 11¾@12¼c.; fair to good, 10@11¼c.; poor to fair, 7@11c. State Farm Dairy—fancy, 12@12¾c.; good to prime, 10¾@11½c.; fair to good, 9¾@10¾c. Western factory, cheddar, fine, 12@12½c.; good to prime, 11@12c.; flat fine, 12¼@13c; good to prime, 11@12c.; fair, 8@10c.; poor to fair, 6@8c; pineapple, 16@19c. English dairy, Connecticut, 12@13½c., do. State, 15@18c.

COTTON.—There has been a short upward movement, but at the close prices have reacted a trifle. Latest sales for January, 13¾c; February, 13 5-32c.; March, 13 11-32@13¾c.; April, 13 9-16@13 9-32c.; May, 13 25-32c; June, 13 31-32@14c.; July, 14¼@14 5-32c.; August, 14 3-16@14¼c.

Quotations for spot cotton, based on American standard of classification:

	Uplands.	*Ala.*	*Orleans.*	*Texas*
Ordinary	9¾	9¾	10¼	9¾
Strict ordinary	10¼	10¼	10¾	10¾

Strict ordinary	11	Middling	12¾

DOMESTIC DRIED FRUITS.—Apples are about ¼c. higher under an increased jobbing demand. Peaches are dull and altogether nominal. Blackberries scarce and strong. Splendid samples of California raisins are in market.

Apples—State, sliced, 10¼@10½c.; quarters, 9½@—c.; Western quarters, 9c.; Southern sliced, 1875 crop, 10½c. for prime, and fancy 12c; Tennessee qrs., 8¼@8½c. Blackberries, new, 12½@13c. Peeled peaches, good and prime Georgia, 14@16c.; do. fancy, 18c. Unpeeled peaches, new, 12½c. for halves, 11@11½c. for quarters. Plums, 20c. Raspberries, 27c. Cherries, 22@23c.

EGGS.—One of our exchanges remarks that "this is an unusual part of the year for cheap eggs," which is so. Last year at this date, Western were quoted at 29@30c. To-day they are down to 22@23c., the latter an exceptional price. If retailers would only follow a decline quicker in the release of their stock, we might get rid of the pressing surplus; but they as well as receivers, expect to see a price-reviving snow storm, and the feeling in the trade is consequently unsettled. Limed are not selling owing to low fresh; but the stock is not heavy.

We quote near points, 24@—c.; State and Pennsylvania, —@23c.; Canadian, choice, 22@23c.; Western, do., 22@23c.; other Western, 20@22c.; Southern, 20c.; Limed, 18@20c.

FLOUR.—There have been large drafts on the supplies on export account, and with small arrivals prices are strong.

Superfine State, $4.30@4.75; extra do., $5.00@5.90; superfine Western, $4.20@4.75, extra do., $5.00@5.90; No. 2, $3.25@4.10 extra round-hoop Ohio, $5.00@5.30 trade brands do., $5.35@7.40; white wheat extras, $5.95@7.00; St. Louis, $5.20@9.00; City Mills extra, $5.10@6.60; Southern at $4.25@4.75 for superfine; $4.80@8.30 for poor to choice shipping extras; $6.40@8.75 for trade and family brands. Rye flour at $4.10@5.30. Corn meal—There is a fair sale at $2.85@3.40 for yellow Western, $3.85@3.35 for white do., $3@3.35 for Jersey and Pennsylvania, and $3.00@3.05 for Brandywine.

FRESH FRUITS.—Exports of apples since Jan. 1st, 1,325 bbls.; same time last year, 4,195 do. Large red and choice Greening apples stand where they did in prices, but as before the tender sorts of any variety that have gone well through the "heat" are offered at wide ranges. The stock receives some addition by rail, but buyers are suspicious of them, and stored lots sell the most readily. Florida oranges are running poor. The stock of cranberries is reduced to N. J growth, and prices are lighter. Peanuts in fair demand and higher.

Apples.—Spitzenbergs and Baldwins, fine, $3.50@4; Greenings, $3@3.50; mixed, good, $2.50@2.75; do. fair, $2@2.25. Pears—Choice Cal., ¾ box, $4@4.50. Cranberries—Jersey, choice, bush. crates, full measure, $3.50@3.75; good to prime, $2.25@3.50; made bbls., $11@12. Nuts—Peanuts, Virginia, $1.50@1.80; do. Wilmington, $1.80@2.05; do. Tennessee, 75@90c.; Hickory nuts, $1@1.25. B. walnuts, 50c.

FURS AND SKINS.—At the Leipsig sale prices were very little different from the late London sale; home rates unchanged. We quote prime skins:

Bear, Northern, as to size and quality	$10 00	to	15 00
Bear, Southern and Northern yearlings	5 00	to	10 00
Beaver, Northern, per skin	2 50	to	3 50
Beaver, Western and Southern	1 50	to	2 50
Badger	20	to	50
Cat, Wild, North and East States, cased	50	to	60
Cat, Wild, Southern and Western	40	to	50
Fisher, Northern and Eastern	7 00	to	12 00
Fisher, Southern and Western	3 00	to	8 00
Fox, silver	15 00	to	50 00
Fox, Cross, Northern and Eastern, according to size and color	3 00	to	5 00
Fox, Red, Northern and Eastern, according to size and color	1 50	to	1 65
Fox, Red, S. Penn., N. J., and N. Ohio	1 25	to	1 50
Fox, Red, Southern and Western	75	to	1 00
Fox, Gray, North and Eastern, cased	75	to	1 00
Fox, Gray, South and West	40	to	60

Rabbits, prime, cased	2 00	to	3 00
Skunks, prime black, No. 1, cased	—	to	1 50
Skunks, prime black, No. 1, open	—	to	1 00
Skunks, prime one-half white streak	50	to	80
Skunks, white streaked	15	to	20
Wolf Skins, mountain, large	2 00	to	3 00
Wolf Skins, prairie, prime	75	to	1 25

GRAIN.—For wheat there has been a very slow export demand, and prices have ruled weak. Latest sales at $1.06@1.10 for No. 3 Milwaukee spring mixed; 98c.@$1 for rejected spring; $1.05 for rejected and mixed spring in lots; $1.47 for choice amber Pennsylvania; $1.20@1.47 for winter red and amber; $1.35@1.55 for white, and $1.33@1.40 for No. 1 springs. Rye quoted 82@92c. for State, and 86@88c. for Western. Barley is unsettled and dull; Canada quoted at $1.20@1.45; four-rowed State at $1.12@1.35. Corn closed firm, with a fair export inquiry. Sales at 62¾@63c. for mixed Western; 62½@63½c. for yellow Western; 63c. for white do. Oats have a more active inquiry, with prices higher. Sales at 48@50c. for white Western; 53c. for white State; 48@48½c. for mixed Western.

HAY AND STRAW.—Receipts are lighter, demand more active, and prices more in favor of the seller for retail grades. Shipping hay dull.

Bale hay is quoted:—Shipping, 85c.; retail qualities, $1.05@1.15; clover, 70@80c.; salt, 65@70c. Straw is quoted at $1.10@1.20 for long rye; 80@90c. for short rye; 75@85c. for oat. Exports since Jan. 1st, 1,136 bales; same time last year, 3,307.

HIGHWINES.—Have a slow sale, with prices weak, quoted at $1.11.

HONEY unchange. We quote clover comb at 18@22c. for buckwheat and strained, 10@12c.

HOPS.—Exporters have been operating moderately with a light local trade, and prices well sustained.

New York State, 10@15c.; Eastern, 10@15c.; Wisconsins, 10@15c.; Yearlings, 8@10c.; Olds, all growths, 4@6c.; Californians, 17@20c.

MILK.—With a light supply in winter, too, prices have ruled as low as 1.25@2.25 per can of 40 quarts at the platforms.

POULTRY AND GAME.—Dressed poultry has almost lost a season. This is the part of the year when sellers expect general stock to make some money; but, with moderate supplies, prices are low.

Turkeys, N. J., choice, 15@16c.; do. other, 13@14c.; State and Western, choice, 15@16c.; do. other, 12@13c. Chickens, N. J., 13@16c. State, as to quality, 13@16c.; Western, 12@14c. Ducks, N. J., good to prime, 16@19c.; State, do., 15@18c.; Western, do., 15@16c. Geese, N. J., prime, 12@14c.; State, good to prime, 10@13c.; Western, do., 9@11c.; do.

Fowls, Jersey, 15@16c., Western, 14@15c. Chickens, 10@11c. Roosters, 6@8c. Turkeys, Jersey, 15@16c.; Western, 15@16c. Ducks, Jersey, ¾ pair, 87c.@$1.25; Western, 50@70c.; Jersey, $2@2.50; Western, $1.25@1.62.

Game birds are scarce and rule very high, though they sell readily at the figures. The absence of snow at the West has saved a great deal of game this season. This is the last week for venison.

Quail, trapped, prime, ¾ doz., $4.00@1.50; soft, $2.00@3.00. Grouse, prime, ¾ pair, $1.10@1.25; drawn, 75@85c. Partridges, choice, ¾ pair, $1.00@1.10; other, 50@75c. Hares, ¾ pair, 30@35c. Rabbits, ¾ pair, 35@40c. Venison, short saddles, ¾ lb., 11@14c. Ducks, canvas back, ¾ pair, $3@3; redhead, $1@1.50; common, 50@75c.

PROVISIONS.—For pork and lard prices have been reduced on account of the larger supplies of hogs at the West, but bacon has been in good export demand and strong. Quotations are for mess pork, $20.75@21.80 for spot lots, $20.80 for January and February, and $20.85@20.90 for March deliveries. Extra prime, $16; prime mess, $20. Dressed hogs at 8¾@9¾c. Bacon at 11c., for Western long clear, 11¾c. for short clear, 11¾c. for long and short clear, together. Lard at 12¾c. for spot, January and February deliveries, 12¾c. for March and 12¾c. for April. Stearine at 12½c. for Western. Beef hams, $24@25 for Western, and $22@22.50 for Southern. Beef, new extra mess, $12@12.50; do., plain mess $11@11.50; new tierced at $23 for prime mess. $25 for India mess. City extra India mess, $30.50@32. Old extra mess, $11.50, and $10.50 for plain mess; packet, $15.50@16.50.

SEED.—Clover is in good export demand and favoring the seller; State quoted 11¾@14¾ for prime to choice; Western at 14¼c.

TOBACCO.—Exporters are purchasing more freely Kentucky leaf and Seedleaf, with a confident range of prices.

ROCHESTER, Jan. 27.—Flour market steady spring, $6.75; amber winter, $7.00; white winter, $7.25; double extra, $7.50. Rye flour quiet at $5.50. Wheat is dull; Milwaukee club, $1.25@1.30; amber winter, $1.15@1.20; white winter, $1.20@1.30. Oats, nominal at 35@36c. Corn steady at 70@75c. Corn meal, $1.50@1.75. Butter, 24@27c. Cheese, 12@14c. Eggs, 25@27c. Lard, 13½@14c. Apples, ¾ bu., 50c.@$1. Potatoes, bu., 30@35c. Beans, ¾ bu., $1.00@1.40. Mess pork, $21@—. Wool, 30@35c. Hay, $10@11. Straw, $7@12. Timothy seed, $2.75@—; clover, $5.75@6.00. Wood, hard, ¾ cord, $8@9. Coal, $6.95@7.35 for stove.

COUNTRY CHEESE MARKET.

LITTLE FALLS, N. Y., Jan. 20.

THERE is an increased firmness in the market this week, though prices have not materially changed. The general impression is that the lowest rates have been reached, and that the market must now steadily advance. The stock of cheese back in the country is not large and is very much less than has been reported. There is a brisk demand in England, and we think, with an improved demand both at home and abroad, the market will be cleared so that the spring crop will have a fair movement with fair prices.

Farm dairies now coming forward are poor, being the ends of the season's make and badly skimmed: these go at 6@8c. The late ends of factories bring 10@11c., while Septembers and Octobers will command from 12½@13c. But these last are not on the market, as holders want 13@14c for all goods that are fine.

Winter butter sells at 22@25c., according to quality.

Our advices from abroad say that the market is fairly cleared of old stocks and low qualities. Quotations are:

American extra, 64@68s.; fine, 62@64s.; common, 56@60s. English cheddar brings 84@94s.; Scotch, 70@76s. Dutch cheese—Edams, 74s. ¾ cwt.

There is more doing in American and Canadian butter, which sells at 90@120s. ¾ cwt. Clonmels sell for 150s.; Dorsets, 102s.; Swedish, 160s.; Normandy fine, which is very scarce, 160s. ¾ cwt.

LIVE STOCK MARKETS.

NEW YORK, Jan. 22, 1876.

RECEIPTS OF LIVE STOCK.

	Beeves.	Cows.	Calves.	Sheep & Lambs.	Hogs.
Sixtieth St.	3,070	41	312	7,40	000

Totals this week	9,119	63	368	20,717	23,778
" last week	6,746	81	631	30,381	29,971

BEEVES.—There was a moderate condition of trade on last Monday, the herds fresh to hand being nearly all sold off by noon; quality ranged from coarse to choice, and prices from 8@13¾c. ¾ lb.; weights, 4¼@0 cwt. Wednesday, trade slow, and, with several car loads unsold Western, the markets closed at noon; prices, 8½@12¾c. ¾ lb.; 5½@7¾ cwt. Thursday, trade slow at 7¾@13¾c. @ lb.; 4¾@9 cwt. Friday, markets closed dull at 8@12¾c. ¾ lb., 6@11 cwt. From 53@58 lbs., net, were allowed to the cwt. Spanish herds sold at 8¾c. ¾ lb. Native steers at 8@12¾c.; grade do., 12¾@13¾c. Oxen, 9@13c. Dry cows, 5@6c., gross weight. Bulls, 4@5¾c., gross weight. Mixed herds, 8¾@13c. Yearlings, $18@23 ¾ head.

COMPARATIVE RATES.

Quality.	This week. Cents.	Last week. Cents.
Good	12 @13¾	12 @13¾
Fair	11 @11¾	11 @11¾
Poor	10 @10¾	10 @10¾
Poorest	7¾@ 9¾	8 @ 9¾
Gen. selling rates	10 @11¾	10¾@11¾

MILCH COWS.—Trade fair in fair quality cows; no demand for poor. Twenty cows sold at $50@70 ¾ head; 11 do. at $60@75.50 ¾ head; 5 do. at $40@55 ¾ head; 6 do. at $79@92.50 ¾ head; 1 do. at $115—calves always included.

SHEEP AND LAMBS.—Monday last trade in sheep very slow at 5¼@8c. ¾ lb.; lambs, 7¼@8c. Wednesday, no improvement in trade; sheep sold at 5@6¾c.; lambs not quoted. Thursday, sales dull at 4½@7¼c. ¾ lb.; lambs not on sale. Friday, the markets closed weak at 4¾@7c. ¾ lb. for sheep; lambs, 6¾@7¾c. ¾ lb. Virginia sheep sold at 6¾c. ¾ lb.; Illinois, 5¾@6¾c.; Indiana, 5¾@6¾c.; Michigan, 6¾@7¾c.; Pennsylvania, 6¾@7c.; State, 5¾@6¾c.; Ohio, 5¾@7¾c. Canada, 7@8c. State lambs, 7¾@8c.; Pennsylvania do., 6¾c.

HOGS.—Trade small in live hogs at 7¾@8c. ¾ lb.; city dressed slow or sale at 8¾@9¾c. ¾ lb., ordinary quality; selected quality, light weights, 10@11c. ¾ lb.; Western dressed slow at 8½@8¾c. ¾ lb.

HORSE MARKET.—City trade slow; 22 head, poor quality, light harness horses sold at $50@82 ¾ head; 31 ordinary quality, do., $100@@550 ¾ head. Railroad horses sold at $110@195 ¾ head. Stage horses at $200@275 ¾ head; 15 head of roadsters, with moderate trotting action, at $300@500 ¾ head; 1 pair stylish carriage horses, $1,300; 3 pairs heavy draft horses, $350@900 ¾ pair, fair quality, choice. Thirty-one horses arrived ¾ Erie Railroad, via. Oak Cliff Station.

Address MOORE'S RURAL NEW-YORKER
78 Duane St., New York

MOORE'S RURAL NEW-YORKER is an excellent Agricultural paper, and very popular. As a family visitant it is hard to beat in the attractions it holds forth for young and old. We are pleased to see that Mr. MOORE is full of his old enterprise and bent on making the paper better and better from year to year.—*Yates Co. Chronicle.*

MOORE'S RURAL NEW-YORKER is one of the readable, useful, family papers, equally in demand by the lady in her conservatory, the matron with her household, the farmer in his field, the stock raiser among his animals, and the young folks around the evening lamp.—*Lawns of Life.*

PERSONAL ITEMS.

FREEMONT is 63.

CARDINAL ANTONELLI is ill.

NILSSON'S husband, M. Rozeaud, is dangerously ill.

BESSIE TURNER'S novel has reached its fifth edition.

HENRI ROCHEFORT is writing a history of New Caledonia.

THE autobiography of President Finney will be published early next year.

BARON ROTHSCHILD was among the passengers sailing for Europe recently.

CARDINAL BONAPARTE has been appointed Camerlingo of the Sacred College.

MISS CHARLOTTE CUSHMAN authorizes a denial of reports that she is seriously ill.

SECRETARY FISH opposes the reduction of force and of salaries in the foreign service.

THE statue of John Winthrop, by Greenough, destined for Washington, has arrived at Boston.

A LIFE of Count Rumford and his complete works will soon be published in England.

MR. W. R. CALLENDER, member of the House of Commons for the city of Manchester, is dead.

MARK TWAIN'S last joke is a desire to be run as an independent candidate for Mayor of Hartford.

M. DE LA ROCHETTE, a Legitimist, who was elected Senator for life by the French Assembly, is dead.

THE Hon. Robert C. Winthrop has been selected as the Centennial orator for the Fourth of July in Boston.

GOV. PECK of Vermont has decided to call a special session of the Legislature to provide for the Centennial.

THE late Viscount Amberley, only son of Earl Russell, completed a theological work a short time before his death.

JUDGE BRIGGS decides that Dr. Helmbold's mind is not in a healthy condition, and that he had best remain in the asylum.

EX-GOV. F. THOMAS of Maryland, was killed by a train at Frankville, a station on the Baltimore and Ohio Railroad, Jan. 22.

MR. JAMES RUSSELL LOWELL'S course of lectures at Cornell University next Spring will be on "Early European Literature."

SENATOR ENGLISH has sent a check for $500 to the building committee of the new St. Michael's Episcopal Church at Naugatuck, Conn.

A. WILLIAMS, ex-Mayor of Oakland, Cal., but more recently a resident of New York, died in San Francisco, Jan. 20, at the age of 79.

SENATOR SHERMAN is in favor of Gov. Hayes for the Presidency, and advises Ohio to unite in his favor at the Cincinnati Convention.

URSON County, Ga., claims the champion centennialist. He is a negro named Charles Dubignon, is 125 years old, frisky and vigorous.

PROF. TOWLER has been appointed pro tempore President of Hobart College on account of the recent resignation of Dr. Van Rensselaer.

WITH more zeal than prudence, Miss Mary Meek of Bonaparte, Iowa, assisted in a raid on a liquor saloon, and is now being tried for burglary.

AMERIGO VESPUCCI, the last descendant of the navigator of that name, after whom America was named, died a few days ago near Florence, Italy.

THE Trinity Church in Boston, sets a high estimation on its rector, the Rev. Phillips Brooks, and is said to have insured his life to the amount of about $100,000.

THE statue of Samuel Adams which Massachusetts has ordered for the National Gallery as a companion statue of Winthrop is nearly finished and will reach Boston in April.

DR. LINDENFELD, who proposes to settle a large German colony in Los Angeles Co., Cal., has invited owners of extensive ranches to send him maps and prices of eligible sites.

MRS. and Miss MITCHELL, wife and daughter of the late Dominion Minister of Marine, are assisting in a Methodist revival at Montreal. Both ladies are fervent, fluent speakers.

CORNELIUS VANDERBILT, President of the New York Central, Harlem and Lake Shore Railroad companies, has been elected President of the Canada Southern Railroad Company.

ROBERT DALE OWEN writes that his late illness was due to overwork for a period of two years and a-half before the attack, but that he is now in excellent health, better than he has been for five years past.

AN English gentleman has offered $25,000 to the London Missionary Society as the nucleus of a fund for establishing a mission on Lake Tanganyika, with its headquarters at Ujiji, where Stanley met with Livingstone.

THE Rev. Dr. Behrends, pastor of the First Baptist Church in Cleveland, Ohio, has resigned his position and withdrawn from the Baptist denomination on account of a change in his views in regard to the question of communion.

EX-PRESIDENT MCLEAN of Princeton College and the Rev. Samuel Alexander of New York were appointed at a recent meeting of the trustees of the College to prepare an epitome of the history of that institution, to be placed in the Centennial Exhibition.

"GENERAL" COE, now living in Van Wert Co., Ohio, was born July 4, 1776. Both parents were massacred by Indians. He served through the war of 1812, and was with Gen. Scott at the capture of Niagara and Fort George. Mrs. Coe, aged 90, and several children ranging from 50 to 70 years of age, are taking care of the veteran.

78 Duane St., New York

MOORE'S RURAL NEW-YORKER is one of the best agricultural and family newspapers published, and for many years has been an established favorite. It has a most competent corps of writers, and while matters of agricultural interest receive especial attention, the literary and news departments are not neglected. The conducting editor and publisher, D. D. T. MOORE, assures his patrons that his paper for 1875 will present even greater attractions than before, and he is sure to fulfill his promise.—*Penn Yan Express.*

NEWS CONDENSER.

— Troy has two cases of small-pox.

— Nevada has a population of 50,540.

— Utah has one Gentile to five Mormons.

— Goodwin's Hotel at Amherst, N. Y., is burned.

— A Tilton Club has been organized at Auburn.

— Oregon has within its limits 2,752,000 acres of fertile soil.

— Fifty thousand Hebrews carry on business in the United States.

— An additional fine-art building will be put up at the Exposition.

— Illinois has a uniformed and equipped militia force of 3,256 men.

— The wholesale trade of Chicago for the year 1875 was $703,228,000.

— There are five counties in Georgia in which there is not a hired man.

— California's wool clip is expected to reach 50,000,000 pounds next season.

— The Auditor of Kentucky reports the population of the State to be 1,666,525.

— The Rensselaer Polytechnic Institute at Troy, in this State, has now 185 students.

— That was a rum fellow who got mad because Santa Cruz didn't bring him a present.

— Of the 38,000 persons employed in watch making in Switzerland one-third are women.

— The courts of Utah are closed because there is no money to pay witnesses and jurors.

— The canal deposits have been removed from ex-Auditor Thayer's and Jarvis Lord's banks.

— A widow has just died in Rome and left a quarter of a million dollars in cash to the Pope.

— Milwaukee, Wis., keeps 8,607 of the 9,762 children enrolled in attendance on the public schools.

— Probabilities point to New London as the place where the Yale-Harvard race will be rowed.

— If Alaska is annexed to Washington Territory, the latter will have an area of 640,000 square miles.

— The Vatican has decided that it will not resist the inspection of the seminaries by Government officials.

— On Jan. 23, seventy new members were received on probation at the Methodist Church, Lansingburg.

— New Brunswick proposes a canal from the Bay of Fundy to the Gulf of St. Lawrence, which is a good idea.

— During the year 1875 the employes and apparatus of the National Lifeboat Association of Great Britain saved 725 lives and 29 vessels.

— An attempt to repeal the compulsory education law in the State of California will be made during the present session of the Legislature.

— Reports to the Controller of the Currency show that the National banks in New York City on Dec. 17, 1875, had $366,237,512.12 of resources.

— The Grand Lodge of F. and A. M. of the State of Michigan, began its annual session at Grand Rapids, Jan. 25. The attendance was very large.

— The production of pig iron in the United States in 1875 was about 2,100,000 tons net, a falling off of 600,000 tons as compared with the previous year.

— Eight pin factories in the United States manufacture 47,000,000 of those useful instruments daily. It is yet to be discovered what becomes of them.

— A girl, one of a bridal party of tourists, was recently blown off the highest cliff of the Giant's Causeway in Ireland, and, of course, instantly killed.

— The City Council of New Orleans has adopted a series of resolutions inviting the Emperor of Brazil to make that city the point of his arrival in the United States.

— The Pearl River Navigation Company is accused of defrauding Mississipi out of 123,000 acres of land, and a suit to compel restitution has been commencee.

— At a leap year party in Wilmington, N. C., recently, Joseph Walters was elected "belle" of the evening, and duly crowned as the Queen of Love and Beauty.

— M. M. Wilson & Co. of Troy, have purchased the Ithaca, N. Y., Glass Works, and will put them in operation again as soon as possible. This is good news for Ithaca.

— The Vermont Legislature will not be convened in special session to make an appropriation for the Centennial, too much opposition to the scheme having been manifested.

— Of the one hundred and seventeen women now studying at the Michigan University, four have chosen law, forty-seven medicine, and fifty-six literature and science.

— Instead of issuing a ruinous amount of bonds to pay for the new Court House, the authorities of Hamilton County, Iowa, have given the contractors 1,360 acres of land in full settlement.

— Chinamen stand by each other in this country. Those employed at shoemaking in North Adams have contributed out of their scanty earnings $347 to defend one who is entangled in law in Nevada.

— Boxes in the new London Opera House have been sold for £10,000 each, the owner to receive five per cent. interest if the profits allow, and to have the use of it during Italian opera seasons only.

— The ladies of Digby, N. S., have succeeded, through voluntary subscriptions and concerts, in raising money enough to light all the principal corners of Digby. The lamps are up and give a good light.

Sewing Machines.

"GENERAL FAVORITE"

No. 2,

Recently perfected and offered to the trade by the

WEED SEWING MACHINE COMPANY,

Possess many advantages, both in construction and capacity, over machines now in use by

MANUFACTURERS.

The Machines made by this Company have always been noted for simplicity, a merit which has been preserved in this new style and combined with great strength, especial care having been taken to provide against the wear and tear of use in Factories running by

STEAM POWER.

Actual WORK is the only test of a sewing machine. The Weed Co., desirous of thorough investigation, are prepared to place these machines on trial, feeling confident that practical work will convince intending purchasers of their merit. Manufacturers will please examine if our claims are not correctly made on the following points:

CONVENIENCE.

The large space under the arm. From needle to foot of arm, 9 inches; from needle to bend of arm, 11 inches; from bed to bottom of arm, 5 inches. Easily oiled, threaded and cleaned.

SIMPLICITY.

No cams or cogs are used, a continuous circular motion, preventing vibration, and rendering a high rate of speed possible, while noise is reduced to the minimum, and for foot power the ease of working is increased to a wonderful degree.

DURABILITY.

The wearing parts are forged and hardened. Lost motion can be taken up with a screw-driver, thus saving cost of new parts, and time consumed in fitting them. The shuttle being carried, instead of driven, wears much longer, and skipping of stitches is avoided. The needle socket is hardened and so constructed that a needle, when broken in the bar, can be readily removed. Address

WEED SEWING MACHINE COMPANY,
HARTFORD, CONN.

MOORE'S RURAL NEW-YORKER became a household word and power in the land long before we quit "going to school," and, perhaps, needs no comment from us; still "its memory is ever fresh and green," and is renewed by its appearance every week, brimful of *good things* as ever. We are glad to announce that our predictions in the January number are being more than fulfilled. We have sent it more than *five hundred* names, and we learn that subscriptions have been pouring in in like proportions from all parts of the country, despite the hard times. Long may it continue to be what it is—a power for good in the land.—*Agent's Friend.*

Miscellaneous.

LADIES, NO HUMBUG.

Air and light, although essential to health, will spoil a fair complexion. Mrs. COOPER has discovered, by experiment, a perfectly sensible and reliable way to prevent air and light from producing tan and freckles without the use of drugs. Journal.*

Wit and Humor.

SPARKS AND SPLINTERS.

A LORD of the aisles—A pew-opener.

LOVE-AGE is the root of marri-age.

A WASTE of "t"—Putting it in depot.

TERRIBLE fellows for napping—Hatters.

SILVER wedding—Marrying a grey beard.

SUGAR wedding—Marrying a candid man.

TIN wedding—The one that pans out well.

FRUITS for balloonists—Currents in the air.

A RELATIVE position—Standing god-father.

WOODEN wedding—Marrying a perfect stick.

THE man who never told a lie has just left town.

DIAMOND wedding—When the "washings" are large."

FOX'S martyrs—Ducks, chickens, turkeys and geese.

A REAL estate man's motto—"Not words, but deeds."

IN these days no lady appears perfectly unruffled.

"TORTUOUS tanglefoot," is the latest euphemism for crooked whisky.

WHEN is soup likely to run out of a saucepan? When there is a leek in it.

THEORY may be all very well, but young doctors and lawyers prefer practice.

"THE best and oldest advertising medium" An old maid's sewing circle.

CRYSTAL wedding—When the groom is a miser and the bride is a little vain.

THE young lady who took the gentleman's fancy has returned it with thanks.

THE way for a desolate old bachelor to secure better quarters is to take a "better half."

YOUNG women should set good examples, for the young men are always following them.

THE kind of a gaiter that we don't hanker after is the alligator; there's too much snap to it.

"BEARUP & CARRAHER" is the name of a firm doing business on Grand street, near the ferry.

IN Waterloo, Ind., recently, a milkman found a bunch of shingles in his cowyard one morning bearing the inscription, "shingle your cows,"

THE "leap year neck-tie," for gentlemen, has a spring which, being touched, moves a thickness of silk aside, and shows a disc inscribed "No."

WHEN a mouse makes its appearance in a ladies' sewing-circle, the women with striped stockings on and the prettiest boots always jump the highest.

"YOUR dress." said a husband to his fashionable wife, "will never please the men." "I don't dress to please men," was the reply, "but to worry other women."

A CYNICAL man insists that the fewer relatives or friends the happier we are. "In your poverty they never help you, in your prosperity they always help themselves."

INEBRIATED gentleman who has fallen down stairs to another who offers to pick him up: "Wharzeuse slobberin' round a fella'? I allus come down stairs that way!"

TRANSMAGNIFICANBANDANDUALITY—To cure the toothache, spell the above word slowly, pronouncing the syllables and then repeating the whole word with a snap; it has never been known to fail.

A FRENCHMAN brought two mugs to the milkman in place of one, as usual, and on being asked the meaning of it, replied, "Dis for te milk, and dis for te water, and I will mix dem so as to suit myself."

A DANDY getting measured for a pair of riding boots, observed. "Make them cover the calf." "Heavens!" exclaimed the shoemaker, astounded, surveying his customer:—"I have not got leather enough."

IT took Sir Isaac Newton less than three years to thoroughly digest the principles of gravitation, while a Rhode Island farmer has spent eleven years trying to find out why a cow never kicks till the pail is nearly two-thirds full.

A LADY who loved Bulwer, entered a book-store just as one of the clerks had killed a large rat. "I wish to see what will he do with it?" she said, to a boy behind the counter. "Well," said the boy, "if you'll step to the window, you will probably see him sling it into the back lot."

STEVE—Say, Julius, wharefore you parts yer wool in de middle? Julius—To perwent compulsion ob de brain, ob course. Steve—Compulsion ob de brain! Wat's dat? Julius—Well, you is a nigorant nigger! Compulsion ob do brain is do forcin' ob de brain from one side ob de head to de oder side ob de brain. Steve—Your 'splanation am sufficiently cl'ar, Julius, but I mus' say dat dis nig don't cl'arly understan' it. Julius—'Cause yer ain't got no edderceation, Steve; yer ain't no stovedoor, if yer name am Steve, an' I ain't got no time to 'splain de science.

"WAITING FOR THE VERDICT."

The German Nurse—"Is it a Cherman or an Enklish Papy?"

The Mamma—"Well, I don't know. You see she was born in England, but my husband is German."

The German Nurse—"Ach, Soh! Zen ve vill vait to see vat Lenkvetch she vill schbeak, and zen ve vill know!"

BRADLEY'S REVERSIBLE HARROW.

(CARHART'S PATENT.)

THE KING OF HARROWS.

New and Novel. Tried and Approved. As indispensable to the Farm as a Plow. Its peculiar construction *insures lightness of draft and great strength.* Is universally admired; the common expression is, "*Just the thing we have been looking for.*" Sells at sight, as it supplies a want long felt, viz., A perfect Smoothing Harrow, combined with a first-class vertical or straight Tooth Harrow, at a price usually charged for a Smoothing Harrow. By drawing from one side (as shown in cut), we have a 4-section, hinged, 40 steel tooth Harrow; and by simply changing the draft to the opposite side, we have a perfect Smoothing Harrow. We also manufacture for the West a Harrow of the above description in 6 sections, for four horses abreast, which covers 18 feet of ground in width. Send for Descriptive Circular to BRADLEY MANUFACTURING CO., Syracuse, N. Y.

BLISS' SELECT GARDEN SEEDS

The following Catalogues are annually published, and will be mailed to all applicants on receipt of price affixed.

RANDALL'S
Practical Shepherd

A COMPLETE TREATISE
ON THE BREEDING, MANAGEMENT AND DISEASES OF SHEEP

THIS Work, by the Hon. HENRY S. RANDALL, LL. D., (author of "Sheep Husbandry in the South," "Fine Wool Sheep Husbandry," &c.,) is the Standard Authority on the Subject. It is the most complete and reliable Treatise on American Sheep Husbandry ever published, and (as the New England Farmer says) "should be in the hand and head of every person owning sheep."

The PRACTICAL SHEPHERD contains 452 pages, and is illustrated, printed and bound in superior style. Twenty-seventh Edition now ready. Sent by mail post-paid, on receipt of price—$2. Address

This is a combination of capitalists to supply the consumers of Teas throughout the United States on the mutual principle.

We have experienced agents in all the best districts of China and Japan to select Teas especially for our trade.

We expect every consumer of Teas to render us all the assistance they can in carrying out our enterprise, as we make a specialty of SUPPLYING CONSUMERS ONLY (and allow no middlemen to make any profit on our importations), which will enable us to supply them with Teas at prices lower than have ever been known, and of those fine qualities that seldom reach the interior, being sold only to the large cities and among the very wealthy.

Hoping the consumer will take an interest in our enterprise, and send at once for a circular with full explanations of how to proceed to obtain our goods, we remain,

Most respectfully yours,
Consumers Importing Tea Co.,
No. 8 Church St.,
P. O. Box 5,509. New York City.

Practical Dairy Husbandry.

A Complete Treatise on Dairy Farms and Farming,
Dairy Stock and Stock Feeding,
Milk, its Management and Manufacture into Butter and Cheese,
History and Mode of Organization of Butter and Cheese Factories,
Dairy Utensils, Etc., Etc.

BY X. A. WILLARD, A. M.,
Dairy Husbandry Editor of Moore's Rural New-Yorker, Lecturer in Cornell University, Maine Agricultural College, Etc., Etc.

THIS is the most full, practical and reliable work on Dairy Husbandry extant; indeed the only one which describes the recent great improvements in the Dairy Business. It is highly commended by leading Agricultural and other influential journals, and must speedily become (in fact is already) the *Standard and Only Authority.* It will pay every one engaged in any branch of dairy business, or who keeps a single cow, to obtain and study this work.

Floricultural.

THE CLEMATIS.

We have no motive to praise a plant beyond what those glaring merits that are apparent to a majority of disinterested and capable judges would warrant. But it is the easiest thing to become unwittingly prejudiced in favor of a particular plant or class of plants. One taste detects marks of superiority quite invisible to another. Accidental conditions may chance to provide them with every requirement that the most discriminating care could select; while the fulfillment of special needs which renders the mall but invaluable in one place, may prove in other soils and situations wholly inoperative.

With these cautionary remarks before our eyes to guard us against inveterate praise—with the possibility of incurring the disrespect of her or of him who is influenced and disappointed thereby,—we yet assert that the Clematis is the finest hardy plant in cultivation.

The incipient popularity of this plant in England dates from the production of *C. Jackmanni* (thirteen years ago)—a velvety, purplish-blue flower, named after its producer, Mr. Geo. Jackman, who was among the first—if not the first—to start experiments in crossing the several species of this tribe. His splendid results, as well as the results of those who have followed closely upon him, have effected in this plant changes similar to those which, within a very few years, have been wrought in the Gladiolus, Amaryllis,—the Pelargonium, Bouvardia, Begonia, Fuchsia, Rose, etc.—constituting altogether a glorious leap of progress that will long incite to ardent and endless inquiries in a most delicate and ennobling sphere;—a leap that elevates the science of Horticulture and gladdens mankind.

The several heads under which the Clematis has been classified may be abbreviated under (1) those which flower from the old, or last year's, wood, and (2) those which bloom from the new, or current, shoots. Among the former we select the following as best adapted to display the most pleasing characteristics of the section:

Fair Rosamond.—Rosy white; reddish bar in the middle of each sepal; fragrant; six inches in diameter.

Sophia.—Medium-sized flower (5 inches), of a lilac color and yellowish-green bar.

John Gould Veitch.—Double flower; lavender blue.

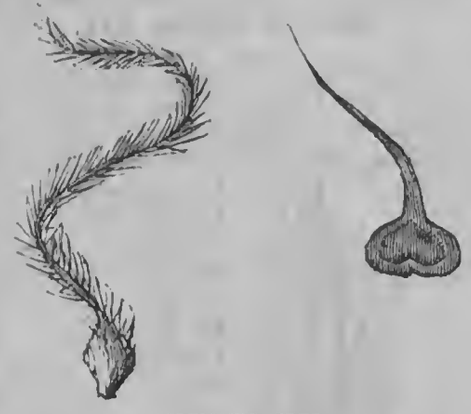
Among the latter, or those that bloom from summer shoots, we select the following:

Henryi.—This bloomed with us in a northern exposure in August, maturing buds after severe frosts. It measured 7 inches across when fully expanded. The sepals are a grayish, glistening white.

Lawsoniana.—Rosy purple; 8 inches in diameter when fully expanded.

Jackmanni.—Though one of the first, is still one of the best. Medium-sized flower, vivid purplish-blue.

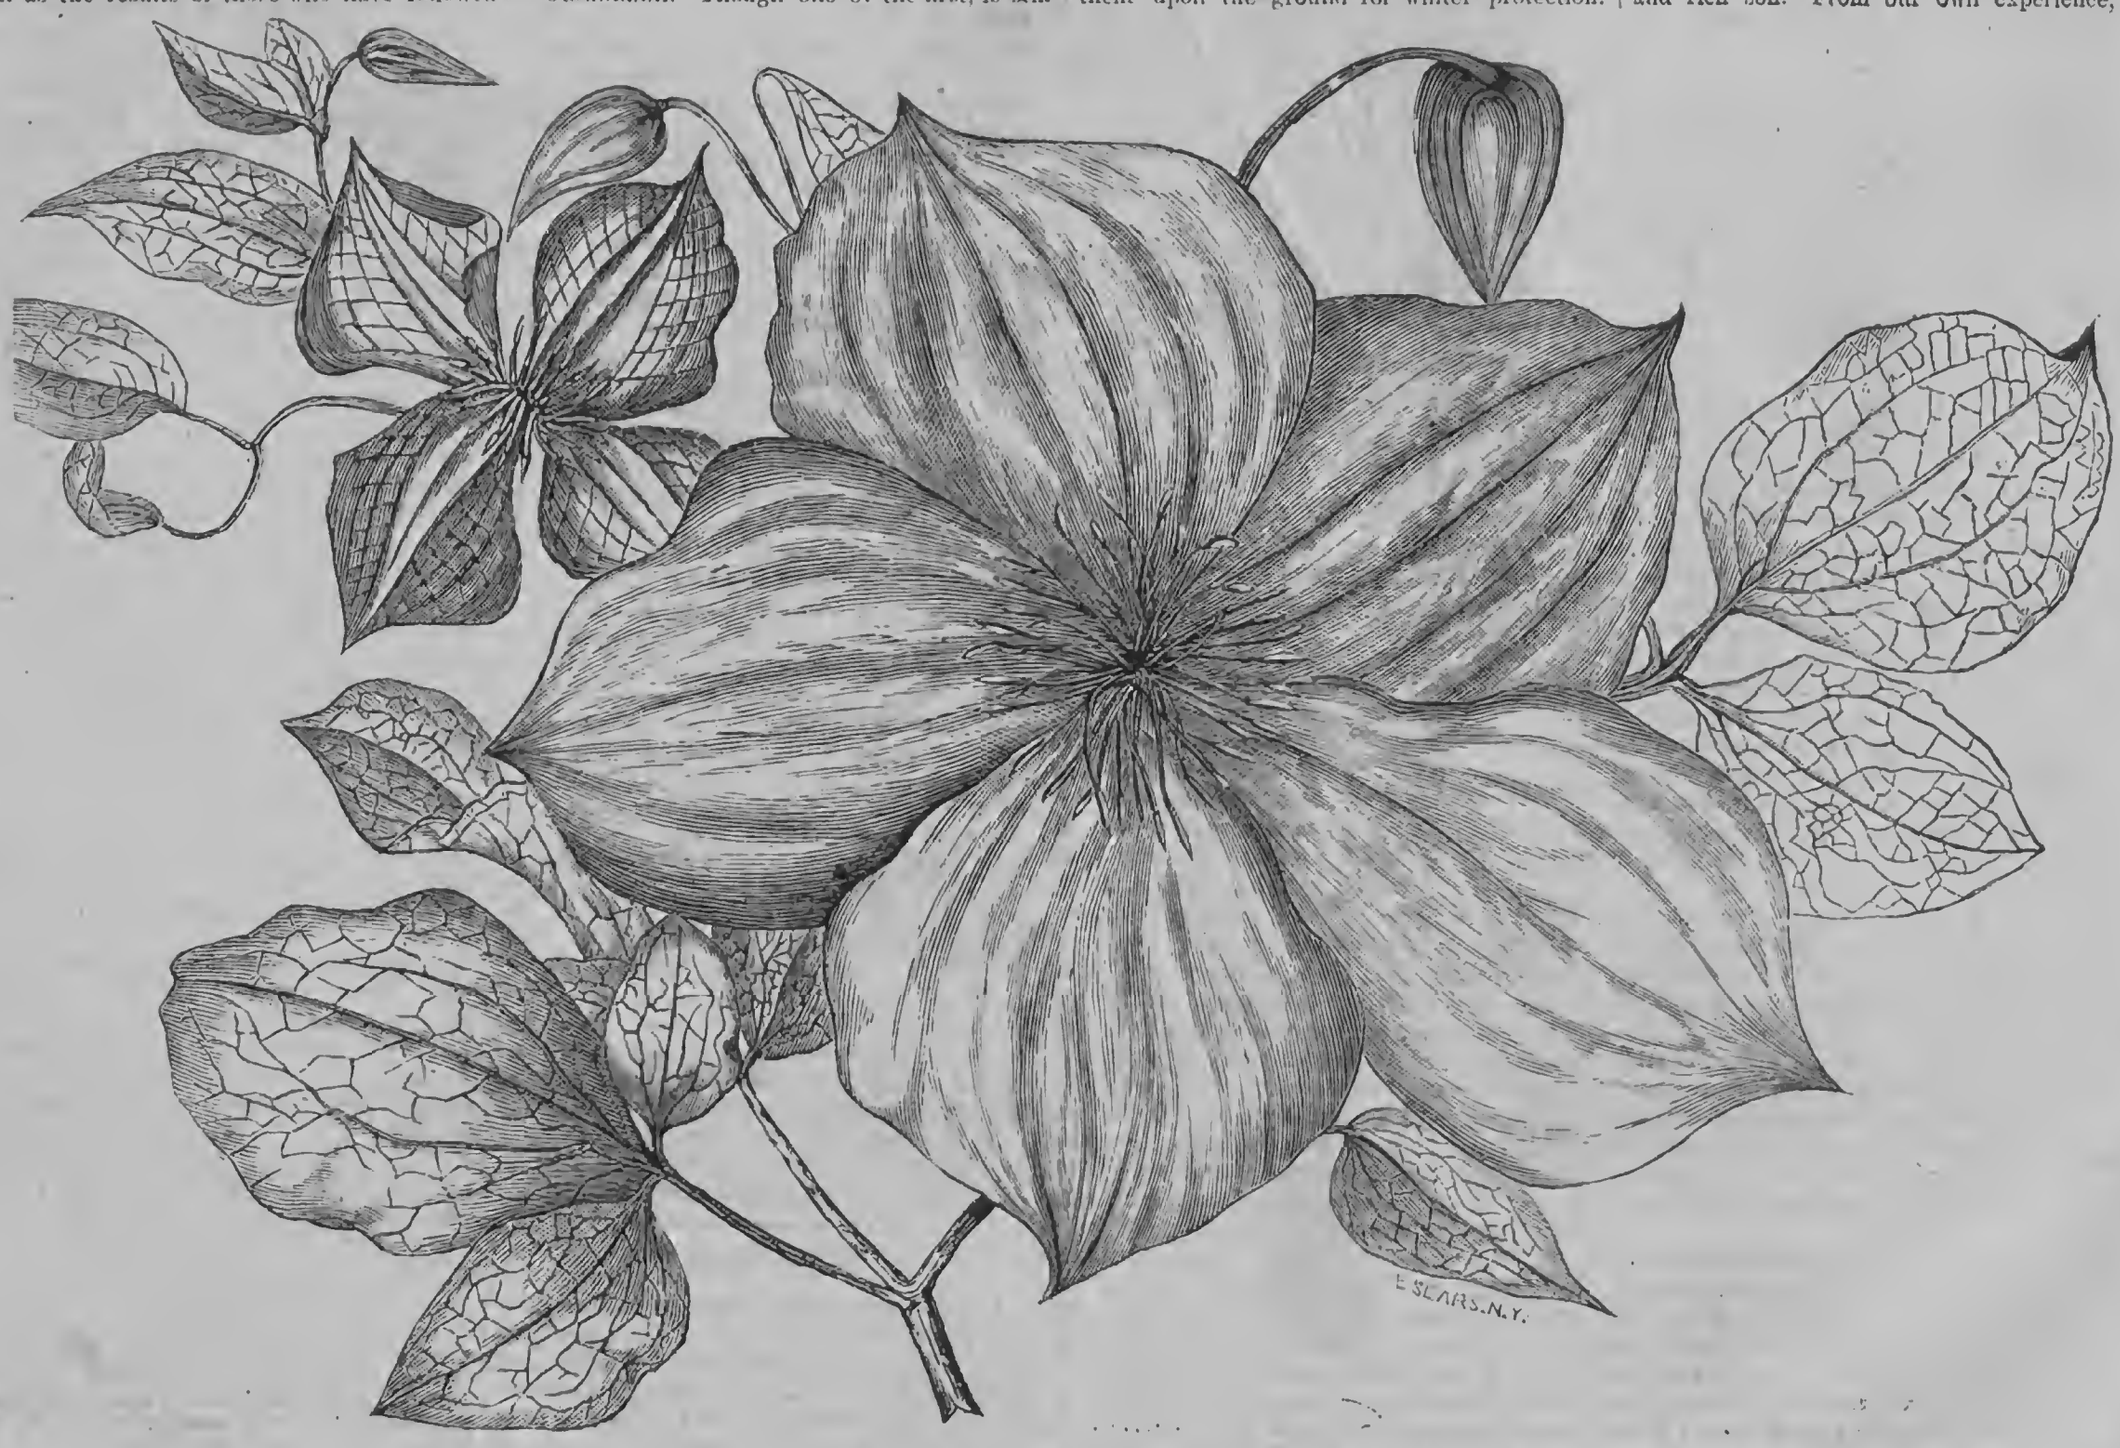
There are other varieties of an intermediate character, such as *Lady Stratford de Redcliffe*, mauve color, large flower, eight-sepaled: *Velutina purpurea*, very dark mulberry; *Henryi* (already referred to), that serve to keep up the bloom uninterruptedly throughout the entire season.



CLEMATIS SEED.

Most of the Clematises are perfectly hardy with us, and the rest so nearly so that with a slight covering they will endure our severest cold. They are rapid growers and cling by the twisting petiole, and not by tendrils. It is, therefore, quite easy to loosen them from the arbor or trellis to which they have been trained and coil them upon the ground for winter protection. The leaves, oftenest in threes, are very variable in size and form. The flowers, except when the outer stamens become petaloid, consist of a calyx only, and the sepals, as we have seen, present a rare and lovely range of colors. The achenia, or fruit, sometimes bears a naked tail, as in the Viticella section; sometimes, as in the Flammula section, a feathery tail, as we have endeavored to show in the smaller cut. *C. Flammula, Viticella, lanuginosa, Florida, Montana*, etc., natives of Africa, Japan and Europe, are the original species from which the cross-breeds of Jackman and others have sprung. *C. verticillaris*, purple flowers 2 inches in diameter; *cylindrica*, nodding, bell-shaped, bluish-purple flowers; *Viorna*, dark-purple, leathery flowers, with very feathery fruit tails: *Pitcheri*, small, bell-shaped flowers, of a dull purple, and *Virginiana*, are all native species. The last is, however, unaccountably, the only one offered by our nurserymen. It grows with coarse, rank rapidity, and is covered about the first of August with a mass of white, star-shaped, short-lived flowers, and is killed to the ground by severe cold. Its chief merit (if it has any) is the brownish, hairy, spirally-tufted fruit-heads (or achenia-tails, *les extremes se touchent*), that finally, from the fertile buds, cover the vine almost as strikingly as did the snowy flowers.

Cultural details need not be given. The Clematis will grow where the grapevine will grow, and like it will be benefited by good treatment and rich soil. From our own experience, we



THE CLEMATIS.—DRAWN FROM NATURE.

should select a peaty soil and a moist situation, if well drained. We should manure heavily, mulch every fall, and prune unsparingly, being careful, of course, to distinguish between the early and late-blooming varieties.

The Clematis is propagated chiefly by layering. In fact, we know of no instance in which cuttings have formed roots. The seeds are very slow to germinate, and will require six months, as a rule, without bottom heat. All the seedlings that we have seen bore narrow-sepaled, inferior flowers, though they may be used, especially *Flammula*, for stocks upon which to graft the finer sorts.

We are thinking that a circular bed of Clematises, arranged as we have to suggest, would prove a feature of the flower garden as lovely as anything that can be imagined. Say that the bed is 15 feet in diameter. Arrange vertical stakes at suitable distances over it—that is, stick them in the ground perpendicularly, the highest in the center, sloping to the perimeter. Connect these stakes with durable cord or wire, either with each other or in confluent lines, and train a well-selected assortment of Clematises thereon. Before the winter sets in the vines might be carefully untwined and spread about the stakes. The ground, sufficiently covered in the spring with hay or newly-cut grass, would retain plenty of moisture for the summer, and would retard, if not suppress, weeds. We should not foster extravagant hopes from this arrangement the first season. Not until the third should we look for the full beauty of these vines, that—forming a hemisphere of festooned verdure, with large flowers of pure white, rose, lilac, light-blue, deep-blue and purple, almost touching over the entire surface—would cause (we are lost for an adequate climax)—would cause the eye to sparkle with delight and the heart to dance for joy!

We need not designate at length any special place or form of culture. Grown in pots in the conservatory or window—in baskets or vases—upon rustic poles, summer houses or old trees—as solitary subjects upon the lawn, tied to single stakes, with cross-bars on the top for a spreading head—in aspects never reached by the sun's rays—for gate-posts, fences, rockeries—it is never ill at ease, and always most vigorously puts on its happiest looks. The price of the later varieties yet interferes with its appearance in every garden; but, that reduced, we cannot doubt that the Clematis will soon be as highly thought of among us as it long has been in England and on the Continent.

Our drawing, which was made expressly for the RURAL NEW-YORKER, gives a not overdrawn representation of the flowers and foliage of the Clematis. E. S. CARMAN.

River Edge, N. J., Jan., 1876.

ACHANIA MALVAVISCUS—PLUMBAGO CAPENSIS.

WE advise those of our readers who have never seen *Achania malvaviscus* to procure it. As a plant for a sitting-room, growing thriftily, needing little care, blooming incessantly, standing dry heat and dust, there are few more satisfactory. We remember a specimen of this plant that fills the whole of a store window in Jackson, Mich., not less than 5 feet wide and 10 feet high. We had occasion to visit that city once or twice a year for several years. We never saw it out of bloom.

The flowers are a bright red, bearing a general resemblance to single *Fuchsias*, an inch or more long, tubular, with the petals more twisted or contorted than in most Malvaceous plants, and a column twice as long as the corolla. The leaves resemble the Sugar Maple, but are softly pubescent. Its growth is so rapid that small plants in the spring will extend over a space four feet in diameter by fall, the branches bending over to the ground from their own weight and that of their ample foliage. In the conservatory they may be trained so as to cover wood-work as readily as a vine and there retained, if so desired, during the entire year; or they may be cut down every spring and planted in the open ground, where, with *Abutilons*, *Pelargoniums*, the double Hollyhocks, etc., they are quite in keeping.

This plant is old but, wherever we have visited, rare. We have seldom met with it either in florists' or private collections, though always admired wherever it exists. It is raised freely from cuttings or seed.

Plumbago capensis, another old plant that we rarely meet, growing beside the *Achania*, and, in common with it, covering pillars or walls, contrasting its lavender blossoms with Achania's, more numerous, though less clustered, brilliant-red flowers, would prove, we fancy, highly pleasing.

The stems of *P. capensis* are rather thick and lined with fine grooves. The true leaf is sessile, two or three inches long, broadly lanceolate, tapering toward the stem more than toward the apex, smooth and undivided. The calyx tube is half an inch long and provided with glandulous hairs, something like the stem of a Moss Rose. The slender tube of the corolla is not thicker than a large pin and nearly two inches long. The flowers are salver-shaped, one inch in diameter, with five divisions. They are borne in spicate umbels, twenty or thirty in number. The color is their striking beauty. We can only describe it as a mixture of lavender and blue of an exquisitely delicate tint. One is tempted to pluck these chaste flowers for bouquets, but they are as perishable as beautiful and wilt under the touch.

It is not a climbing plant, but like Achania, though so different in all other respects, droops from the weight of its long, elastic, thickly-foliaged branches, if unsupported. This plant is admirably adapted to rock-works and luxuriates in almost any soil. It will stand frost, and may be bedded early and left out late.

P. rosea has the same delicacy of color, inclining to rose that *capensis* has, inclining to lilac; but it requires a higher temperature, is more tender and less floriferous.

We cannot recall two plants more suitable for sitting-room corners or vases, window gardens or cool greenhouses than *Achania malvaviscus* and *Plumbago capensis*; and they are the more to be prized for the reason that, after having gladdened the house during the winter, they are ready without rest to continue their usefulness in the garden for the rest of the year.

E. S. CARMAN.

Field Crops.

NEVADA SPRING RYE.

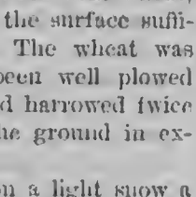
I SEND you inclosed a sample of what is said to be, by the man having it for sale, Spring Rye, and that it was first found growing wild on the Humbold River, in the State of Nevada. It is claimed to be superior for flour to any other rye, and will yield 75 bushels to the acre. As the price for such is about $1 per lb., I would like to be better posted as to its value for market before investing my money in it, and would like to have your opinion on the subject.—B. F. E., *Webster City, Iowa.*

MONTANA SPRING RYE.

A QUANTITY of this identical grain was sent to the Farmers' Club of New York City, in 1869, under the name of Montana Rye. It was noticed in the RURAL, Dec. 18, 1869, accompanied by an illustration of a full-grown head and a specimen of the grain, both natural size, which we give on this page. Soon afterward a party in N. Y. City offered the so-called Montana Rye for sale at $10 per pound. The Agricultural Department at Washington also procured a quantity of this grain and distributed it over the country. We procured a vial full of the "Montana Rye" distributed as above noted, and consequently had no difficulty in identifying your samples, even under a new name. This grain has been pretty thoroughly tested in the Eastern States, and is not considered of any value, being both unproductive and poor in quality. We have been expecting that it would soon turn up again, for such things usually come around about every half-dozen years, no matter how worthless they prove to be. Of course the story in regard to this grain having been first found growing wild on the Humboldt River in Nevada is a trumped-up falsehood, to be used in making some persons believe that it is a new variety of rye of American origin. But the facts of the case are that this grain is not rye at all, but an old variety of what is called in Europe "Turgid-eared Wheat" (*Triticum turgidum*).

It is a very large, coarse kind of wheat, making only a poor quality of flour. But in cool climates, where the more delicate and soft-grained varieties of spring wheat fail, this may prove of considerable value. The grains and heads are much larger than our common sorts of spring wheat, and wherever it thrives it yields more per acre; but the 75 bushels claimed is about 30 too much, even in Montana, where it appears to succeed as well as anywhere else in the world.

If the farmers in Wisconsin, Minnesota and other Northwestern States have not already tried this wheat, it would be well for them to do so, for it may prove to be of some value even for feeding stock, if not for bread.



GRAINS OF RYE.

A dollar per pound is rather a high price for seed, still it is not necessary for a farmer to invest more than a pound to begin with, and this amount will not be likely to send him into bankruptcy even should it be lost.

CLOVER A PAYING CROP.

SOUTHERN farmers, as well as Northern, are learning that clover lies at the basis of all good farming. It has been believed by some that clover would not succeed in the South. This we think a mistake. There is one danger to Northern clover fields from which Southern farmers are exempt—*i. e.* that of winter-killing, and this probably offsets, in most cases, the danger from severe hot and dry weather in summer. Clover has a deep root and if that once strikes down it is not easily destroyed by drouth, where the soil is rich enough to encourage vigorous growth and retain moisture. A correspondent of the Rural Sun gives the following experience with clover on a field of 20 acres of scarcely average land which would not produce 10 bushels of wheat per acre:

In 1871 I sowed this twenty acres with wheat, taking particular care to leave the surface sufficiently smooth for mowing. The wheat was sown after the ground had been well plowed with a large two horse plow and harrowed twice with an iron harrow, leaving the ground in excellent order.

In March, 1872, I sowed upon a light snow a gallon of clover seed per acre. In April of the same year I applied one thousand pounds of land plaster. The seeds and plaster cost twenty-two dollars and fifty cents, or a little over one dollar per acre. The crop of wheat yielded a little less than ten bushels per acre. After the wheat had been taken off, the clover afforded a fine pasture for many months. In 1873 the field was mowed, and produced, as near as I could estimate, forty tons of hay. I sold twenty-five tons at $12 per ton, the purchaser doing the labor of loading.

The second crop of the same year produced several bushels of seed, besides a splendid pasturage for the remainder of the year. In 1874 the field was pastured heavily, and the summer being hot and dry I thought the clover was killed out. In October of that year the field was closely plowed, sowed with wheat and the land well harrowed. Every one knows that money was very scarce in the spring of 1875, and thinking my clover killed out I was very much troubled about getting clover seed. Upon examination I found the clover coming up quite thick enough for a good stand. I applied land plaster the same as before, about one thousand pounds to the twenty acres.

The wheat crop in 1875 yielded over twenty bushels to the acre all over the field. Four acres were measured off and the yield accurately measured, producing one hundred bushels. The same four acres were in cotton in 1870, and the wheat sown in 1871 yielded scant ten bushels; showing an increase of fifteen bushels per acre in favor of clover cultivation. After the wheat was taken off in 1875, I cut from the same field a ton of clover hay per acre, and all who see it say it is excellent hay. After the hay crop was taken off it afforded a good pasture until Christmas, and now shows an excellent stand.

My outlay for seed and plaster has been less than forty dollars, and if nothing uncommon occurs in the season I do not expect to sow any clover seed on that field for a number of years, and expect the land to become richer every year.

I want to make a few figures to show what that field has produced since I prepared it for clover:

Wheat crop in 1872, 200 bushels, at $1.50 per bush..	$300
Forty tons of clover hay in 1873, at $12 per ton....	480
Clover seed in 1873.....	20
Pasturage in 1873.....	75
Pasturage in 1874.....	125
Wheat, 400 bushels in 1875, at $1 per bush.....	400
Ten tons of hay in 1875.....	100
Pasturage in 1875.....	50
Total.....	$1,550

I have said nothing about expenses, which are not as much as would have been had it been cultivated in any other crops; besides the land is very greatly improved in fertility.

I wish some cotton advocate to make as good a showing for the past four years if it can be done. No manure has been applied to this field.

WHITE CLOVER.

IN the United States this fine, nutritious grass is not valued as it should be. All the best pastures in England and also the best meadows and upland mowings of old grass land, have more or less of it, for it makes a thick bottom and adds to pasture or to the hay, and is decidedly good for sheep and for butter or cheese, and is sown on all arable land which is not strong enough to grow good red clover. For instance, I farmed on the borders of the Cotswold Hills and had arable fields in the valley running to the heading of the river Stour and up the incline to the top of the hills and there were about 520 acres, all arable, on the hills. In the valley I planted all red clover each time the rotation came round, planting up after one year on the side of the hill. I sowed red clover, white clover and rye grass mixed, but on the top substituted trefoil for red clover, sowing a bushel of rye grass seed, eight pounds of white clover and six pounds of trefoil. There were about 500 acres of old grass land in the valley and some on the slope at the commencement of the rise to the hills, which was never plowed in the memory of the then generation, and white clover was prominent as one of the great number of grasses which run to as many as 70 varieties. It is a very valuable grass and always shows green on well grazed grass land and is the main stay on lawns, and is benefitted by having sheep lie on it, hence the penning of sheep over public parks in England and in the Central Park in New York.

It is a great mistake to suppose that white clover is an inferior grass, for in reality it is the lack of this and a few other fine-fibered grasses in pastures which cause the cheese made in the United States to sell for less than the English. In England cheese is always made from cows which graze on old pastures which abound in short herbage, among which white clover is more or less to be found. Sheep do well on it and it invariably thickens when they are pastured, and it is the chief cause of permanent grass wearing out that sheep are not always grazed at some period of the year. A thick-set, short pasture is far better than tall herbage and shades the roots better for, as I have said many times before, in villages and on road sides where many varieties of animals graze close, there will be seen a green living face which continues to spring up daily and still look sweet and be eaten eagerly by horses, goats, swine and geese, while in the farmer's field near by will be seen long grass dried up brown and unpalatable with no green bottom herbage. Yet men will persist in saying there should be long grass left uneaten to shade the ground. When sheep are as numerous as they are in England and old-established grass is understood, white clover will not be slighted, and when the old pastures are occasionally mowed, it will be found this despised white clover will give an extra half ton per acre of the sweetest fattening sheep hay. A WORKING FARMER.

NEW VARIETIES OF POTATOES.

THE Editor of the Massachusetts Ploughman describes some new varieties of potatoes. Omitting the Brownell's Beauty, as it is better known than the others, we copy the description of Essex Seedling and Gillis' Prolific, varieties with which we have had no experience. It may be added that the Brownell's Beauty in 1874 rotted so badly as hardly to be worth gathering. The Essex Seedling were planted in 1874 with the Early Rose, and looked so much like them that at harvest the two varieties were not distinguishable. The Editor continues:

"Last spring we tried the Essex again from seed received through the same party, and took care to know for a certainty just where to look for them at digging time, and so well did they yield that, if we could have full confidence in any potato from only one year's trial, we should plant nothing else next year. They look, for all that we can discover, exactly like the Early Rose in every respect, only that they yielded a great deal better and the tubers were larger, smoother and more uniform. The color and shape of the two kinds are as nearly alike as could well be imagined. All visitors who have seen the tubers want a few to try, and our half-barrel will all be planted next spring, and, if they do as well another season as they have the past, we shall be forced to admit that the Early Rose, which has been the most valuable acquisition to the farmer we have ever known in this direction, has a rival with which it will be hard to compete for the public favor. The quality for the table is not enough unlike the Early Rose to require special notice.

"Gillis' Prolific is the name of a new late white potato from N. F. Safford & Son, Mt. Safford Stock and Seed Farm, Salem, Washington Co., N. Y. A single potato of this variety was received in a wrapper that was in such bad condition, owing to rough usage in the mail bags or elsewhere, that we should never have known to whom we were indebted but for a note recently received from the sender. The one potato was cut to single eyes and produced over a peck of good eating potatoes, and with only ordinary field culture. It is a good table potato, but as a market variety would fail to suit many who fancy that a potato, to be good, should have a colored skin. The public demand varies about this fancy of color in different markets, and neither a white nor a red potato should be condemned *in toto* because of its color. Practically, that potato is most desirable which will yield the greatest quantity of smooth, fair-sized, good table potatoes under fair culture.

The Herdsman.

SUGAR BEETS FOR MILCH COWS.

Just looking over the article in your issue of Jan. 1st, under the head of "Diary of a Ruralist," I find that he complains of the shrinking of at least 50 per cent. in the quantity of his cow's milk, from feeding her sugar beets: and he then asks, "Are they good feed for milch cows?"

For myself, I will answer, unhesitatingly, yes, better to produce an abundant flow of rich milk than any roots I ever fed, except parsnips; and especially far superior to turnips, being exactly the reverse of his experiment in feeding. I am satisfied something else is to blame in this, other than the beets; for whenever, for upwards of 30 years past, I have invariably cultivated the sugar beet and fed it largely to all sorts of my domestic animals, with the exception of hard working horses, both raw and cooked, and have ever found it highly beneficial for them.

No longer ago than last November, our family cow began to shrink somewhat in her milk, when we were feeding hay with additional mess night and morning of Indian meal and wheat bran half and half, with a pint of oil meal. I then directed most of this mill feed to be stopped, and in place of it, ordered a peck of sugar beets for the cow night and morning. On this change of food she began to increase her milk, and in a few days gave the same quantity that she had done previously when on pasture, and before being put up in the stable on hay and mill feed.

Sugar beets must necessarily be superior feed to all domestic animals, and especially to such as are giving milk, for they abound in saccharine juice; and to show their value for feeding purposes, as well as for making sugar, I will refer to several analyses recently made of them in England, reported on pages 24 and 25 of the London Agricultural Gazette of Jan. 3rd. These give a trifle over 7 to 14 per cent. of sugar, and over 12 to 20 per cent. of solid matter. In our drier and hotter climate, I should suppose the average percentage of sugar and solid matter would be increased in the beet crop; but this would depend much on the size of the roots and the soil where grown. To produce roots of the best quality, they ought not to be grown in too rich a soil, like that of river bottoms or the most fertile of prairies, nor should they be manured too highly in a poor soil; and what is of still more importance, probably, they ought to be grown standing so closely together in the rows, as not to exceed 5 to 6 lbs. in weight each. I prefer them even less than this, say 4 to 5 lb. on the average. I would not give a dime per bushel for great, overgrown roots weighing 15 to 20 lbs. each. I have occasionally grown detached roots of this weight, and for stock feeding found them little better than white oak chips. In fact, neither my pigs, sheep nor cattle would touch them cut up raw and placed before them, so long as they could find anything else decent to eat; while roots of a proper size they would devour with avidity, and grow fat or give great messes of milk from them.

I would suggest to "A Ruralist" to try sugar beet feeding again to his cow, but in so doing supervise the thing himself, and not trust it to any one else, as I have found that my man JOHN, as well as JACK and BILL occasionally made *mistakes* in one way, or another. A. B. ALLEN.

MEAL AND HAY FOR FATTENING STOCK.

"An Old Farmer" who has been accustomed to feed and fatten a few animals, has recorded a small item of his practice in regard to feeding raw meal against cooked meal. He writes:

"My practice in fattening beef and swine, as well as feeding cows for milk, has been to pour boiling water on as much meal as would not make the animal's bowels move too freely, at night, and in the morning; when the mush is cool, give it to the cow or pig. In covering the meal with boiling water in this way, the starch of the grain is dissolved, and the latent nutritive properties extracted, and the animal receives the entire nutriment of the grain. I have for two years past fatted two ordinary sized cows, feeding only hay, and only 300 pounds each of the former, and each yielded upwards of 40 lbs. of rough tallow. Salt was given once a week, and occasionally a tablespoonful of wood ashes. In my experience 100 pounds scalded and fed as above is equal to 200 pounds fed dry."

Live stock do not, in eating dry meal, receive more than one-half of the goodness of the meal, or there would not be so many farmers as he knows who feed from 4 to 8 quarts of meal a day to one beef creature, till they feed from 7 to 10 cwt. of meal to one animal. Those farmers never slaughter an ordinary sized beef that yields upwards of 40 pounds of rough tallow.

SCRUBS vs. GRADES.

A CORRESPONDENT of the Utica Herald, has been experimenting as to the relative profitableness of scrub and grade cattle. Probably he does not believe in scrubs much after such an experience as he reports. He says:—Two years ago I purchased 100 calves. They were of all grades, from scrubs to high grades. At the same time I had a few refuse thoroughbred calves that were not such as I desired to keep as breeders, and consequently turned them out and wintered them with the lot I had purchased. They were so kept until a few weeks since, (all together,) when fifty-one choice steers were selected and sold. Two thoroughbred Short-Horns were included. The lot averaged 1,370 lbs. The Short-Horns were again weighed, to see how they compared. One weighed 1,570, and the other 1,600 pounds, or about 14 per cent. more than the average of the whole lot, including themselves. One of the scrubs was then re-weighed, and made 1,150, or about 28 per cent. less than the Short-Horns This lot were all three old steers, and had the same fare from calves. The purchaser of these cattle placed the value of the Short-Horns at $1,-50 above the value of these common steers, which at least would be 30 per cent. Now 30 per cent. in value and 28 per cent. in size would make 58 per cent. in favor of the Short-Horns. This advantage is due entirely to the superiority of the Short-Horns as a breed, their keep being the same from calves. And this is not quite all; for a part of the scrubs are yet unsold, not being fit for market.

Dairy Husbandry.

THE VERMONT DAIRYMEN.

THE Vermont Dairymen held their Convention this year at Rutland, Jan. 19-21. The sessions during the last two days were well attended and the papers and discussions throughout were interesting and valuable.

Hon. E. D. MASON, the President, in his opening address, urged that young people be trained to accurate and careful work in their occupation. Success turns upon training, upon precision, upon patient practice. Every young man and young woman needs to know how to do something well, and this can be learned only by drill, persevering application to one thing. In conclusion, he recommended that farmers should hold on to their farms and dairies, and by industry and economy the "hard times" could be bridged over and we should again emerge into prosperity.

Mr. H. M. KENNEDY was introduced to the audience and read an interesting letter from a gentleman traveling in Switzerland, describing the manufacture of Swiss cheese

Mr. W. BLUNDING of New York explained his method of manufacturing cheese, which differs from the usual factory system, only in that he skimmed the night's vats of milk in the morning for butter making. He conducts 14 factories on this plan, and has been very successful. Mrs. W. T. ELSWORTH also read a concise and practical paper on "Butter Dairying."

At the evening session the time was mostly occupied in discussing Centennial matters, and the raising of a fund to meet expenses for a proper display of dairy goods at the exhibition. Liberal contributions to the Centennial Fund were received.

THURSDAY'S SESSIONS.

The meeting opened with a paper by HARRIS LEWIS of Herkimer on "Dairy Stock." He gave the leading characteristics of the several breeds usually employed in American dairies and their defects and good qualities were clearly pointed out. In conclusion, he said he knew of no breed of cattle that, for the food consumed, will produce so much milk, butter, cheese and beef as the Short-Horn. Dairymen may at small expense improve their herds by crossing natives with some valuable breed. Select small animals for steep hillsides and large animals for level or point-like surfaces.

INFLUENCE OF BUTTER FACTORIES.

W. L. RUTHFORD of St. Lawrence Co., N. Y., read a paper on "Butter Factories." His conclusions were that these increase the cost of manufacture and discourage the improvement of stock for butter dairying, because the cows that yield the most milk do not always produce the most butter, and as each patron is credited at the factory with the *quantity*, not the quality of milk delivered, cows are sought that will give a large quantity of milk, regardless of quality. The quantity of milk required to make a pound of butter varies from eight to forty pounds. He was opposed to butter factories because the patrons will not strive to improve their herds for butter production. In his own dairy during the past year, the herds made an average of 261 pounds of butter per cow in 9½ months, besides raising calves and supplying two families with milk. The average was 15 pounds of milk to make a pound of butter. With some cows in the highest flow of milk, it takes 46 pounds milk to make a pound of butter. The cream from the milk of Jerseys and Guernseys is more easily churned and makes a firmer and more highly flavored butter.

Mr. L. S. HARDIN followed with a paper on his improvement of the Swedish system of butter making, an account of which has appeared in these columns

CONTAGIOUS DISEASES OF DOMESTIC ANIMALS.

The above was the title of a valuable paper by Hon. T. S. GOLD of Connecticut. He said the Texan cattle disease had cost the country millions of dollars. Champaign Co., Ill., in one year lost 3,554 head of cattle, valued at $45 each. In Cheshire County, Eng., 3,671 cattle died in one year of rinderpest, and Great Britain has lost by disease cattle to the amount of 100,000,000 pounds sterling. From a disease in Egypt 800,000 oxen and as many sheep and goats were lost, ⅔ths of which were thrown into the Nile, filling it so that at one time a dog could cross on the carcasses without wetting his paws. Pleuro-pneumonia had a long incubation in Brooklyn before it made its appearance in cattle, and—through the practice of inoculation in the tail to prevent it—came to be known as the "stump tail disease." The only safeguard against cattle disease is the power to inspect seaport regions and suppress all found infected. He explained the different laws in each of the New England States on this matter. Connecticut had a commission to whom was given the power to enter premises and to quarantine the infected stock. Vermont, from her isolated position, had suffered less than other New England States, but the State should be prepared for the outbreak of disease.

Prof. CRESSY of Amherst, Mass., gave an address in which he urged the importance of education of some farmers' boys to be veterinary surgeons. It was a great advance to put physiology in schools and now veterinary surgery ought to be one of the compulsory studies in college. The New England cow doctor is generally the most ignorant person in his region, and he gave some amusing illustrations of his practice. He said there was a vast amount of disease among cattle not dreamed of. He had known a cow's lungs from tubercular disease to weigh 75 pounds that in a healthy state would weigh only seven or eight. He referred to the unhealthfulness of the meat of animals afflicted with consumption and other diseases.

THE CENTENNIAL.

At the evening session Mr. B. LANDRETH of Philadelphia, the Superintendent of the Agricultural Department of the Centennial Exhibition, was introduced and gave a detailed history of the organization of the Centennial Commission and the legislation of Congress in reference to the Exhibition.

Mr LANDRETH answered various questions put to him by members of the association in reference to the Exhibition, and a general discussion was had, in which Dr. GOLDSMITH, E. S. DANA, Col. HALLEY, X. A. WILLARD, HARRIS LEWIS, O. S. SEARTER, Col. JOHN B. MEAD and others participated.

The Committee in their report favored the exhibition of dairy products, and that sufficient funds may be guaranteed to make the enterprise a success. It recommended also that aid should be asked from the State.

FRIDAY'S SESSION.

The first paper in the morning was read by Gov. E. H. HYDE of Connecticut, in which he gave a brief history of the progress in agriculture. This was followed by an address from X. A. WILLARD of New York on "The Philosophy of Curing Cheese."

Mr. A. W. CHEEVER of Massachusetts, read a paper on the improvement of pastures. He said more feed can be produced from one acre with ten varieties of grass than from ten acres with one variety. He urged, therefore, that when grounds are seeded for pasture, a great variety of seeds should be sown. Pastures may be kept in good condition for many years, if not overstocked. He urged an unceasing warfare upon weeds. Thistles can be killed by cutting the stalks before the bloom. Understocking also injures pastures, because the rank growth of grass left by stock runs to seed. The grass should be fed as it grows.

Mr. CURTIS of Syracuse closed with a paper in which he gave a general review of different theories in regard to butter making which had been presented at the various conventions during the winter.

The Secretary, Mr. O. S. BLISS, was indefatigable in his labors to make the convention a success. The discussions were animated and well sustained, and all went away highly pleased with the result of the meeting.

FANCY SHIPPING CHEESE OF HERKIMER COUNTY.

THE following is the process for making "gilt-edged" fancy cheese for the London market at one of the most noted factories of Herkimer Co., N. Y.:—In warm weather during summer, the milk is cooled by running water under the vats to a temperature of 70 deg. Fahr. The water is then turned off for the night and the agitator kept moving very slowly until morning. If the weather is cool in summer the water is turned off when the milk has fallen to a temperature of 74 deg. In the morning the temperature of the milk ranges about 64 deg. Fahr. Mr. FAIRCHILD, the manager, says he does not want the temperature of the milk to have fallen below 64 deg. in the morning because, when this is the case, the milk is too sweet or has not sufficiently ripened for his method of cheese making. In summer the milk is raised to a temperature of 82 deg. Fahr., and a sufficient quantity of good, sweet rennet added to produce coagulation so it will be fit to cut in one hour. The coagulation should be carried so far as to have the mass break smooth and clear on introducing the finger and raising it.

Then the curds are cut lengthwise of the vat with a gang of steel knives, and allowed to remain at rest for a space of ten minutes. They are now cut crosswise, and immediately after this operation the horizontal knives are used to divide the perpendicular columns of curd, and when this is completed no more cutting is allowed. Heat is now immediately applied to the mass, and its temperature is raised slowly or gradually until it reaches 98 deg. In the meantime, the curds are very carefully moved with the hands and the particles of curd are about ⅝ths of an inch through. Water is used under the vats for heating, and this is regarded as better than dry steam. When the mass has reached a temperature of 98 deg., heat is shut off; but in equalizing the temperature of the water under the vat and the curds, the latter will run up to about 100 deg. The curds are now stirred for from ten to fifteen minutes and very slowly, or until the heat is all equalized through the mass. Then the curds are left at rest—the cheese maker's office being to watch and stir the curds occasionally until the acid begins to develope. It generally takes about an hour for the acid to develope sufficiently during hot weather, and when this point is reached which is indicated by the odor, or if the hot iron is employed the curds should only spin threads about ⅝ths of an inch long. At this point, which must be determined correctly by the cheese maker, the whey is immediately drawn and the curds dipped into the sink. They are here stirred until the whey is all out, when salt is applied at the rate of three pounds salt to 1,000 pounds of milk.

A proportion of annattoine is used during summer in the milk, as the London dealers to whom the cheese goes on orders, require a colored cheese. The annattoine proportion is after WHITMAN & BURRELL'S recipe, and takes one teacupful for 1,000 pounds of milk. This gives the desired shade and suits the London trade exactly.

In spring and fall, when the patrons are allowed to skim a portion of the milk, the process of manufacture is varied, and is as follows: The milk is set at a temperature of 84 deg., and a quantity of rennet added sufficient to produce coagulation completely in 40 minutes. It is then cut in the same way as for whole-milk cheese and the mass raised to a temperature of 96 deg., which ultimately runs to 98 deg. in equalizing the temperature of the water and curds. The late fall cheese is salted at the rate of 2¼ to 2½ lbs. salt to 1,000 lbs. of milk and the winter cheese gets only two lbs. For this character of cheese he does not want so much development of acid as for the summer make. When under the hot iron test the acid is far enough developed when you can just perceive the strings to start on withdrawing the loops of curd from the iron. In winter he regards it important to draw the whey as quickly as possible and get the curds in the hoop rapidly.

SKIMMED MILK—VALUE WHEN FED.

It is a question often discussed by dairymen whether they can afford to feed skimmed milk to animals, and any experiments showing its value must be a help to form opinions and guide future action on this subject. At the recent Annual Meeting of the Illinois State Dairymen's Association, Mr. I. H. WANZER made a statement giving the result of his experiment in feeding skimmed milk. On the 10th of November he took five calves whose united weight was 257 pounds, and five shoats whose united weight was 487 pounds. The calves were fed 30 days on skimmed milk, consuming 420 gallons, and gained during the 30 days 300 pounds. In the same length of time the hogs consumed 480 gallons and gained 173 pounds. He concludes from this that the hogs are worth 6c. per pound; the milk is worth as food for hogs at the rate of 2⅓c. per gall. The calves, on the basis of being worth 4c. per pound, would make the milk worth 2⅔c. per gallon. The value then of skimmed milk when fed to animals, he thinks is at least 2½c. per gallon.

Now if we should assume that a gallon of skimmed milk would, on an average, make ⅝ths of a pound of cheese, and if it cost 1@1½c. to manufacture and furnish it for market, then the ⅝ pound of cheese would cost 4c., or at the rate of about 5c. per pound. In other words, skimmed milk, when fed to animals yielding at the rate of 2½c. per gallon, would give the dairymen the same amount of money that it would if made into skimmed cheese at 5c. per pound.

If our reasoning and figures are correct, the relative value of skimmed milk for feeding or for cheese making can be easily determined and the profits from one or the other procedure will depend upon the price obtained for the cheese in market. It will be proper to say, however, in this connection, that Mr. WANZER puts a higher value on skimmed milk for feed than that obtained by some other experimenters.

Pomological.

WHY?

If a person asks about fruit planting and what varieties to plant, we almost invariably see recommended the Wilson Albany Strawberry, the Concord Grape, the Bartlett Pear, &c. Now, why is it? In this section the Concord Grape is almost always below par in quality and is often worthless; on the other hand, the Delaware is always of good quality, above most others, and its yield is greater than that of any other grape known here, except the Clinton. I know some claim that the Delaware is not successful on as wide a locality as the Concord, but from all I have read or can gather from private correspondence, I find, as a rule, that where the Delaware fails it is through lack of proper soil, the land is too light or poor, and the grower is too heedless or ignorant to enrich it properly. I have the past fall seen Delawares growing and bearing in a light, sandy soil on a gravel subsoil; but the owner had put plenty of muck in the hills and made the ground rich.

You need not think that the seasons are so short here that we cannot grow any other grapes, for one grower has the Isabella, and he gathers full crops about four years in five, and of the Delaware he has failed to get a full crop only once in twenty years.

We have now only the Clinton and Delaware, but propose to set in the spring the following: 800 Delaware, 50 Concord, 50 Eumelan, 50 Salem, 30 Lindley, 30 Wilder, 30 Agawam, 30 Janesville, 30 Worden, 30 Barry, 30 Diana, 10 Croton, 10 Walter, 10 Creveling, 10 Massasoit.

If you can give us any hints on the distance apart of planting, &c., you will oblige us. We thought of setting the rows six feet apart, and the plants—strong growers, eight feet apart: weak, six feet apart.

On strawberries, the largest crop of Wilson's I know of is that of J. M. Smith of Green Bay, three miles from here. From one-quarter of an acre he gathered 111 bushels and 19 quarts, or at the rate of 446 bushels and 12 quarts per acre. His soil is sandy. Now, Mr. J. Knox raised fine varieties, such as Jucunda, Triomphe de Gand and Fillmore, at the rate of from 300 to 500 bushels per acre. His soil was a clay. Now, why should we, on a heavy soil, bother with that poor, sour excuse for a berry when we can grow such fine ones with just as good prospect of success?

In raspberries we usually depend on the Philadelphia, as it is only about once in three years that we can sell at a paying price, owing to the wild ones with which the market is flooded, and the blackberry season, which follows. Blackberries (wild) often sell for two cents per quart on the streets during the hight of the season. However, for home use, a few of Brinckle's Orange and Fastolff may be grown, and by bending down and pegging fast, so that they will be covered with snow, they will bear well and thrive.

If I was to advise any one what to plant in this section, it would be:—Delaware Grape, Jucunda, Triomphe de Gand, Nicanor, Wilson, Charles Downing, Kentucky and Green Prolific, Strawberries, Red Dutch Currant, Houghton Gooseberry, Philadelphia Raspberry, Flemish Beauty Pear, Lombard Plum, Kentish Cherry and Tetofsky, Duchess of Oldenberg, Haas, Famense, Plumb's Cider, Alexander, St. Lawrence, Pewaukee and Northern Spy Apple.

A. M. Van Auken.

Fort Howard, Wis., Dec. 28, 1875.

There is no reason excepting habit for recommending for universal use inferior varieties of fruits, and experiments such as our correspondent is making should be inaugurated in every locality to decide what good varieties are best adapted to it. His list for Wisconsin is a valuable contribution to our pomological knowledge of that State and for Wisconsin, on his recommendation, we heartily indorse the advice to "plant Delawares," instead of the thousand times repeated advice to every locality to "plant Concord." We have no ill will toward the latter variety, but the unceasing recommendation of it everywhere is becoming monotonous. Let us try something else for a while for a change. As for strawberries, something is to be said for the much-abused Wilson. Its "sourness" especially adapts it to canning, and when well ripened Wilson has a good flavor and is not too sour for many fastidious palates.

POTASH IN FRUIT GROWING.

Failure of a fruit crop may result from a variety of causes, prominent among which are attacks of insects; but unhealthfulness in the tree itself indicates that the soil has lost some fertilizing substance essential to the growth of the tree. Most manures applied to orchards are mainly carbonaceous; but, excepting for their influence in ameliorating the soil, it is doubtful if carbonaceous manures are of much value. Carbon is supplied by the atmosphere in unlimited quantities, and it is probable that the carbon which composes most of the wood comes to the tree through the leaves. Not so with the ash, the mineral substance which remains after burning can only come through the soil, and, as the tree becomes larger, the soil gradually loses in this element until it becomes nearly barren. Possibly the injury of trees to soil, aside from their shade and abstraction of moisture, may be remedied by supplying these mineral elements—potash, lime, sulphuric and phosphoric acid.

AMERICAN HAY TEDDER.

The subject is well worth a trial. There can be no doubt that the vigor and healthfulness of the tree itself requires one or more, or perhaps all, of these elements.

Fruit bearing trees especially are subjected to an unusually heavy strain, like in degree to that which the domesticated animal sustains in comparison with what it does in the wild state. The wild hen of India's jungles lays only a few eggs, where the domesticated hen lays hundreds. Wild cattle suckle their young only a few weeks; but the domesticated cow is required to produce a much larger supply of milk and continue it, often ten, twelve or more months at a time. Trees in woods bear very little fruit. In the fierce struggle for existence among dense masses of verdure, nature gives every effort to producing vigor and luxuriance of trunk and foliage. A cultivated, fully-grown apple tree will often yield ten barrels of apples per year, and this means exhaustion—not of carbon or sap, but of mineral elements. The stone fruits, such as peach, plum and cherry, are rich in potash, and when many successive crops are produced no wonder the trees begin to fail.

Thousands of old cherry trees are dying in many localities through no natural disease, but from sheer starvation for potash, lime or phosphoric acid. Is it not possible that the early rotting of peaches, and possibly of other fruits before they reach perfection, may be due to the same cause? We have heard of a man who has grown Hale's early peach successfully, and not been troubled by early rot; but he used wood ashes freely around his peach trees. In some localities Hale's Early rots badly, and in others no complaint is found. May the difference in results not be owing to variation in the mineral elements of soils? These are interesting questions, and we hope experiments will be made to give them a satisfactory answer. It is quite safe to apply mineral fertilizers of almost any kind to old orchards, with a strong prospect of improving their productiveness. This much of practical value is pretty well settled. As for the theories to explain the facts we can well afford to wait for them.

Industrial Implements.

THE HOLBROOK SWIVEL PLOW.

For farmers in hilly localities the swivel or reversible plow is almost a necessity. It has often occurred to thousands of others whose fields were level and easily tilled, that it would be a great convenience to have a plow which would make the field in one land with smooth surface and not a ridge or dead furrow. Various difficulties have attended the making of such plows: but we believe they have all been removed, and the swivel plow as now made does its work well and works with equal ease in turning the furrow right or left. Messrs. Everett & Small, 10 South Market St., Boston, Mass., are the successors to F. F. Holbrook & Co., in the manufacture of the well known Holbrook Swivel Plow, which has received the hearty commendation of practical farmers in every section of the country. As soon as the success of this plow is understood by the mass of farmers, it is destined to come into very general use, not perhaps superseding others, but as specially adapted to certain soils and localities. The old objection to swivel plows that they run on edge too much and were difficult to hold, is entirely removed by the new movable cutter, and with this improvement the swivel plow becomes, at least, equal to any other for ordinary level plowing, and superior for side hill culture. Messrs. Everett & Small have all the patterns for this plow, and can at any time promptly furnish extra parts or repairs, should any thing be broken. Farmers interested in this subject should send to them for circulars giving further particulars.

THE AMERICAN HAY TEDDER.

It is often important, especially in such a "catching" season as last summer, that hay should be got into barn as soon as possible after cutting. The mowing machine, cutting down eight, ten or twelve acres per day, may only become so much greater loss unless equal facilities are provided for seasoning it. The Hay Tedder and Sulky Rake are companion pieces in the hay harvest with the Mower and Horse Hay Fork. With these the severe labor of an old-fashioned haying is reduced to its minimum and the season becomes in reality, as too enthusiastic poets have long described it, one of sport and gayety. Believing that many of our readers would wish to procure a Hay Tedder, we have included it in our Premium List and will furnish one costing $80 for eighty subscribers at club rates or sixty at $2.65 each. The machine is strongly and simply made, and can be driven by a small boy without difficulty.

The Poultry Yard.

HENS—LARGE EATERS VS. SMALL.

I must differ with your correspondent upon this subject, page 10. Fowls that eat most *are not* the most profitable to keep. Some breeds (Brahmas in particular) are disposed to overeat to such an extent that their food is not fully digested, consequently there must be waste. Their lazy habits are against them.

Are cattle, sheep, hogs and horses that eat the most the most profitable also? Does the man that swallows the most food do the most work? Or is poultry the only kind of stock to which this rule applies? Again your correspondent is mistaken as regards Houdans and Leghorns not laying in the winter months. Either will lay equally as well as the Brahmas, or at least they do with me. The amount of food required to raise one Brahma hen to two years old will raise two Leghorns to the same age, and the chances are you will get double the number of eggs. While eggs sell by count large eggs are not so very desirable for market. If poultry is raised for the meat, then the Brahmas are a desirable breed.

Syracuse, N. Y. Nelson Ritter.

COOK YOUR POULTRY FOOD

In part, and feed it, at least, once a day this cold weather (in the morning is the better time), while it is hot. Mix with this soft feed, which should be composed of meal and vegetables, a little salt, and occasionally a small quantity of powdered charcoal and pepper. This renders it warming, cleansing, and palatable to the birds.

The value of potatoes, turnips, etc., thus cooked with bran and corn meal, is not generally appreciated; it keeps the fowls in good heart, and is altogether economical as well. The scraps from the table can be used up with this feed, and all the dry bits of the family may thus be utilized. If you keep but a few fowls, one-half their cost of feeding may thus be saved. If you have large numbers to provide for, the expense for food is greatly lessened, in the long run, by this process, and your birds will be quite the better for this treatment, instead of limiting them to dry grain and "cold victuals" continually. Fresh vegetables are valuable for their nutritive material, and for the assistance they afford in digestion.—*Poultry World.*

Patrons of Husbandry.

GRANGE NEWS AND NOTES.

The Ohio State Grange met at Cleveland February 8th.

The Grange at Homer, Illinois, has started an agricultural library.

Richmond Valo (Ga.) Grange is discussing the advisability of holding a fair during the coming summer.

Mrs. Laura E. Lyman of this city has been appointed by the Ex. Com. of the N. Y. State Grange as Purchasing Agent for ladies' dry goods, house-furnishing goods, music, musical instruments, etc., and given the requisite bonds for the faithful performance of her duties.

A writer in the Indiana Farmer says that last spring a member of his Grange, No. 1,489, had the misfortune to get a kick from a horse that disabled him for the season. The Grange gave him about money enough to pay for a hand to cultivate his crop. The members of the Grange assembled in the fall and cribbed the corn of a brother who had typhoid fever.

The Seneca Co. (N. Y.) Council installed the following officers in the fine Hall of Rose Hill Grange, Waterloo, Jan. 22.:—E. S. Bartlett, M.; J. G. Pearson, O.; J. C. Whiting, L.; J. G. Lewis, S.; Lewis Opdyke, H. S.; Henry Trantman, C.; E. F. Strong, T.; E. J. Schoonmaker, Sec.; Homer Stone, G, K.; Laura Bockoven, C.; Libbie Wayne, P.; Henrietta Barnes, F.; Nina Goodman, L. A. S.

Bethlehem (N. Y.) Grange No. 137, installed the following officers, Jan. 26, by Deputy Jurian Winne:—Walter T. Hotaling, M.; D. A. A. Nichols, S.; D. N. Mead, T.; James Van Duzen, O.; W. H. Singerland, L.; D. Conse, C.; William Bullock, S.; Daniel Walley, A. S.; Abram Fitch, G. K.; Mrs. W. T. Hotaling, G.; Mrs. A. Fitch, G. K.; Mrs. W. T. Hotaling, C.; Mrs. A. Fitch, P.; Mrs. John S. Russell, F.; Mrs. P. H. Van Deizee, L. A. S.

A Pomona Grange was organized Jan. 21, at St. Johnsbury, Vt., by Worthy Master Colton, of the State Grange, comprising the counties of Caledonia and Essex. Over seventy-five members enrolled their names. Jona. Lawrence, Master of Green Mountain Grange No. 1, was elected Master, and George D. Mears, of Excelsior Grange, (Post-Office, Peacham), Secretary. The officers of the new Grange was installed by Brother A. B. Smedley, Lecturer, of the National Grange, in a very acceptable manner. The new Grange starts off with flattering prospects.

The Yates Co. (N. Y.) Grange has elected the following officers for 1876:—Master—Harrison H. Sisson, Penn Yan. Overseer—Peter L. Dintuff, Rushville. Lecturer—Edwin H. Nutt, Dresden. Steward—Alfred S. Becker, Benton Center. Assistant Steward—Selah Crosby, Barrington. Chaplain—David Palmer, Penn Yan. Treasurer—B. F. Freeman, Barrington. Secretary—Wm. T. Remer, Penn Yan. Gate-keeper—Thomas Emery, Penn Yan—Ceres—Mrs. Alfred S. Becker, Benton Center. Pomona—Mrs. Edwin H. Nutt, Dresden. Flora—Mrs. William Becker, Branchport. Lady Assistant Steward—Mrs. Guy Shaw, Penn Yan.

An Alabama Grange has appointed a committee to visit the farm of each member of the Grange, and to report in writing the state of the growing crops; condition of farm and fences; condition of stock; methods of cultivation; rotation of crops; kinds of crops raised and the varieties of each; varieties of fruit raised, and the condition of farm buildings. These reports are not for publication, unless the owner desires, but are to form the subjects for discussion at future meetings. Such Grange work can not but be profitable to the community in which it is situated, and could be initiated by other Granges with much benefit.

The Grange in Greencastle, Ky., is inaugurating a needed reform in reducing the prices paid undertakers for conducting funerals. There, as elsewhere, the business has been a monopoly, and extortionate prices for funerals have been demanded and paid, because there was no other alternative, and relatives of the deceased did not care to make any complaint, which would only expose them to ridicule and misrepresentation. Hereafter a member of the Grange will have hearse and coffins in every style, all at less than half the rates usually charged. This sounds only like a down east Yankee movement, but we are glad to say the idea originated in a Kentucky brain. It is a good sign to see the Southern mind running to economy in new and unexpected directions. The return of prosperity under such circumstances cannot be far distant.

The Vineyard.

A NEW GRAPE—THE BRIGHTON.

THE introduction of New Fruits is the occasion of so much pleasure, and also of so much disappointment, that a few words, preliminary to speaking of the one whose name appears above, are desirable as showing what may *not* be expected of our best *new* fruits.

A careful examination of our most esteemed fruits shows that there is one general law under which they all come—a law not so much of *improvement* in the full sense of the word, as of *variation*, or improvement in one or more respects. This improvement in one direction is obtained at the expense of some other feature, so that as one peculiarity rises, another must fall, in order that the balance of forces may be preserved. For instance, if size of fruit increases, number or quality must fall; if great vigor and hardiness of plant are obtained, delicacy of texture or fine flavor, or abundance of fruit, must be sacrificed to some degree; if fine flavor, great delicacy, and beauty are secured along with productiveness, hardiness, or rapid, vigorous growth is so diminished that extra care, manuring, and perhaps winter protection, will be required to secure satisfactory results. We cannot by cross-breeding add one desirable feature, and then another, and so on until all imaginable excellencies are obtained in one *new* sort.

All our finest fruits, flowers, vegetables, grains, and even domestic animals, come under this universal law of *variation*, not improvement, for not one of them has *ever improved* (so far as we have any knowledge), except so far as to be improved for us by a variation which fits it for a special purpose. Every "improved" fruit, flower, vegetable, grain, or animal, in the sense in which they are commonly considered "improved," would perish and become extinct, if the care of man were withdrawn; their excellences (as we call them) becoming their deficiencies under changed conditions. This being the case it is useless to look for all the excellences of any fruit in one variety; quite a number of sorts is desirable in a fruit covering as long a season, and as many uses, as does the apple, the pear or the grape, in order to secure complete satisfaction and answer special uses. A variety of any important fruit which embraces a *good balance* of qualities is wonderfully useful to the general public, who must plant but few specimens, and make those answer all purposes. The Baldwin Apple, the Bartlett Pear, the Concord Grape, are instances of this kind of value very well known to us all.

The "Brighton" Grape, illustrated herewith, it is believed will take its place among the fruits which have this desirable combination of qualities which is so necessary to the general public. Its recommendations are—

1st,—*Excellence* of *quality*. It is equal to, or better than the Delaware in flavor, and richness, with even less pulp; very sweet, pure and delicate in character; an excellent table fruit.

2d.—*Vigor* and *Hardiness* of *Vine*. The vine grows with great rapidity, ripens its wood early, and proves fully as well able to stand severe cold as the Concord.

3d.—*Early Ripening*. The Brighton ripens along with the earliest good sorts, the Delaware, the Eumelan, and the Hartford. This is a peculiarity of especial value at the North and in the Middle States, in many localities.

4th.—*Beauty* and *Size* of *Fruit*. It is as large, and as beautiful as the Catawba, which it resembles in color, and form of bunch and berry.

5th.—*Beauty* of *Vine and Foliage*. The Brighton vine has very large glossy, dark-green leaves, which are very attractive and promise to be free from disease in most localities. This can, however, only be decided upon, by actual trial for several years and in many places.

The engraving is an accurate copy of a photograph, of a portion of the trellis upon which the original vine is growing. It was taken Sept. 18, 1875, at which time the fruit was ripe, and fully as mature as the Delaware or Hartford prolific.

This new grape shows what may be effected by the careful artificial fertilizing of one variety of fruit with the pollen of another. It was raised by JACOB MOORE, Esq., of Brighton, N. Y., through crossing the Concord and Diana Hamburgh. The infusion of a strain of the Hamburgh blood has doubtless given to it some of its great excellences, while the preponderance of the native (Concord and Diana) element, preserves to it great vigor and hardiness of wood and sufficient strength of leaf, to carry and mature the fruit and wood in any season or locality at all favorable to grape growing. It may not withstand all the vicissitudes which the Concord will, but no doubt will equal or surpass any of the Rogers' grapes, or other varieties crossed with the foreign sorts. We must be content to sacrifice some of the ruggedness of the wild or original types of the grape, to secure the elegant and excellent peculiarities found in this, and some other new grapes which will ere long make their appearance. How much of care and attention any man is prepared to give for the best and highest results in fruit culture, is, in this, as in other cases, for each one to determine for himself. Every really good thing costs something.

Industrial Topics.

A VERMONTER ON SUGAR MAKING.

Now, that other farm crops do not pay very well, perhaps farmers who have some maple trees left will turn their attention to sugar making. If they should, the sugar would be nearly clear profit, as the work comes at a time when little else can be done on the farm, and the fuel used is generally what would otherwise be left to rot in the woods and go to waste. Some farmers annually make several hundred pounds of excellent sugar besides molasses, and at a very trifling expense. From an essay on sugar making by S. H. FOSTER of Calais, read before the Vermont State Board of Agriculture we take the following:

I have but little choice between tin and well painted cedar tubs; all things considered, perhaps, would take tin. I use two kinds of spouts; round tin which drives just outside the incision, and flat tin. A three-eighths bit is large enough to bore with; never use wedge-shaped nails, as they check and injure the tree; ross the bark lightly and smoothly with a sharp hatchet or ax. Keep the storage tubs under cover, that the sap may be exposed to the sun as little as possible; gather often, and convert it into sugar as soon as settled. The sugar house should be large enough for storage tubs, boiling apparatus, wood; and there should be a clean, cool room for sirup and sugar; also a partition between the storage tubs and arch. A separate arch for sugaring off, is an absolute necessity. For boiling, Cory's evaporator is the best thing I ever used; it works on the right principle, is easy to manage, makes better sugar, and saves at least one-third of the wood. The arch should rest on a good foundation, that the evaporator may be kept as nearly level as possible. The sap should run through a coarse strainer into the feeder, and from there to the evaporator through a fine one. Within two hours after starting your fire, draw off sirup; after that, once in thirty minutes; turn it into tin cans; when fairly cooled and settled, drain off, strain through flannel, and sugar off in small batches as rapidly as possible. Let it cool in the pan, stirring a very little, and when just right, it will turn out without adhering to the pan but little.

The longer you are sugaring off, the darker will be your sugar; hence, in a common pan I would put sirup enough for forty or fifty pounds of sugar, build fire enough at the start, and in thirty or forty minutes it will be ready to take off, nine times out of ten, without using ladle or sweet cream. It is better to clean the pan after each batch; the rinsings of the pan and settlings should be boiled by themselves, or made into vinegar. When boiling continually, the substance called niter, which collects in the back end of the evaporator, should be removed every thirty-six hours, or the sugar will be injured thereby. Clean the holders and drawing tubs often, and when the tubs begin to be sour, it will pay well to rinse them out. The wood need not be sound, or of the best quality, but it must be dry. If possible, before leaving the sugar yard, get your wood for the next spring; if not, make it the first business after spring's work; but never wait until late fall or winter.

How often we hear the remark, "It does not pay to sugar, when I can buy for six or seven cents a pound." It pays me to sugar, and generally pays the best when I am ready to commence as soon as the sap begins to run; for one pound of the first is worth two of three of the last. In the spring of 1862, while many were waiting for the line storm, and what else I cannot say, I tapped one thousand trees, and in a few days had one thousand pounds of nice sugar; sent it to Montpelier, and received ten cents a pound in cash, the highest price paid for maple sugar up to that time. Well, the line storm forgot to come; therefore many did not sugar that spring. Last spring I tapped one thousand trees and made four thousand three hundred pounds; the spring before, I made six thousand eight hundred pounds from one thousand three hundred trees, and for the last four or five years it has averaged me about thirteen cents per pound.

SPECIAL MANURES AND THEIR USES.

Of course the most certain and most reliable of manures is that which is always most easily procured—that from the stable. But altogether it costs considerable. Usually a purchase price is paid for it at the stable, it is then hauled a greater or less distance, and is handled from two to four times before it is under the surface. It behooves us then, to always use it to the best advantage.

Generally I know of no objection to the use of fresh manures, except that if applied heavily they trouble in fitting the ground for fine seeds. On the contrary, I have always noticed very good effects from the use of long manures, and advise piling manures only when no ground is prepared to receive it. But this period covers a considerable portion of the year and much of it must be piled. If left thus in warm weather without further attention, fresh manure invariably fire fangs—burns up—and loses nearly all its virtues, till it is worth little more than so much chaff. To avoid this, after several days hauling of manure we give it a good drenching with water.

C. .

RHODE ISLAND has 1,415,734 cotton spindles against 814,555 in 1860. This increase represents a large part of the wealth and prosperity of the busy little State.

Insurance Department.

INSURANCE NOTES AND NEWS.

Wise and Timely Counsel.—Two or three years ago, when the financial condition of the Universal Life Insurance Company was no better than it should have been or is now, the officers issued a circular, or annual address, to the policy holders, containing some most excellent advice, which is just as good and appropriate now as it was then. They said:—"Should you be approached by the agent of another company with a view to induce you to make a change of *companies or policies*, consider—First, that the object in view is not your benefit, but that of the person soliciting the change, who will profit by it to the extent of the commissions he is to receive upon the new policy. Next, that in making the change you will certainly incur loss, not only of the premiums you have already paid, but also, most probably, through having to pay a higher premium in consequence of increased age. In such cases, justice, not less to yourself than to the company in which you are insured, dictates the proper method to pursue. Ask the person soliciting the change to give you, in writing, the points he urges in favor of it, with a view of submitting them to the officers of your present company for explanation. Should he decline to do this, you have *prima facie* evidence that he himself is trying to deceive you." This is most excellent advice to the policy holders of the North American Life Insurance Company, whom the agents of the Universal have been soliciting to change from that company—proclaimed by the Superintendent of Insurance to be rather the better company of the two—to the Universal. No one knows better than the party issuing this circular how much the insured loses and the company gains by exchanging an old for a new policy. The privilege of importuning the members of another company to change policies is said to be worth, in some cases $600,000. Our advice is, "Should you be approached by the agent of another company with the view," etc., etc., kick him soundly.

A Sign of Weakness.—Whether it is because the Insurance Department of Massachusetts requires a higher reserve, or makes a more vigorous inquisition into the condition of a company's finances, would be hard to decide; but it happens to be a fact attested by numerous examples, that the first significantly bad step taken by a company about to fail is, to *step out* of that Commonwealth. Of the companies that have done so, either willingly or on compulsion, but two are in existence, and these are not permitted to do any new business. The list is a long but instructive one. Widows' and Orphans' Fund, Farmers' and Mechanics', Great Western, New York State, Empire Mutual, Delaware Mutual, Widows' and Orphans' Benefit, Hercules, Hahnemann, Craftsman, Commonwealth, Amicable, Anchor, Eclectic, Economical, Empire State, Excelsior, Government Security, Guardian, Hope, International, National Capital, National New York, North America, World and Asbury. There may have been companies withdrawing that are yet solvent, but the rule is so good that the act may be regarded as a premonition of uncomfortable sequences, and those who are interested in the solvency of a company declining to comply with the laws of Massachusetts are justified in regarding the refusal as being unpleasantly significant.

Longevity of Philadelphians.—The Philadelphia Ledger is responsible for the statement that 675 persons—254 men and 421 *women*—died in that city in 1875 at the age of 90 and beyond. Thirteen men died at the age of 90, eight at 91, two at 92, three at 93, four at 94, one at 95, three at 96, two at 97, one at 98, one at 99, two at 102, one at 103, and one at 108. The women did better still. Sixteen lived to be 90 only, eight held on till 91, seven died at 92, two at 93, six at 94, nine at 95, two at 96, four at 97, seven at 98, one at 99, three reached 101 each to 102 and 105. Nine persons reached the age of 100—a fact which strikingly confirms the mortality tables of the companies, which prophesy that one in every hundred thousand will attain that age.

The Asbury Life Insurance Company, that failed and passed into the hands of a receiver to be wound up, two years ago, has, according to law, a deposit of $100,000 with the State authorities for the security of its policy holders. An attempt was made recently to withdraw this deposit and place it in the Receiver's hands. Such a course would leave the policy holders almost utterly defenseless, and we hope that our legislators will remember the widows and orphans and promptly defeat any such measure.

Around the Republic.

"DOWN SOUTH."

Diary and Notes of an Ex-Editor Seeking Health.

BY CHARLES D. BRAGDON.

Jacksonville, Fla., Jan. 1, 1876.—I am not given very much to Centennial jubilation. We have far too much to be ashamed of and to correct, as a people and a Government, to warrant us in spending much time or money in self-glorification. While it is not well for any citizen to habitually depreciate his Government and the institutions of his country, it is equally unwise and unpatriotic to wilfully close his eyes and assume unconsciousness of faults and abuses which are glaring and repulsive to every well-ordered mind.

Hence, when this Centennial Year dawned this morning, my invocation was: "Perdition to political place-hunters and professional politicians, and Peace and Good Will to all patriotic lovers of their country who may labor this year to root out the radical evils which afflict the body politic."

The day is a hot one here. The colored people have been celebrating it with processions, music, speeches, dinners and balls—not simply as New Year's Day, but as Emancipation Day. It is their "Independence Day." Of the speeches I have heard none. But, judging by the demeanor of those who constitute the procession, there is a steady growth of self-respect and conscious manhood and dignity among the colored people. Some of our party have visited their schools here, and speak hopefully of them and of the evidence of proficiency among the pupils. Only a day or two since I saw a boy and girl—perhaps 8 or 9 years old—busily studying their lessons in the street, *en route* to school. It was a scene in remarkable and gratifying contrast with other scenes I remember witnessing in the South in 1856. If each State would make the ability to read and write an essential qualification in a voter, it would stimulate culture among the colored people, as nothing else will; for the right of suffrage is the highest prized privilege that has followed their emancipation.

Jan. 15.—The sunny days, with an atmosphere that makes us forget January, go by in monotonous procession. There is no "rush" here, as was expected. There has been no strain upon the capacity of the hotels, and few of the boarding-houses have their maximum number of boarders. Jacksonville is a city of boarding-houses. The municipal government derives an income therefrom, for it compels each one of them to pay a license. I am not able to state how many licensed boarding-houses there are here, but the city's income from this source must be of considerable importance.

A gentleman from Palatka and up the St. Johns, says there are very few visitors up there, and hotel men and boarding-house keepers do not lie awake nights to listen to the rustle of new greenbacks with which their pockets have been lined.

My good friend, "Kittatinny" WILLIAMS, evidently fearing from my first published notes that I did not know enough to "come in out of the wet," has been kindly proffering me the hospitalities of his up-the-river friends. "Why do you stay there in that low, wet basin?"

Since this is a conundrum that other people puzzle themselves about, and since there are good reasons why I stay here in preference to going into the higher altitudes, I may give them and allow those who may hereafter come hither with the same purposes I did, to consider them. I did not intend nor expect to stay in Jacksonville when I first came hither; but I stopped here that I might determine, from information to be obtained, where I would go. Without entering into a detail of the modes by which I got information, and the sources thereof (which, by the way, I regard sufficiently reliable as a basis of action) I came to the following conclusions:

1. That here I could secure more of the comforts necessary to an invalid and his family, and at less cost than in any other part of the State.

2. That just in proportion to the distance I traveled from Jacksonville into the interior, in just such proportion was the cost of living increased, and accessibility to supplies needed by an invalid diminished.

3. That life here in this city is quite depressing and monotonous enough for one accustomed to an active life; but that it would be still more depressing in the interior to one without the physical ability to hunt, fish, or improve land, etc. What would be a delight to even a semi-well man would injure one whose lack of strength caused him to chafe under restraint, and whose mental resources and philosophy would be too severely taxed by solitude for his physical good.

4. That the gain in healthfulness of location, softness and sweetness of atmosphere and general climatic effects would not equal the loss in most other respects.

I did not accept the testimony of physicians located here, though judging from what I have seen of them, not one of them would misrepresent in order to save Jacksonville from annihilation! Nor did I listen to real estate dealers located here, nor to citizens holding property for sale or otherwise. But I talked with men and women who had been in the interior as invalids and had returned hither. The unwisdom of a stranger, ill, with his family, and with resources that require economical care, "taking the chances" inland, was made apparent to me. All this would be different to a man with plenty of money to spend, who could take his supplies with him, or whose ill health did not deprive him of ability to make physical exertion a source of pleasure. Or it would be different in case a good home had been previously secured.

This seems altogether too personal for publication; yet I know, from the letters I have received, that it will answer many inquiries in the minds of RURAL readers—hence I send it without further apology. [See article entitled "Seeking Health in Florida," on next page.—EDS.]

The cost of living here in Jacksonville is not necessarily very much more than in Northern towns of the same size—if one keeps house. Furniture, carpets, etc., can be bought as cheaply here as there; also stoves and tin-ware. Crockery costs more. Most groceries are as cheap. Transportation hither from New York costs so little that a family can buy groceries of all sorts at wholesale in New York and save commissions. This is done by many families, and, with the active competition there is here, tends to keep down prices. Meats are generally poor. The "Tennessee beef," which is most in the market, is poor enough, but not so poor as the Florida product. "A nice roast" of this Tennessee beef costs 20c. ₱ lb. Good mutton (which is sometimes obtainable) costs the same as or more than beef. After the hotels and larger boarding-houses are supplied, it is difficult to get a good steak or roast. Fish are plenty, cheap, and some kinds are excellent. Oysters are plenty, cheap and very poor trash, though there is scarce a Floridan who does not boast of the excellence of Florida oysters! Excellent salt mackerel, codfish, etc., are found here at reasonable prices. Potatoes retail at $2 per bushel. More of the apples sent hither are Baldwins, and this climate rapidly changes them to the consistency and flavor of old saw-dust. Haven't found an apple fit to eat in the State. Oranges have been plenty at $2.40 to $3 per 100. They are generally very good, too—of good flavor and size.

There is a good deal of talk about this being a land of Bananas. I have seen little evidence of it in the market. They cost more here than in Fulton Market, New York. One does not see the steamers loaded down with them. Of course they grow here—that is, the plants do; but the frosts have cut them back this winter. Of course they are productive in other parts of the State.

Rents, during the winter months, and taxes the year round, are high. It is, I am inclined to think, cheaper to rent by the year than to own the property and pay the taxes. But I am told that the homestead, no matter whether it cost $100 or $100,000, is exempt from attachment or execution. The Floridan's home is his castle indeed, so far as any rapacious creditors are concerned; and I have been given to understand that there is no limit to the amount of money one invests in a homestead.—it is safe from the Sheriff, except in case of special agreement.

Jan. 24.—The weather continues remarkably warm for even a Florida winter. No,—in answer to a letter just received—let no Northern stock-grower come down here with a herd, hoping to make money by breeding and growing stock here. There may be some people in this State who will dare to assert that it can be made profitable, but I have not yet reached that enthusiastic conviction. Milk retails, from the milk-wagons, at 20 cents per quart, or 6 quarts for $1; and we find that cream will rise on it if allowed to stand over night. But I imagine the bulk of the food upon which these cows are kept, comes from New York or some other Northern port. I have seen a few patches of Bermuda grass here, and there are coarse, wiry grasses on some of the creek edges; but grass is the feature wanting, and that cannot be produced on these sandy soils with the long drouths incident to this climate.

No, the men who may hope to be best contented, and desire profit from their previous experience and labor here, are Northern horticulturists—men with fruit-growing proclivities and truck-gardening experience. I see no beckoning for the ordinary farmer who has pursued a mixed husbandry North. I don't mean to say that mixed farming may not be successfully prosecuted here; but I do say that the man who is succeeding by it North had better stay there.

Diary of a Ruralist.

DAILY RURAL LIFE.

From the Diary of a Gentleman near New York City.

FOOD AND SHELTER FOR BIRDS.

Jan. 29.—Thus far the winter has been so mild that the birds, which usually frequent my grounds this season, have scarcely paid me a "flying visit." Generally the evergreens about the grounds are a great resort for my feathered friends, and every morning they come about the barn and house and ask for a breakfast of seeds and crumbs of bread, a request which is never passed unheeded. But the present winter we have missed all this pleasure of feeding the birds, and I could almost wish for one good snow storm just to bring back the wanderers, who are doubtless scattered through the forests or chirping about the farmhouses in some more northern region.

We have thus far escaped the snow storms common at this season, and doubtless the birds join me in feeling that there is no cause for regrets over so favorable a change in the weather; still it seems rather unkind of them to act so "human" as not to give me a call without the promptings of selfish motives. Jonx has great heaps of hay and weed seeds, awaiting the order of the snow birds, and Mrs. RURALIST says that at least one loaf of bread has been saved from each baking this winter through the absence of the birds, still she misses the pleasure derived from feeding them.

Of course we shall forgive our little friends for this neglect, and give them a cordial welcome whenever they do come this way again: and further, would urge the planting of evergreens about the home grounds to afford shelter to the birds in winter. In addition to trees and shrubs for shelter, there are many kinds which produce fruit very acceptable to birds, although of no especial value to man, and these should not be overlooked in laying out and planting new grounds or improving old ones. The sassafras produces a fruit greedily eaten by several of our larger kinds of birds. A closely allied species known as the spice or fever bush, found in all our Northern swamps, bears brilliant scarlet berries, which are not only ornamental but much sought for by birds. The Highland cranberry is another handsome, ornamental shrub, bearing a profusion of light, crimson-colored fruit, ripening very late in autumn. In fact all of our many native species of *Viburnums* produce edible fruit much relished by birds. The Buffalo berry, (*Shepherdia*) Silver Thorn (*Elæagnus*) and scores of other native shrubs might well be introduced into our gardens, if for no other purpose than to supply the birds with food. We have driven away the birds, our natural protectors from insect enemies, by destroying the trees and shrubs, among which they found a safe retreat as well as food for sustaining life. In addition to this we allow every "scalawag," whose highest ambition is to burn powder and kill something, to prowl over our fields and destroy the harmless birds.

In the face of all this interference with natural laws, our fruit growers and farmers ask what shall be done to save the products of their fields from insect depredations? Alas! wisdom *is* a slow coach, carrying few passengers at a time.

THE EUROPEAN CHESTNUTS.

Jan. 31.—There are many localities where the European varieties of the Chestnut will succeed quite well in this country, but their only merit is large size. In quality none of them compare favorably with those of our own native sorts; therefore I do not see why we should pay much attention to their cultivation. We also have varieties nearly as large as the most famous foreign sorts, and by experimenting a little we may be soon able to produce new ones even larger than those brought to us from across the Atlantic. All that is required is to pick out the largest and best of those found growing wild in various parts of the country, and from those raise seedlings.

Of late I have noticed that the cultivation of the foreign varieties of the Chestnut is being discussed quite freely in some of our agricultural journals, and while I admit the probability of success, still I believe that in the long run our native sorts will give the best and most profitable results. In my own experience I have found the European sorts less hardy than the American, and far more liable to diseases caused by cold in winter or sun-burn in summer. Many thousands of the foreign trees have been imported by our nurserymen during the past half century, but the number which has survived and reached a bearing size is very small indeed. Occasionally one finds trees which have grown thriftily and escaped disease, but these are exceptions to the general rule.

Probably the best method of securing a healthy orchard or grove of the foreign varieties would be to graft them upon native stocks, inserting the cions near the roots, and then keep the heads low in order to shade the stems. I have found that some of the stronger-growing foreign varieties overgrow the native stock, or in other words increase more rapidly in diameter, but less in length; consequently, when the cion is inserted upon tall stocks it makes a rather unsightly top-heavy tree. When forestry has been as thoroughly studied and written up in this country as in Europe, it will be found that we have an abundance of really distinct and valuable varieties of the chestnut.

Our nurserymen have not as yet done much towards disseminating choice varieties of our native nut trees, but they must soon see the necessity of taking hold of this long-neglected branch of horticulture. I am reminded of this almost general neglect of propagating nut-bearing trees by the receipt of a quart or more of

HALE'S PAPER-SHELL HICKORY NUT,

Which was figured and described in the RURAL NEW-YORKER of Nov. 19, 1870. This is one of the best, if not the very best variety, of our common shell bark hickory I have ever seen, and fully warrants the description given of it in the RURAL five years ago. I understand that it is now being propagated in one of our leading nurseries, and will be offered for sale as soon as a sufficient stock of trees is produced. There are doubtless other varieties to be found worthy of propagation and dissemination, but somebody must look them up and make their merits known.

The Pecan nut, which is only a species of hickory, is quite variable, and I have received specimens from the South that were very large and quite distinct from those generally seen in our markets. These choice native sorts must be looked after, for those who are able to own fine orchards and ornamental grounds want the very best of everything, even to hickory, pecan and chestnuts.

The Swine-Herd.

ORIGIN OF HOG CHOLERA.

A WRITER in the Patrons' Helper of Iowa, traces the cause of hog cholera to close confinement and especially to the practice of ringing pigs to prevent them from rooting the soil. His argument is certainly plausible and the theory interesting. We quote:

Let us watch our hogs in their ample pasture. Some are browsing the herbage, some are destroying it by extracting the roots. Others are—what are they doing? They are rooting into that woody hill-side; into that hard, calcareous soil. The crackling sound indicates that they are eating the clay with its limestone pebbles. What can this be for? Well, we cannot tell. We know it as a fact. It may effect something chemically; but we sometimes doubt that, it being too crude to enter into the animal economy. Perhaps its effect is mainly mechanical.

The poor pig has no rights that man or dog is bound to respect, outside of his pen, so it is furnished a pen; may be one or two acres; frequently much less. In Mrs. Piggy goes with her numerous progeny. Everything goes well for a while. They eat the grass and turn over the soil and thrive. The owner improves his herd by an infusion of Chester White, Poland China or Berkshire blood. He is well satisfied with the profits of the investments.

Anon! a change has come in the condition of things. The surface soil is now all rooted over. The desirable properties are exhausted or befouled with droppings. The pigs endeavor to dig deeper but the filthy mass falls to the bottom; and soon it is said the pigs are not doing well.

The owner changes their food, gives them sulphur and antimony and what not. He concludes they look a little better, but they don't do well yet. In fact, he sighs for the "good old Elm Peelers and Prairie rooters." It does not stop here. The pigs are constipated, dyspeptic and mangy. Their blood is out of order, and ulcers are found on some so as to cause portions of the flesh to slough off. In fact they have got the cholera. No wonder. Had the proprietor made a vegetable garden or a corn field of his hog lot a year or two ago, and furnished his hogs with another pasture, his improved hogs would have improved the strength and vigor of his herd, and also the condition of his finances.

BLACK TOOTH IN SWINE.

THE American Swine Journal says:—Black tooth, so called, in swine, is sometimes caused by mechanical injury to teeth, received by chewing the dry and hard kernels of corn. The ailment consists in a state of decay of the tooth (caries). Such decayed teeth may be removed by the same instrument as a dentist would apply to one's own tooth under similar circumstances. The symptoms of toothache in swine are similar to those exhibited by mankind, viz: loss of appetite, salivation or slobbering, hanging the head, mostly to the side which is affected, peevishness, loss of all fear of man, and hot, repulsive breath. When hogs are fed on strongly acidulated food for any length of time, their teeth may become discolored; but it is a question whether the teeth at the same time are materially injured. So long as no decay or diminution of their substance can be noticed, and while the appetite and chewing facilities of the animal do not appear diminished no interference will be necessary.

Domestic Economy.

AN APOSTLE OF THE KITCHEN.

A WRITER in the Galaxy tells (we regret to say) an o'er true tale in the subjoined brace of paragraphs:

A few years ago the worthy Prof. Blot endeavored to create good housewives, but the hour and the man did not come together, for when he strove to turn woman's thought kitchenward their ears were deaf. His effort was made in the era of financial plethora when the idea of women was in spending money instead of saving it, and his wise counsels were unheeded. The forerunner of the hygienic and economical cuisine held aloft a loaf of wholesome bread, saying it was the foundation of human happiness; the women tittered, and yet it was true. With the enthusiasm of a reformer he offered to teach women how to turn dyspeptic stomachs into healthy ones, and consequently miserable husbands and fathers into members of a happp family. Again the women tittered, and continued to titter, until the apostle of the kitchen, finding that his glad tidings fell on ears that did not understand, became discouraged and withdrew into obscurity, whither a few of the faithful followed him, but even these abandoned him after a time, and then he died.

The Professor came in the spirit of a missionary possessed of a scheme of propagandism. The symbols of his office were soup and bread, for they were the principal auxiliaries by which the gastronic tenets were to spread. He proposed to make of a restless, eager, unsatisfied people a peaceful and blest one—to establish economical habits in the household, consequently to change thriftless, idle, extravagant women into good wives and mothers. It was nothing less than a revolution which the Frenchman contemplated. Some who comprehended the scope of his mission listened to him, but with apathy. The greater part smiled when the propagandist of wholesome nourishment unfolded his scheme, accompanied with Gallic zeal, gesture, and accent. The thing itself and its exponent appeared to be ludicrous. So he preached and taught in vain.

CHINESE COOKING.

AMERICANS who dine with the Chinese are surprised at the perfection to which they have carried their cooking. During a recent Chinese banquet at San Francisco, an orange was laid at the plate of each guest. The orange itself seemed like any other orange, but on being cut was found to contain within the rind five kinds of delicate jellies. One was at first puzzled to explain how the jellies got in, and, giving up that train of reflection, was in a worse quandary to know how the pulpy part of the orange got out. Colored eggs were also served, in the inside of which were found nuts, jellies, meats and confectionary. When one of the Americans present asked the interpreter to explain this legerdemain of cookery, he expanded his mouth in a hearty laugh and shook his head and said:—"'Melican man heap smart; why he not findee out?"

SELECTED RECIPES.

Baked Squash.—Take a squash, cut in two, clean inside, put in the oven flesh side up, an hour before dinner. Serve hot, with butter, pepper and salt. Squashes not quite ripe are also good thus baked.

Rye and Indian Drop Cake.—One pint of Indian meal, one-half pint of rye meal, two spoonfuls of molasses, a little salt; work it with cold milk so as to drop from a spoon into hot fat; be sure to have a smooth batter.

Meat Loaf.—Chop fine whatever cold meat you may have, fat and lean together, add pepper, salt and finely-chopped onion, two slices of bread which have been soaked in milk, and one egg; mix well together and bake in form. This makes an admirable tea or breakfast dish.

Pop-Overs.—Four eggs, four cups of fine graham flour, four cups of milk, or simply good milk and the best white flour made into a rather soft batter. These may be baked in gem tins or gem irons, or small cups which should be previously heated. Bake in a hot oven and eat with fruit sauce.

Doughnuts Without Eggs.—One-half cup of buttermilk or sour milk, the same of cream and of sugar, one teaspoonful of saleratus, spice and salt to taste; add a little yeast, flour enough to mold, and let it rise before frying; or if an egg can be put in, the yeast can be left out and the dough fried at once.

Stuffed Cabbage.—Take a large fresh cabbage and cut out the heart; fill the place with a stuffing made of cooked chicken or veal, chopped very fine and seasoned and rolled into balls with yolk of an egg. Then tie the cabbage firmly together and boil in a covered kettle for two hours. This makes a delicious dish, and is useful for using small pieces of cold meat.

Mincemeat Fritters.—With half a pound of mincemeat mix two ounces of fine bread crumbs (or a tablespoonful of flour) two eggs well beaten, and the strained juice of half a small lemon. Mix these well and drop the fritters with a desert spoon into plenty of pure lard; fry them from seven to eight minutes, drain them in a napkin and send them very hot to the table. They should be quite small.

Hygienic Information.

SEEKING HEALTH IN FLORIDA.

WHERE AND HOW INVALIDS MAY LIVE COMFORTABLY.

TWIN LAKES, near Mellonville, Orange Co., Fla., January 11, 1876.

EDS. RURAL NEW-YORKER:—I notice in your issue of Jan. 1st a letter dated Jacksonville, Fla., Nov. 26, giving a description of the damp weather prevailing at that date. For fear that many of your invalid readers were discouraged by that letter, I write to tell you my side of the story—being up the St. Johns at the same time. I reached Jacksonville on the 26th of Nov., from Penn.; but knowing its character for dampness from many of my acquaintances, pressed right on to Palatka, where I kept my bed for five days before feeling strong enough to go on to our destination. At Palatka it was damp and chilly, but nothing like what your correspondent describes. A fire was not only comfortable, but necessary; but our clothing was not damp in the morning nor did we notice mold on our shoes. Truth compels me to say it was disagreeable enough, and confirmed me in my opinion of that part of the State not being the right place for invalids. When we got up here we still found the damp prevailing, but so much milder and more pleasant that we did not think of a fire and rode in an open vehicle five miles, without taking cold or being very much fatigued. Two miles back from the river the land commences to rise and break into little knolls and hills, with here and there a lake varying in size from a pond to large sheets of water several miles in length. A more desirable spot for homes cannot well be found than on the slopes and hights overlooking these lakes. The soil is pure sand and the timber pine, but all the better for that. The little rain there is runs off so quickly, there is no trace of dampness, and the air is full of resin from the trees. Such air—so pure that our fresh beef dries up if left hanging too long—and one can go all day without being sensible of fatigue. Every inspiration is a pleasure to the tender throat and delicate lungs. When we left home every breath seemed to rasp and hurt, and now it is all gone, and with it the sense of weariness and langour. The air seems to have as much effect on the nervous system as any thing else, soothing and restoring in a wonderful manner. This is our experience and that of many others.

The right way for people to come here, is to bring some bedding and indispensable housekeeping things along in their trunks; buy or rent a cooking stove; rent a cabin or more pretentious frame house and get a carpenter to make them some rude bedsteads, table, etc. etc., and keep house in primitive style. There are in this neighborhood houses to rent at from five to ten dollars per month; in which a small family can be made very comfortable, if choosing to live in such way for several months. We were fortunate enough to find a small house of three rooms, furnished, and are keeping house without the help of any one except a washerwoman. There are no negroes in these lower counties, and no servants, except those brought along. But this is not the objection one might think, for the simple reason that house keeping in such a style is not hard work; it is play compared to our methods at home, and if one wishes to economize—that's the secret—do things yourself. There are many, many invalids whose friends would bring them here if it were not for the cost, and when you pay boarding it soon runs away with money; but in this way you are perfectly independent, and live far more comfortably and at very little expense. I hope none of your readers who want health will stop at Jacksonville, but come up here to the hills where there is no damp. Don't stop at the river, but get back into the country. Health is every thing, and to gain it we must put up with many things not so indispensable as we may have supposed. MRS. M. C. B.

REMARKS.—By reference to the last letter of our Jacksonville correspondent, on page 106, it will be seen that Bro. BRAGDON has some cogent reasons for remaining in or near that place. Still we are inclined to think Mrs. M. C. B. correct in seeking a hilly region, in the interior, where fogs and dampness do not prevail to an injurious extent.—[EDS.

REMEDY FOR DYSPEPSIA.

A WRITER in the Medical Journal, discoursing on dyspepsia says:—We have seen dyspeptics who suffered untold torments with almost every kind of food. Bread became a burning acid. Meat and milk were solid and liquid fires. We have seen these same sufferers trying to avoid food and drink, and even going to the enema spring for sustenance. And we have seen the torments pass away and their hunger relieved by living upon the white of eggs, which have been boiled in bubbling water for thirty minutes. At the end of a week, we have given the half yelk of the egg with the white, and upon this diet alone, without fluid of any kind, we have seen them begin to gain flesh and strength, and refreshing sleep.

After weeks of this treatment they have been able, with care, to begin upon other food; and all this the writer adds, without taking medicine. He says that hard boiled eggs are not half so bad as half boiled ones, and ten times as easy to digest as raw eggs, even in egg-nog.

TEA A POISON.

THE Journal of Chemistry asserts that tea is not the simple, harmless beverage that it is generally supposed; but that its effects, in their character, may rightly claim to be classed with those of tobacco and alcohol. The Journal of Chemistry adds:—"Many disorders of the nervous system are the direct result of extensive tea-bibbing. Tea is a 'narcotic poison:' its essential principle, theine, is allied in composition and properties, with strychnine and morphine. It first excites the nervous system and then exhausts it. Experiments show that, both in man and in other animals, it impairs power in the lower extremities; so that it affects the 'understanding' in a double sense—literally as well as figuratively. It is not the harmless exhilarant it has been considered, but a powerful agent, whose effects are often serious."

REMEDY FOR DIPHTHERIA.—A correspondent of the Boston Journal writes that he has used the following remedy for diphtheria in a great many hard cases, and in not one has it failed to effect a cure. It is as follows:—Procure some pitch tar—not gas tar—put a little on a hot iron, invert tunnel over the smoke, and let the patient inhale as much as he can without strangling, for a few minutes, five or six times a day. During the intervals let the patient have small pieces of ice to keep as near the root of the tongue as possible.

Sheep Husbandry.

WOOL GROWING IN NEBRASKA.

MR. HARRISON G. OTIS of the U. S. Patent Office, and JAMES A. LAWRENCE of Overton, Dawson Co., Nebraska., recently addressed a letter to MOSES STOCKING of Wahoo, Saunders Co., Nebraska, asking information concerning the business of Wool Growing and Sheep Husbandry in that State. Mr. STOCKING made a reply, the substance of which we copy as follows:

With such a vast area of country admirably adapted to wool growing, it is a disgrace to us, as a nation, that we are still importing 50,000,000 pounds of raw wools per annum, and an amount equally large in the various forms of woolen manufactures.

The Western people have prosecuted grain growing, at a loss, with a vigor and a pertinacity worthy of a better cause, and almost overlooked one of the most pleasing and profitable of rural employments—that of sheep husbandry—for which their soil, climate and abundant grasses are so admirably adapted. Clear these noble plains of hostile Indians, preserve our present wool tariff intact, and with such industrious and far-seeing men as yourself, and some other worthy souls who could be named, to arouse attention and point out the way, and in ten years these United States would produce a large surplus of wool for export. Twenty years have sufficed to raise California, Australia, Van Dieman's Land, South Africa and the Argentine Republic from nothing to the position of leading wool-producing countries of the globe.

The success of our California brethren is but an earnest of what may be done in other portions of our country when the genius and enterprise of our own people shall take hold of the business in earnest. In the State of Georgia, notwithstanding the low breed kept and the immense annual loss from worthless dogs, sheep husbandry pays a profit of 63 per cent. per annum on the capital invested. The business will pay a profit equally large throughout three-fourths of the area of these United States. Let the country understand that the present wool tariff shall be maintained, encourage all classes of useful manufactures, turn the Indian over to the Army and compel him to labor for his living, kill off the worthless dogs, and, my word for it, in a few years these States will lead the world in the amount and value of their wool product.

But I have wandered far from the business before me and must get back to your questions: "What breed or grade of owe sheep would be best for him there for breeding purposes?" To answer this question definitely a knowledge of his acquaintance with the business and the principles of breeding is requisite. Pure-bred sheep of any breed are not very plentiful, and are always high in price; consequently, a considerable capital will reach but a little way, and, unless he has had much experience, or has a genius for breeding, he will be likely to fail, for a time at least, if he should attempt them.

I claim that our American Merinos are the best sheep in the world for our Western prairies at the present, and that they must continue such for years to come, and until civilization shall open up a largely-increased market for mutton, and the native grasses are supplanted by more succulent and perennial varieties. Until all this is accomplished the Merino and its crosses must remain as the sheep for the West.

Presuming that Mr. LAWRENCE has but a limited knowledge of sheep, I would recommend him to purchase, in the main, sheep of high grade, such as may be found in Ohio, Michigan, Wisconsin, Illinois, Iowa and Missouri, and which are abundant and cheap. Michigan is almost exclusively stocked with a class of sheep three-fourths to full-blood Marino, which are well adapted to these prairies, and which will, under fair care and feed, pay a very large per cent. on the cost annually. For the two-fold purpose of improving the blood of his flock and mastering the art of breeding, let him get in addition a few pure-bred pedigreed Merino ewes and the necessary number of pure-bred Merino rams for the whole flock. In this natural sheep country and healthy climate, it is not necessary to obtain acclimated animals. All sheep do well here, without regard to the locality which they came from, unless diseased when they arrive, and even then, under good care, soon come out all right.

2. To your second interrogatory I would answer that the chances to purchase desirable sheep here are exceedingly limited. This is a natural grass, grain and stock country. Our people have grown wheat to sell on the market until they are most heartily sick of that business. There is now a general awakening to the fact that in future some other business must be pursued, and stock raising in all its branches, and particularly wool growing, is attracting much attention; and as there are but few sheep (some 40,000) in the State, these are tenaciously held to.

Last June, in the localities named above, fair grade Merinos were held at about $1.50; high grades at about $2 per head. They are now much higher. But next season, soon after shearing, the prices no doubt will be about the same—prospectively a little higher. Rams—superior rams—can be obtained in Western New York, Western Pennsylvania, West Virginia, Ohio, Michigan, Southern Wisconsin, Illinois, Iowa and Missouri. [Here follow the names of well-known breeders in each of the States named.]

3. * * * The common coarse-wooled ewe of the West and the Mexican ewe are now held at figures about equal to the prices of high-grade Merino ewes, which will shear twice as many pounds of wool, and are much less troublesome to handle than the common native. The Mexican ewe possesses this advantage over the Merino ewe, that it is a more prolific breeder, but this point is fully balanced by the enhanced value of the Merino fleece. Again, they require less food and less shed room than any other good breed with which we are acquainted; their fleece being more dense (when not too greasy) enables them to endure stronger winds and a greater degree of cold. Besides, the wool fiber does not catch and waste on rough herbage like that of the more coarse and open fleeces; neither are they so liable to contract diseases, when run in large flocks, as are most other breeds, which, to the Western flock-master, is a very strong point.

The high price paid for coarse wools in our country, during the past few years, together with the increasing demand for mutton, has a tendency to cause novices to overlook the many valuable points of the Merino and induce them to engage in the breeding of those coarser breeds, without any regard to their adaptability to the locality and the breeding surroundings. To all such I would say, beware! First look over the whole ground, study the situation closely, nicely adjust the advantages and disadvantages, then purchase the breed best adapted to the locality, *and stick to that breed.*

Fashion is a fickle goddess, and the flock-master cannot change his flock to follow her vagaries with the facility that the postmaster did his political jacket, who, when asked how he had managed to keep his place through so many administrations, answered, "The easiest thing in the world, sir! All you have to do is to change in time, sir—and I defy any administration to change quicker than I can!" * * * * *

I remain, Sir, sincerely yours,
MOSES STOCKING.

"PROGRESS AND IMPROVEMENT."

SATURDAY, FEBRUARY 12, 1876.

BENEFITS OF THE OPEN WINTER.

While the mild weather of the first two months of winter has proved detrimental to people of a few occupations in limited regions, the great mass, in both country and city, have derived great advantage and benefit from the absence of frost and snow. The interests of the rural population seem to have been especially promoted by the open winter, in almost every part of the country—the farmers of the West and South, as well as those of the North and East, having taken advantage of the genial weather to perform much spring work in advance. For example, an old Kansas subscriber to the Rural—Mr. B. M. House, now a resident of Newton, Kansas—writes under date of Jan. 24 as follows:

"The last season was one of unprecedented prosperity for the farmers of this part of Kansas, they having been successful in every branch of agricultural industry. Our farmers have taken advantage of the beautiful weather we have been having this winter and prepared their lands for the reception of crops in the spring, not having been interrupted by frosts or snow. Many people are breaking the prairies, on which they will sow oats in the spring. It was formerly the practice here to break prairie only through the months of May and June, it being supposed that when broken at any other time of year it would not rot,—but within the last year or two it has been demonstrated by actual experiment that prairie broken in the winter and sown with oats in the spring will rot equally well with that done in May or June. There are large quantities of breaking being done here this winter, and the ground will be sown to oats in the spring and the crop taken off in season for wheat next fall, thus affording the farmers the benefit of two crops where only one was formerly secured. It has been demonstrated beyond the possibility of successful contradiction that the lands lying contiguous to the A. T. and S. F. RR., which is in the beautiful Valley of the Arkansas, are the richest and most productive of any in the State, and the liberal offers made by that Company have induced an emigration to this part of the State which will very soon bring every acre of land under cultivation."

From various parts of the Middle and Eastern States we have favorable reports from farmers, horticulturists and gardeners who have been enabled to take advantage of the "ethereal mildness" by working in field, orchard and garden. Even in the South the winter has been so unusual that much unseasonable labor has been performed most advantageously. A Farmer writing from Monroe Co., Ga., Jan. 26, to a contemporary, says:

"The prevailing topic of conversation is the 'hard times;' but instead of lessening the energies of the farmer, most of them have started work with redoubled vigor, to recover the loss sustained by the disastrous drouth of last summer. The winter has been unusually warm. The crop of wheat and oats never looked finer at this season. In fact, it was put in with uncommon care, and so much cotton seed was applied as manure that some planters will need it at planting time to raise another crop of cotton. As to oats, every available piece of land is still being sown. And you need not wonder at plows running now, when the plum trees are in full bloom, and we are trembling for other fruit, as all kinds of trees are just ready to bud. While some residents are seeking new homes in Texas and the West, persons from all parts of the world are inspecting our land."

Unless the cold weather which many predict will prevail this month (and which opened here on the 3d, giving us the first sleighing of the season,) proves very severe, the prospect is that the Centennial Year will be one of unusual vegetable production and consequent prosperity to all engaged in rural pursuits.

RURAL NOTES AND QUERIES.

Diversified farming for the South.—The Granges of the Southern States are moving quite generally to decrease the production of cotton the coming year. So far as this means the creation of new industries it is a good movement. The South needs a more diversified industry as the first step towards prosperity. Undoubtedly the attention of planters has been directed too exclusively to cotton growing, and, as a result, the price is below a fair paying rate. But we notice that the antithesis to cotton is almost always corn—if a planter concludes to grow less cotton he fills up the gap in production with corn, rarely thinking of anything else. There is just as likely to be a glut of corn as of cotton. In the West farmers almost always have a glut of corn, and the price there is usually too low for profit. Let the Southern planter, besides corn, grow other grains, sheep, cattle, horses, vegetables and fruits of all kinds suited to the climate. In this way they will become really prosperous and independent, as they cannot hope to be on two crops more than upon one. Corn, indeed, is the poorest crop to grow in connection with cotton, as the labor of cultivating and harvesting of both comes at the same season of the year. What is needed is an industry which shall furnish employment in seasons when, under the present system, there is nothing to be done. This ought to be more easy in the South than in our more rigorous Northern climate; but it seems never to have been done. Hence the general lack of prosperity of Southern planters.

The Battery Endangered.—"The march of improvement" in New York City is up town. The lower part of the city, or what constituted the whole of New York of 100 years ago, (and a good deal less) is comparatively neglected, and its rural features, especially, seem to be little cared for. The old park has been filled with fine buildings, notably the new Post-Office, which is the finest and most imposing structure in the city. Now it is proposed to occupy portions of the Battery Park with buildings of the Elevated Railway Companies, and thus do away with that breathing place for thousands to whom even Central Park is not easily attainable. Against this we protest. The rural features of New York (including the Rural New-Yorker) are among its best and most important features. What parks remain should be made the most of. The Battery, especially, affords an outlook on the Bay which makes it a more pleasant summer resort than any other park not giving the cool salt-water breezes and view could be. As the trees recently planted attain age and size the Battery Park will become more attractive, and be more and more regarded as a necessity. Spare the old Battery!

A Great Wheat-Growing Region—Is Eastern Washington Territory, according to an informant of the Portland Oregonian. In testimony whereof these figures are given:—C. Maier, near the base of the Blue Mountains, in Walla Walla Valley, in 1873 raised on a sixty-acre field 4,020 bushels of wheat—an average of 67 bushels to the acre; and in 1875, from a sixty-acre tract, 3,420 bushels, or 57 bushels to the acre. Mr. Masterson, four miles south of Walla Walla, raised on ten acres 850 bushels, or 85 bushels to the acre. Mr. Kennedy, whose farm is on Dry Creek, six miles from Walla Walla, harvested 5,252 bushels from 150 acres—35 bushels average; and this was a volunteer crop—that is, the second crop from one sowing. It is added that these crops were produced on ordinary wheat land—land that is "no better than hundreds of thousands of acres now lying vacant in Walla Walla and Whitman Counties, especially north of Snake River, where there is a country vast enough to produce more than 25,000,000 bushels per annum, and where a failure of crops has never been known."

Restricting the Debt-Making Power.—Locking the door after the horse is stolen has passed into a proverb for untimely reform but here is a proposition not altogether too late. Two members of the N. Y. Legislature—Senator L. B. Prince of Long Island and Senator W. N. Emerson of the Monroe District—have attempted something like this in measures designed to prevent further increase in city and municipal indebtedness. Senator Prince proposes to restrict the debt of New York City to ten per cent. of its taxable property. Senator Emerson proposes a Constitutional Amendment, prohibiting all localities from incurring a debt greater than four per cent. of the assessed valuation. This would, in many localities, compel the severest economy in local government, and prevent the waste of a great deal of money. It would also have an excellent effect on the credit of State and local governments, and, by restricting the addition to bonds, make a much better demand for those already in existence.

Willard's Practical Dairy Husbandry.—This work, published at the Rural Office, is thus noticed in the last number of the New England Homestead:

"The author has been long known, both in this country and England as an authority on all matters connected with the Dairy. In this volume he has given the results of his experience and observation, and has made a truly standard work on practical Dairy Husbandry. It is decidedly the best book of the kind which has ever been issued. It is complete and accurate, nicely printed and finely illustrated. The chapters on the Management of Grass Land, Dairy Farms and Fixtures, and Dairy Stock are very valuable. It is a first-rate book and should be in the hands of every farmer in the country."

Fast Mails in 1776.—One hundred years ago the phrase "fast mail" did not mean all that it does now. The following paragraph from the Pennsylvania Gazette of February, 1775, shows what was thought a decided progress for those times:

General Post-Office,
Philadelphia, Feb. 14, 1775.

It having been found very inconvenient to persons concerned in trade that the mail from Philadelphia to New England sets out but once a fortnight during the winter season, this is to give notice that the New England mail will henceforth go once a week the year round—where a correspondence may be carried on and answers obtained to letters between Philadelphia and Boston in three weeks, which used in the winter to require six weeks. By command of the Postmaster-General. Wm. Franklin, Comptroller.

Salt for Cattle in Winter.—Farmers often neglect to salt their cattle in winter. The old practice of salting hay in the mow has been discarded, and we think justly, because it more frequently injures than preserves the hay. But this usually results in supplying the animals with no salt during the winter months. It is pleasant also in summer to visit the herds in green pastures and throw the salt in lumps on the velvet turf, while in going into a dirty barnyard in winter there is no enchantment whatever. Salt should be given to cows in the stable or some other dry place, and on no account in contact with snow, for snow and ice in contact with salt create an intense cold, which is injurious to animals.

The Scientific Farmer.—This valuable paper, filling a place in agricultural literature which no other journal can supply, has been removed to Boston, Mass., and will hereafter be conducted under the editorial management of Dr. E. L. Sturtevant and E. H. Libby. These gentlemen are well qualified for their positions, and the Scientific Farmer, in their hands, must continue to be an important medium for combining scientific research with the conclusions of practical farmers. The paper is issued monthly, in good style, at $1 per year.

Premiums for Corn.—We learn that the premiums for corn announced by Mr. Conrad Wilson two weeks ago are to be materially increased and new features added. The matter will also be taken in charge by the Centennial Commission, and the premium corn can be exhibited at the International Exposition in Philadelphia. Corn is the great American cereal, the amount, both in bushels and value, being much greater than that of any other grain, and it is, therefore, decidedly appropriate that corn should figure conspicuously at the American Centennial Exhibition.

Maine Poultry Show.—The Maine Poultry Association held a very successful show (its third annual) at Portland during the week ending Jan. 29. The first year there were about 400 entries, last year about 800, and this year 1,000. The quality of the exhibition was superior, showing great improvement in the stock. The attendance was large, some 25,000 persons having visited the show. The stock on exhibition was estimated at $60,000; the pigeons alone were valued at $10,000, four pairs of which, from New York, cost $900. A good crow for the sunrise State.

A Natural Mistake.—As a result of the ridiculous fuss which the English people always make over any of their royal family, the poor heathen of India with whom the Prince of Wales is now visiting, imagine that the Prince is the Englishman's God—or at least one of them. The mistake is not unnatural for heathen accustomed to worship at the shrine of Juggernaut.

Dreer's Garden Calendar.—This little manual for the Centennial year, published by Henry A. Dreer, No. 714 Chestnut St., Philadelphia, is on our table. It contains a full list of requisites for the flower and vegetable garden, with much valuable information to all interested in any branch of horticulture.

CENTENNIAL ITEMS.

Reverdy Johnson has prepared a written opinion, affirming the constitutionality of the Centennial appropriation.

Baron de Sant' Anna, the Portuguese Minister at Washington, has been nominated to be Centennial Commissioner for Portugal.

Flood & O'Brien are going to have one month's yield of the Consolidated Virginia and California mines exhibited at the Centennial Exposition. It is expected that $10,000,000 will be the figure, and in 3,500 silver bricks weighing 150 tons.

The Japanese Commissioners to the Centennial—Messrs. G. Kunst, M. Shieda, T. Yamaon, H. Shibata, and U. Tawara—arrived at San Francisco, Jan. 31, and will soon come East.

An effort is making to form a Georgia brigade for the Centennial, to be commanded by Gen. J. E. Johnston, and composed of battalions from Augusta, Macon, Savannah, and Atlanta.

May 10th is the day on which the great Centennial Exposition opens at Philadelphia. Those proposing to make entries should understand that there can be no more delay in the matter.

A long list of topics for Centennial sermons, has been prepared jointly by the Centennial Committee of the Brooklyn Baptist Social Union and the Central Centennial Committee of the State of New York.

O. R. Ingersoll of Knickerbocker Grange No. 154 of New York City has been invited by Bro. S. W. Lawrence, Sec'y State Grange of North Carolina, to deliver his celebrated oration on the Centennial Encampment before the State Grange of N. C., Feb. 15th.

Advertising in the Catalogue of the Centennial Exhibition is in charge of Messrs. S. M. Pettengill & Co. of New York, Phila. and Boston, the oldest and most experienced advertising house in America, and one widely noted for its responsibility and integrity. They have an agent in Europe who is procuring advertisements for the Catalogue and prominent American newspapers.

RURAL BREVITIES.

A dandelion in full bloom was picked in Medina, Ohio, in January.

The date of the next Ohio State Fair is fixed for Sept. 4, 1876, and the five days following.

The Annual Fair of the Western N. Y. Ag. Soc. will be held on the Driving Park Grounds, Rochester, Aug. 29 to Sept. 2, inclusive.

The export of grain and flour from New York for the last week in January, was: flour, 44,386 barrels; wheat, 442,826 bushels; corn, 332,326 bushels.

Indianapolis grunts with satisfaction because the number of hogs packed there this season up to date has been 258,364, an increase over last year of 11,027.

The famous racehorse Gladiateur, which won the Derby, the St. Leger, the Two Thousand Guineas Stakes, and the Grand Prize of Paris in 1865, recently died in England.

Minnesota's principal crops—grain, grass and potatoes—which were valued at $2,740,000 in 1860, aggregated $36,600,000 last year. This shows remarkable growth and progress.

One singular fact about wheat is, that the foreign markets have 30 per cent. less wheat than at this time last year, and the increase in price over last year is but four per cent.

The Mich. State Pomological Society will hold its next meeting at Lansing, Feb. 16—17, when the affairs of the Society and its programme for the year will be considered and settled.

E. & J. C. Williams of Chestnut Hill Small Fruit Nursery, Montclair, N. J., send us their descriptive catalogue of Fruit and Ornamental Trees, Grape Vines and Small Fruits for the Spring of 1876.

Wm. G. Wayne has purchased the well-known Bull farm, on the banks of Cayuga Lake. This includes the famous "Bull's Grove" and the splendid woods, and is one of the finest lake-side farms in the State.

A young man of East Jaffrey, N. H., who went to Vineland, N. J., a few years since, to make his fortune raising grapes, and lost $2,000 worth in 1874 and $3,000 worth in 1875 by pests, has returned to his old home.

The Nurserymen of the Northwest are to meet at the Palmer House, in Chicago, on the second Wednesday of June next, for the purpose of organizing a Nurserymens' Association to promote the general welfare of the tree-growing interest.

A housekeeper in Des Moines, Iowa, having been much troubled by tramps who robbed his clothes lines and stole things generally, has published a card, warning all interlopers that he will shoot them on sight if they appear after nightfall.

An ox weighing 5,000 pounds arrived in Jersey City one evening last week by the Midland Railroad. He is five years old and twenty-two hands high. He rode in a hay car, the ordinary cattle car being too small. He was raised in Otsego Co.

The Maine State Ag. Society has fixed the time of its next Annual Fair for Wednesday, Aug. 30, to hold six days, thus keeping over the Sabbath—an experiment the necessity of which (we agree with the Maine Farmer in saying) is somewhat questionable.

The President of the Va. State Ag. Soc. has sent a communication to the Legislature of that State, asking an appropriation of $10,000, to be added to a like sum from the Ag. Soc., for the purpose of holding a State Fair at Richmond, as a partial compensation for Virginia's lack of representation at the Centennial.

Storrs, Harrison & Co. of Painesville, Ohio, have sent us their Spring Catalogue of New and Rare Plants for 1876, including Green-House and Bedding Plants—admirably arranged and illustrated. Also, their Catalogue of Fruits, Ornamental Trees, Shrubs, Bulbs, &c.,—and Semi-Annual Wholesale Trade Circular.

A bushel of oats and 400 lbs. of clover hay, will winter a sheep. With hay at $10 per ton and oats 40c. per bushel, the cost of wintering would be $1.40. If summering costs anything this does not leave much margin for profit except in the manure and opportunity to work up coarse feed not otherwise available.

The Executive Board of the Mich. State Ag. Society, at a late meeting, decided, by a vote of 15 to 5, to hereafter give no prizes for running or trotting — whereupon prominent owners of fast horses issued a call for a meeting of all horsemen at Lansing, the first Tuesday in March, with a view, it thought best, "to organize a State Horse Association, award premiums to all classes of horses, and also give premiums for trotting and running."

BUSINESS NOTICES.

769 Broadway, N. Y., want agents for the best money-making article in the world. Send for particulars.

For Coughs and Throat Disorders, use "Brown's Bronchial Troches," having *proved* their efficacy by a test of many years.

GOING HOME.

THE way is long, my darling,
The road is rough and steep,
And fast across the evening sky
I see the shadows sweep.
But, oh, my love, my darling,
No ill to us can come,
Nor terror turn us from our path,
For we are going home.

Your feet are tired, my darling—
So tired, the tender feet;
But think, when we are there at last,
How sweet to rest! how sweet!
For lo! the lamps are lighted,
And yonder gleaming dome,
Before us shining like a star,
Shall guide our footsteps home.

We've lost the flowers we gathered
So early in the morn;
And on we go with empty hands,
And garments soiled and worn.
But, oh, the great All-Father
Will out to meet us come,
And fairer flowers and whiter robes
There wait for us at home.

Art cold, my love, and famished?
Art faint and sore athirst?
Be patient yet a little while,
And joyous as at first.
For, oh, the sun sets never
Within that land of bloom,
And thou shalt eat the bread of life
And drink life's wine at home.

The wind blows cold, my darling,
Adown the mountain steep,
And thick across the evening sky
The darkling shadows creep;
But, oh, my love, press onward,
Whatever trials come,
For in the way the Father set
We two are going home.

The Story-Teller.

VALENTINE'S DAY,
AND WHAT IT BROUGHT TO LENORE.

BY MARY D. BRINE.

IT was Valentine's Day, and the postman who stood with a budget of dainty missives at the door of No. 49 —— St., improved the moments of waiting for response to his ring, by glancing across the way at No. 48, and pitying the lovely figure he never failed to notice, day after day, in the same seat, the same weary attitude, and with her pale, sad face always bowed over that endless stitching. "No valentines for the likes of her, 'tain't likely," he thought, "and she so pretty lookin' too!" and then his attention was called back to duty by bright little EFFIE WATERS herself, who came to the door and received her own letters, laughing merrily at the pile the carrier put into her eager hands.

The face at the opposite window turned towards EFFIE for just one moment, and a pair of wistful dark eyes noted the budget of valentines and letters fallen to the merry belle's lot, but nobody was near enough to hear the faint sigh which LENORE DE WOLF could not restrain, or to note the quick tears which sprang to eyes usually too proud to weep. But it was only for a moment; then, as the postman hurried on, and the seamstress knew he had nothing for her, she took up her sewing again and the tears were dried once more.

"Maybe I'll have one for her next round," thought the letter carrier, after he had taken a parting glance at the window of No. 48. And indeed for a whole year he had wished the same kind wish, but vainly, since, although there were plenty of letters for Miss CRAIG, with now and then one for the mother, and, I regret to say, an occasional *dun* on a postal card for the master of the house, yet nothing had ever come addressed to Miss LENORE DE WOLF. (The postman knew her name, for BRIDGET had told him,)—and the honest carrier's heart had learned to pity and sympathize with the lovely young seamstress—he knew her position in the family too, thanks to BRIDGET'S communicativeness.

Once, as he passed the house, the front door opened and a sweet voice asked, "Are you *sure* you have nothing for Miss DE WOLF, sir?" And the postman recognized the sweet, pale face, and wished in his heart he could have answered Yes. But he only shook his head and then, as he said to himself, "for a bit of encouragement"—"Maybe I might bring it on the next round, miss." That was the only time she had addressed him, and since then, a year ago, he had never seen her even turn her head when he gave his usual postman's call in the street.

Poor LENORE! She had indeed grown weary of expecting that which never came, and on this day, for the first time since despair had entwined her heart, she envied her pretty opposite neighbor her pile of letters. Well, at least she could read over, with memory's aid, certain letters of "long ago," and recall the dear past joys that lived when she lived her other life—when she was not LENORE DE WOLF, the seamstress in Mrs. CRAIG'S family, but Miss DE WOLF, the heiress and only child of her widowed mother. Miss CRAIG—upon whose ball dress LENORE was now sewing, pricking her small white finger, and wearing out her brave, dark eyes, while the young mistress herself sat in the parlor below reading the latest novel—imagined her father's home to be very fine and grand. And so it was—as fair and grand as the wealthy shoemaker could make it by continued industry in his business. But LENORE remembered—and the remembrance was so strong as to make it hard at any time to bear with patience Miss CRAIG'S smiles and insolent bearing towards the young dependant—a spacious mansion whose lofty rooms had echoed to the laugh of high-born ladies and gentlemen, her own laugh the gayest among them all. She could shut her tired eyes and see with mental vision the grand spiral staircase, up and down which ran lightly the delicate feet of maidens who would have scorned to count a shoemaker's daughter as one of "*their* set." She could see the walls of this fine old mansion hung with portraits, ancient and modern, of generations gone and those yet on earth. She could see as she last beheld them the noble works of distinguished sculptors, the statuary which gleamed in marble whiteness from every silken-draped alcove. She could hear the grand chords of music, the throbbing, pulsating music to which guests were moving gracefully; and again her own heart throbbed, as it had throbbed that last time to the swelling strains of the valse *one* had shared with her. There came before her the noble face of her mother, the high-born mistress of this grand old home; and LENORE remembered a portrait which hung in her mother's chamber, her father's portrait, and all of that father her young eyes had ever seen.

So long, so very long ago it was, since this sad dreamer and that light-hearted maiden were one. How did it happen that with the sudden death of her mother the property took to itself wings and flew beyond the orphan's reach? Ah! no one knows. How do strange things always happen? Enough for LENORE to know that not only was she orphaned and poverty stricken, but her heart was also robbed of the happiness which love had given, and *one*, the favored suitor of all who had sued her in vain, was lost to her forever; and the desolate girl, too proud to depend upon friends who knew her in better days, was glad to cross the water and find shelter in a strange land for her wounded pride and breaking heart.

And thus it had come to pass that LENORE DE WOLF, the once favored of fortune, became simply Mrs. CRAIG'S seamstress.

"Does the fine embroidery, you know, and ornamental work," explains Mrs. CRAIG to her intimate friend. "I shouldn't wonder if she had seen better days; she has really quite an air about her, and moves about my house quite as if she had lived as well all her days. It really amuses us to watch the girl!" Ah, Mrs. CRAIG; it is well for your complacency that you cannot enter into LENORE'S day dreams.

Five years is it since the seamstress left her native land to seek a home among strangers. Yes, LENORE remembers that after her mother's death, while yet the tears of grief were upon her cheeks, and even as she longed for the return of her lover from some distant city that he might comfort her in her affliction and help her to laugh to scorn the loss of her wealth lo! there came but these words from him instead:

"Farewell, LENORE. I forgive thee because so truly I have loved thee, my own! Henceforth HENRI shall be dead to thee—have thou no fear!"

Only these lines and the paper containing them was blistered as though the writer's heart had suffered in its pain a tear to fall upon his "farewell." And since then LENORE'S heart had never ceased its questioning of fate. "*Why* had her love sent her so strange a note? *What* had she done? And, oh GOD! *when* would her own faithfulness be made known to him who had never since that cruel time been heard from?" That somebody had plotted mischief between them she now had little doubt; but if ever on this earth they might meet again—ah! how could she know!

And so the weary days had passed. LENORE made a few friends in this land of strangers and maintained herself respectably, still retaining, in face and bearing, her native-born "air," as Mrs. CRAIG called it. Then one day she entered that lady's home as seamstress, and for one year, day after day, as we have described, her face was seen beside the window of the "second story front," and always, as the postman observed, at the same endless round of "stitch, stitch, stitch." And Miss CRAIG displayed to envying acquaintances her handsomely worked covers and cases, handkerchiefs, etc., and thanked her stars that "Mamma had at last secured a decent seamstress; why, the girl was *so* reserved, and pretended *such* exclusiveness, it was quite difficult to teach her her real position!" And LENORE, sitting alone in the quiet room, heard the loud-spoken and thoughtless words as they floated up through the register and smiled her scorn of the speaker. But it was not in her, because she was not a saint, to resist the impulse which led her to observe, when presently Miss CRAIG swept into the room to examine her work, "In future, Miss CRAIG, if it pleases you to discuss your seamstress, be kind enough to close the register, for I fear I am easily annoyed." And then she smiled at Miss CRAIG'S open-mouthed crimson-faced astonishment. Since that day there had been no more register-betrayed speeches, but LENORE was made to suffer for her reproof by a thousand and one annoyances and slights, only endured by the proud-spirited girl because of her entire dependence and need of employment.

And now we return to Valentine's Day. The long, bright day had almost passed, and twilight shadows were falling. Miss CRAIG had read her Valentines and confided to her tired seamstress her triumphs over hearts and admirers. And now she must rest awhile, for this was the night of her grand ball, ("nuisance of a party," as Mr. CRAIG called it,) and everybody in Miss CRAIG'S set was invited.

LENORE put the last finishing touches to the fluffy, gauze-like dress in which the young lady of the house would robe herself for the occasion, and pretty EFFIE WATERS from over the way stood idly drumming on the window pane, watching with pitying blue eyes the bowed figure of the seamstress, and wondering if the poor girl did not once in a while *envy* the gaieties she could not share. "Just look at her, mamma!" she exclaimed at last. "They do keep her working so, and now she's straining her poor eyes in this fading light just to finish BELLE CRAIG'S party dress. Too bad, isn't it?"

Mamma WATERS thought it was "too bad" indeed, and regretted that the rules of etiquette compelled EFFIE to attend the party that evening. The CRAIG'S were too boisterous a family to please this rather fastidious mother, but as neighbors some things could not well be avoided, and thus it happened that EFFIE was to share in the general "upside-down-edness" (as the paternal CRAIG styled it) of the CRAIG mansion that evening.

Darkness came to LENORE'S aid, and the busy hands laid finally at rest for a brief season.

"Buzz,—hum,—buzz!" LENORE up stairs in her small, dimly-lighted room, listened wearily to the ceaseless flow of small talk which, mingling with the sweeter strains of the music to which merry feet kept time, overflowed the house and crept into the street without—edifying a small crowd of street boys and beggars gathered to "see the fun:" LENORE'S heart borrowed a little of the gladness presently, as her thoughts were carried on memory's wings back to the dear old times past. "Ah, me! that is the valse which HENRI and I danced on the one glad night that he told me the secret of his love!" she murmured, her hands clasping themselves tightly together, and her cheeks crimsoning with the sweet remembrance. And little by little the glad, throbbing chords tempted her, the quiet listener, to a seat on the top stair of the shaded third hall, where, leaning her head against the wall, she listened to the joy she had, alas! no right to share.

EFFIE WATERS and Monsieur DE MONTVILLE had finished their waltz and passed from the parlors into the broad hall to rest and chat awhile. LENORE, who had been called upon to mend a rent in Miss CRAIG'S dress, and also was requested by that lady to remain in the dressing-room ready for similar mishaps to the guests, turned down a little the gas which troubled her tear-swollen eyes and seated herself on the low lounge again to think of happier times, and wonder what Miss DE WOLF'S friends would think, could they now see the humble seamstress in her position as *lady's maid*. Tears rushed to her eyes, and the small white hands clenched themselves with the tide of suppressed indignation, unuttered though so keenly felt. And gradually the tired head drooped, the tear-stained eyes closed, and LENORE was speedily transported from pain and sad memories to the once stately home and joys of her own dear land—vivid and real as dreams could make them.

"My fan!" exclaimed EFFIE, soon after. "I must have left it in the dressing-room. "Excuse me while I go for it," she said; but Monsieur DE MONTVILLE gallantly requested the pleasure of serving her; the maid would give it to him, and in one moment Miss EFFIE should receive it from his hands. And the handsome figure—the lion of the rooms and "catch of the season" ran lightly up the staircase, leaving bright-faced EFFIE, the sister of this same lion's warmest friend among America's sons and his chosen partner for the evening, to dispense her smiles to a few patiently-awaiting admirers thus far unable to secure her.

Only a dimly-lighted room, and to the Frenchman's embarrassment no waiting-maid to search for the missing fan. What could he do but step softly in and himself try to find it. So the gas was raised and the gentleman turned. Ah! who was she whose head was bowed against the arm of the small lounge whereon she sat? No more remembrance of the fan!—no more thought of the company below!—only a wild desire to look closer upon that pale, sleeping face which years of separation had not driven from his memory.

But LENORE stirred and opened her eyes, and instantly remembering where he was, HENRI DE MONTVILLE slipped from the room and trembling with excitement rejoined EFFIE. "Come with me," he whispered; "come with me there," pointing to a deserted room beyond; and EFFIE, wondering at his excitement, followed him unobserved. Then and there HENRI DE MONTVILLE questioned EFFIE imploringly concerning the girl who, despite her position as seeming lady's maid, was, his heart made him sure, one whom in five years he had not forgotten, nor had he ceased to love. EFFIE knew his story—knew it from her brother's lips, for a thousand times had the young Frenchman told it to his warm and sympathetic friend, only reserving the name of his lost love as something too sacred to be betrayed. And EFFIE,

THE FIRST VALENTINE—(See page 111.)

wishing with all her heart that his grief might thus find happy ending, told willingly all she knew concerning Miss CRAIG's seamstress.

"LENORE, you say!—LENORE! Ah, *now* I am sure! I knew there was but one face like that in all this world!" he exclaimed passionately. "And *my* LENORE, whom I loved—LENORE DE WOLF, my once promised wife, is here in this family, a *seamstress!*" Could Miss EFFIE arrange that he might meet her that night? How could he leave the house without speaking to her whom he thought he had lost forever?

All this and much more he asked of EFFIE, and she promised—as what warm-hearted girl of seventeen would not have promised?—to render all assistance to the long-parted lovers. Through another miserable dance, for Mrs. GRUNDY's sake, they walked, EFFIE and the impatient HENRI, whose thoughts were all in the dimly-lighted room above. Then on a card he scribbled a line which EFFIE, with a rueful face over a pretended mishap to her dress, took up to the tired girl who waited in the dressing-room.

"O, Miss WATERS, I think I must have slept;" said LENORE as EFFIE softly entered, "for some one came in and raised the gas which I had turned down. And I fear Miss CRAIG will think me very careless of my duty."

"Your duty," said EFFIE smiling, "is to read this card and be brave as *you* can be," putting the card into LENORE's hand.

"HENRI DE M—— is here! O, LENORE, let me come to you, for there has been a wrong done to us both, I fear!"

One wild, imploring glance at EFFIE—one faint prayer—"O, Miss WATERS, tell me it is not a cruel jest!" and then Miss CRAIG's seamstress quietly floated into that strange middle world of unconsciousness, and poor, frightened little EFFIE, who had never seen any one faint before, almost drowned the fainting girl with the pitcher of water near by—for water, she had heard, "was always used to bring people to."

Did they meet that night? Well no, because Mrs. GRUNDY'S rules came between the longing hearts of the two so long kept apart. But HENRI slept (?) the remainder of the night under Mrs. WATER'S roof, while LENORE walked her room and longed for daylight, and read her Valentine (oh, yes, *her* Valentine come at last) over and over, and kissed the name it bore until her happy tears had almost blotted it out of sight.

And from HENRI himself Miss CRAIG was informed *whom* she had been honored with as seamstress in her house. From HENRI she learned of LENORE's former position, and was fain to hide her head with shame as she remembered her own uncalled-for arrogance.

How did it end? As such things always do end, of course—and as this is truth, it follows that it is *stronger than fiction*. The postman heard, through BRIDGET, of LENORE's Valentine after all; and not very long after Miss CRAIG beheld from her window the arrival at Mrs. WATERS' of Monsieur and Madame DE MONTVILLE as honored guests and friends.

HENRY WILSON'S EARLY LIFE.

THE following interesting incidents in the life of the late ex-President WILSON, as told by himself, are given by a writer in the N. Y. Tribune:

"I was born," he said, "in 1812, and at the age of ten years was put out as an apprentice to a farmer. From the day of my birth to the day I was 21 years old I never had a dollar in money to spend for anything. During the whole of my apprenticeship my master never but once gave me a penny. On that occasion he allowed me a holiday with permission to attend a muster seven miles from home, and gave me three cents to spend. I walked to and from the muster, and of course spent no more than that sum.

"On the day I was 21 years old—I remember it very well, one Saturday, the 16th of February—in the afternoon, my master gave me a yoke of oxen and six sheep. The latter I sold the same afternoon for $9, but, not being able to dispose of the oxen that day, I requested my master to keep them for me until Monday morning, which he did, but charged me 50 cents for it. I paid him this and took the oxen away. I sold them to a man for $75, and took his note for the amount. So when I became of age I had for eleven year's work (I was sent to school only four weeks each year) $84. I had saved 57 cents, which I had in some way obtained, but I had paid 50 of this to my master for keeping my oxen two nights. I then hired myself to a farmer, agreeing to work for $6 a month and board. I used to get up long before daylight, feed the stock, get my breakfast, and, just as the east was beginning to be streaked with red, start off for the woods with my team. I used to place my dinner-pail on the sunny side of a tree, and continue drawing saw-logs to the mill until after dark at night. Then I went home, fed the stock, ate my supper, and went to bed. My father tended the saw-mill most of the time for many years for 50 cents a day.

"In the spring of the same year, I took my pack upon my back and started afoot for the town where I now live, Natick, Mass., 100 miles away, and that journey cost me just $1.25. I worked there at shoemaking, averaging 15 hours a day, and the last week's work I did at the bench was at bottoming shoes for $5 a week. Out of this I paid 50 cents for pegs and $2 for board, so that I had left just $2.50. I have bottomed 54 pairs of men's shoes without sleeping, and that for a little more than 50 cents. But even at this rate I got some money ahead, and made up my mind to work my way through college. I lent my money to a man in Boston, and went to the Academy at Concord, N. H. I had been there only six (three?) months when the man, to whom I had intrusted my fortune, failed, and I lost it all. I was so reduced that, although I owed for two or three week's board, I was absolutely unable to pay it, or even to take a letter from the Post-Office without borrowing money to pay the postage. But a friend invited me to remain and board with him, and pay him when I was able. So I stayed through the term, and in the Winter earned money enough to pay him by teaching school. Now the men who are working at shoemaking 10 hours a day, and earning from $3 to $5 a day, complain.

A GOOD NAME.

THE other day a young African asked us if it were "agin de law" to change his name. We replied that if he had a good name he had better keep it, as a good name was one thing to be desired in this world.

"I'se got a pretty t'ar name," he said, "wat I'se had eber since de war, but it won't do for dise chile eny moah."

"Why, what's the matter with it?" we asked.

"Well, you see, boss, dar's a fool nigger come hyar from Chillicothe, an' he's a buzzin' around wid my name, and no two niggers can cirgumgate in the same town unless one or de uder ob 'em hab a different prodogneem."

"Perhaps you can prevail on him to adopt another name."

"No, sah; I offered him fo'ah bits and a rahzor to call hisself something else 'sides Geowge Washin'ton Jones, but the yaller fool won't do it."

"Yellow, is he?"

"Yes, sir, an' dat's what make me so injurious 'bout it. He says de Joneses was the furstest families in Firginny, and dat he's condescended in a direct line from dem, an' consequenchly darfo'ah values de name moah exceedingly dan uderwise."

"So you propose to off with the old name and on with a new?"

"Somethin' like that, I s'pose, boss. An' I wants to ax you de favor to sejest some disappropriate name dat'll do for a cullud pusson oh standin'. I don't soshate wid de common low-class niggers, and I wants a name o' dere uncomprehension—wat dey can't steal, you know."

"How'll Benedict Arnold do?"

"De Arnold an tonish, for suah, but dar's too many Bennys and Dicks around. Try anudder one, boss."

"Well, Algernon Sartoris, how's that?"

"Dat's superlugant! Algerneyman Sartoris Arnold—dat'll do fur some ob de name. Please reach fur anuther one, sah."

"Why, that's name enough. How much do you want, for goodness sake?"

"Boss, you must 'member dat I'se deekin in de church, an' 'prietor ob a house an' lot."

"Oh! yes; well, let's see—Bill Allen?"

"Dat's too common."

"Abraham Lincoln."

"Too ordinary, sah. Git up higher."

"Phil Sheridan?"

"Higher yet, sah, if you please."

"William Tecumseh Sher——"

"Stop, sah, dat's nuff—needn't feel no furder. Wilyum Cherkumsey—dat sounds like Old Kaintuck—Wilyum Cherkumsey Algerneyman Sarteris Arnold! Yes, sir, dat'll do—no low-class nigger can get inside o' dat. You'se de solum witness, boss, dat dat's my name from henceforth on to all precedin' time. I'se obliged to you, sah."

As he walked majestically away, repeating the name over to himself, he was the proudest darkey in Brunswick. And yet Shakspeare says there's nothing in a name.—*Missouri Brunswicker.*

THE OUTSIDE PASSENGER.

THE Boston Commercial Bulletin tells this may be true story:

It was in the days of stage-coaches, and one of those huge, lumbering vehicles, was ploughing its way between Boston and Salem in a driving rainstorm, filled inside and outside with a jolly set of passengers.

Among the number of the more fortunate insiders was a respectable, bald-headed old gentleman, who seemed to be very solicitous about a lady riding on the roof. Every few minutes he popped out his head, regardless of the rain, and shouted to some one above, "Well, how is she now?" And the answer came, "All right."

"Is she getting wet?" inquired the old man.

"No, not much," was the reply.

"Well, can't you put something round her? 'Twill never do to have her get wet, you know."

"We've got everything around her we can get."

"Haven't you got an old coat or rug?"

"No, not a rag more."

A sympathetic young man, hearing all this, and feeling alarmed for the poor lady out in the storm, inquired of the old gentleman why they didn't have her inside, and not on the roof?

"Bless you, there ain't room!" exclaimed the old man.

"Not room! Why, I'll give her my place; it's too bad."

"Not at all, sir; not at all. We couldn't get her into this stage anyhow."

Amazed at her prodigious dimensions, the kind young man said, "Well, sir, if my coat would be of any service to you she may have it;" and, suiting the action to the word, he took the garment and handed it to the old gentleman.

"It's almost a pity, sir, to get your overcoat wet, but——"

"Not at all, sir; by no means: pass it up to her."

The coat was accordingly passed up.

"How'll that do for her?" asked the old gentleman.

"Tip-top! Just the ticket! All right now.

Thus relieved, no further anxiety was manifested about the outside passenger till the stage arrived at the inn, when what was the sympathetic and the gallant young man's surprise and indignation to find that his nice coat had been wrapped around—not a fair young lady of unusual proportions, but—a double bass viol.

THE PODDLES FAMILY.

PODDLES, JUNIOR, has unfortunately an ear for music—two much so, in fact. In this he bears no resemblance to Poddles, *pere*, whose musical notions are so vage that he can with difficulty distinguish his favorite air, "Old Dog Tray," from "The Irish Washerwoman."

Whenever Poddles, Jr., is relieved from the laborious occupation of devouring bread and molasses, he is either whistling or singing. His *repertoire* of airs is extensive, comprising all those furnished by the street musicians and concert halls. No matter though he be perusing the most exciting pages of "Jack Harkaway," this youth indulged in song at the same time, totally oblivious of the fact that others cannot appreciate his music when similarly engaged.

The other evening his father entered the room, where the junior, seated in his favorite rocking-chair, with one leg over an arm, was filling the house with that well-known air, "Up in a Balloon."

"Thomas, where did you put the market basket this morning?" demanded the senior.

"Down in a coal mine, underneath the ground," sang the junior, without looking up.

"Down where?" sharply inquired the senior, who is a little deaf.

"Where a ray of sunshine never can be found," yelled the youngster.

"Can't, never be found, hey? you young rascal," shrieked the elder party, making a break for his son and heir. "What do you mean? Answer me directly."

"Yes, pap; what is it?" 'Sweet Genevieve, sweet Gene——'"

"I'll sweeten you, young imp. Mrs. Poodles, this all comes from that boy reading dime song books, 'Jack Harkaway,' and similar stories. Come, sir (threateningly), where's the market basket?"

"In the cellar, pap. 'Put me in my little bed,'" he shouted.

"Very good. Be off this instant," replied the senior, taking the junior at his word, and before that misguided little musician could well realize the turn affairs had taken he was quickly trotted off bed-ward to the enlivening tune of the "Mulligan Guards."

An hour afterward a faint voice from the attic was heard imploring forgiveness, mingled with the plaintive song of the Madrigal boys, "Good night, good night, good night."—*Danbury News.*

HOW THE WIDOW CAUGHT HIM.

A GENTLEMAN of an autobiographical turn relates how he was instructed in the custom of taking toll by a sprightly widow during a moonlight sleigh ride with a merry party. He says:

The lovely widow L—— sat in the same sleigh, under the same buffalo robe with me.

"Oh, oh,—don't, don't!" she exclaimed, as we came to the first bridge, at the same time catching me by the arm and turning her veiled face toward me, while her little eyes twinkled through the moonlight.

"Don't what?" I asked. "I'm not doing anything."

"Well, but I thought you were going to take toll," replied the widow.

"Toll?" I rejoined. "What's that?"

"Well, I declare!" cried the widow, her clear laugh ringing out above the music of the bells, "you pretend you don't know what toll is!"

"Indeed, I don't, then," I said, laughing; "explain, if you please."

"You never heard, then," said the widow, most provokingly, "you never heard that when we are on a sleigh-ride the gentlemen always—that is sometimes—when they cross a bridge claim a kiss and call it toll. But I never pay it."

I said that I never heard of it before; but when we came to the next bridge I claimed the toll, and the widow's struggles to hold the veil over her face were not enough to tear it. At last the veil was removed, her round, rosy face was turned directly toward mine, and in the clear light of a frosty moon the toll was taken, for the first time in my experience. Soon we came to a long bridge with several arches; the widow said it was of no use to resist a man who would have his own way, so she paid the toll without a murmur.

"But you won't take toll for every arch, will you?" she said, so archly, that I could not fail to exact all my dues; and that was the beginning of my courtship.—*Providence Journal.*

SILENT MEN.

WASHINGTON never made a speech. In the zenith of his fame he once attempted it, failed, and gave it up, confused and abashed. In framing the Constitution of the United States the labor was almost wholly performed in Committee of the Whole, of which George Washington was the Chairman. He spoke twice during the Convention; but his words were so few that they could not fitly be termed speeches. The Convention, however, acknowledged the master spirit, and historians affirm that, had it not been for his personal popularity and the sincerity with which he spoke, the Constitution would have been rejected by the people. Thomas Jefferson never made a speech. He couldn't do it. Napoleon, whose executive ability was almost without a parallel, said that his greatest trouble was in finding men of deeds rather than words. When asked how he maintained his influence over his superiors in age and experience, when Commander-in-Chief of the army in Italy, he said, "By reserve." The greatness of a man is not to be measured by the length of his speeches or their number.

Sabbath Reading.

APART.

BY ROSE GERANIUM.

AH me! the graves that will not fold
Their generous mantles o'er the dead,
But with remorseless fingers hold
The frames which being long hath fled!

Yet still, with steps that quivering go,
Our ways among them we must take,
Haply, if tears that scalding flow,
May bathe the weary hearts that break.

How hard to watch the changeful eyes
Thro' years of solitary pain,
With love that lisps her ceaseless cries—
To watch and pray and watch—in vain!

To touch the hands, nor feel a thrill
Of answer through the pulses steal—
To know dumb silence watches still
The bosom that will not unseal.

O GOD! in other plans than these
Shall Sovereign hands the shadows bend,
And souls which holy Morning frees
Find recognition in the end?

A GREAT AUTHOR'S BELIEF.

VICTOR HUGO, at a recent dinner party in Paris, gave free expression in the presence of atheists to his belief in the infinite and in the soul's immortality. Hugo's face was bright with a heavenly halo and his eyes shone like burning coals.

"There are no occult forces," said he; "there are only luminous forces. Occult force is chaos, the luminous force is GOD. Man is an infinitely little copy of GOD; this is glory enough for man. I am a man, an invisible atom, a drop in the ocean, a grain of sand on the shore. Little as I am, I feel the God in me, because I can also bring form out of my chaos. I make books which are creations. I feel in myself the future life. I am like a forest which has been more than once cut down. The new shoots are stronger and livelier than ever. I am rising, I know, toward the sky. The sunshine is on my head. The earth gives me its generous sap, but heaven lights me with the reflection of unknown worlds. You say the soul is nothing but the resultant of bodily powers. Why, then, is my soul the more luminous when my bodily powers begin to fail? Winter is on my head and eternal spring is in my heart. There I breathe at this hour the fragrance of the lilacs, the violets and the roses, as at twenty years. The nearer I approach the end, the plainer I hear around me the immortal symphonies of the worlds which invite me. It is marvelous, yet simple. It is a fairy tale, and it is history. For half a century I have been writing my thoughts in prose and verse, history, philosophy, drama, romance, tradition, satire, ode and song. I have tried all. But I feel I have not said the thousandth part of what is in me. When I go down to the grave I can say, like so many others, 'I have finished my day's work,' but I cannot say 'I have finished my life.' My day's work will begin again the next morning. The tomb is not a blind alley; it is a thoroughfare. It closes on the twilight to open with the dawn."

A DELIGHTFUL LEGEND.

THERE is a beautiful legend connected with the site on which the Temple of Solomon was erected. It is said to have been occupied in common by two brothers, one of whom had a family, but the other had none. On the spot was a field of wheat. On the evening succeeding the harvest, the wheat having been gathered in shocks, the elder brother said to his wife:

"My younger brother is unable to bear the burden and heat of the day. I will arise, take off my shocks and place them with his, without his knowledge."

The younger brother, being actuated by the same benevolent motives, said within himself:

"My elder brother has a family and I have none. I will contribute to their support. I will arise, take off my shocks and place them with his, without his knowledge."

Judge of their astonishment when, on the following morning, they found that their respective shocks were undiminished. This course of events transpired for several nights, when each resolved in his own mind to stand guard and, if possible, solve the mystery. They did so, when, on the following night, they met each other half way between their respective shocks with their arms full.

Upon ground hallowed by such associations as this was the Temple of King Solomon erected—so spacious, so magnificent, the wonder and admiration of the world. Alas! in these days, how many would sooner steal their brother's whole shock than add to it a single sheaf!

THOUGHTS FOR THINKERS.

A GOOD man and a wise man may at times be angry with the world, at times grieved at it; but it is certain that no man was ever truly discontented with the world if he faithfully performed his whole duty in it.

THE wounds of CHRIST were the greatest outlets of his glory that ever were. The divine glory shone more out of his wounds than out of all his life before.

IT is easier to find a score of men wise enough to discover the truth than to find one intrepid enough, in the face of opposition, to stand up for the same.

Ladies' Portfolio.

THE FARMER'S DAUGHTER.

BY ANNIE L JACK.

SHE lives within a quiet home,
No model of the graces,
Unknown to culture's higher walks,
Or fashion's giddy places:
A thoughtful girl, so sweet, so wise
With earnest face and loving eyes—
The farmer's gentle daughter.

From morn till eve the little maid
Is busy at her labor—
She sweeps and dusts the old farm house
And helps a poorer neighbor;
No gossip will she listen to
(A merit rare, I own to you)
So lives the farmer's daughter.

On baking days her tiny hands
Are busy at the making:
No bread more light and sweet than hers,
Was ever made by baking.
She churns the butter golden, sweet,
And keeps the dairy white and neat—
The farmer's useful daughter.

Her garden is an Eden fair,
A-bloom with pinks and roses,
She knows the name of every flower,
And makes some gorgeous posies,—
Grows peas, and radishes, and cress,
And corn, and squash, and herbs to press—
The farmer's happy daughter.

Long may she bravely smile on us,—
Our darling household fairy,
The queen of garden, house and lot,
And princess of the dairy—
To teach us by her pleasant way
To love the things of every day—
God bless the farmer's daughter.

SOFT SOAP, WITH PLENTY OF LIE.

BY MRS. HATTIE F. BELL.

"OH, dear! There comes that horrid Mrs. JONES again! ALMIRA, do run and put that new basque pattern of mine out of sight, for she'll be sure to ask me for it if she sees it. Her prying eyes are in every corner, and she's never in a hurry to return anything, either. What a shabby old bonnet she's got on; and as sure as my name is STUBBS if she hasn't got that homely young 'un of hers with her. He's five years old, and squalls more than any six-months-old baby I ever saw. And that's her same old dress, too, ain't it? Of course she'll stay all day. Dear! how I detest her. I wish she was in France. Well, I may as well open the door. I suppose she'd rap her knuckles off but what she'd get in.'

"Why, my dear Mrs. JONES, how do you do? I was just saying to ALMIRA, this morning, 'How I do wish Mrs. JONES would come over and spend the day! It's an age since I've seen her.' And I'm glad you brought JIMMIE, too—dear little fellow! As I was telling ALMIRA, he's such a brave and gentlemanly little boy. I was afraid when you did come you'd leave him at home. As I told ALMIRA, 'taint often you see such a nice little boy. Take off your bonnet, Mrs. JONES; what a beauty it is! As I was telling ALMIRA, this morning, 'Mrs. JONES is such a tasty woman.' You always have the prettiest bonnet in the meetin' house. Why, if you hain't making another new dress! I don't see what you want of another, so many nice ones as you've got now. Why if I had half as many I'd feel rich as a queen. Now if my new basque pattern was only home, I'd let you have it, but Miss SAMPLE she had to up and borrow it before I'd a chance to use it myself. As I told ALMIRA, 'Now, Mrs. JONES wouldn't do so.' You're always so particular about such things. I'd send ALMIRA right over there after it, but I know she wouldn't get it.

"What! are you going so soon? Why, as true as the world it is past supper time. I meant as much as could be to have you stay to tea. I told ALMIRA 'twould be just like you not to stay, but I had set my heart on it, after all. Well, I don't like to urge folks out of their way. If you must go, you'd better walk fast, as it looks like rain, and 'twould be a pity to spoil your bonnet."

Mrs. JONES departs, thinking what a firm friend she has gained in dear Mrs. STUBBS. "Where ignorance is bliss 'tis folly to be wise."

MAPLE BUDS.

No. I—Teaching not Child's Play.

BY MAY MAPLE.

"I HAVE got through with arithmetic, algebra, geography, grammar and philosophy,"—why it fairly takes one's breath to think what a prodigy it is—writes a child of twelve years. And then she asks if we do not think she can teach school in a year or two. If the little girl means to teach a public school, we should answer most decidedly,—if she were our daughter,—"*No, no.*"

Not less than seventeen years should crown the child's head when she burdens her young shoulders with the responsibilities and cares of a teacher. When she takes upon herself the honor—and an honor it truly is, to be a teacher,—she must make up her mind to incessant labor; ever to be at her post through storm or sunshine, through summer's heat and winter's snow. She will have all sorts of dispositions with which to deal; some that will be extremely stubborn and disagreeable to encounter, both inside and *outside* of the school-room. She will need to sip largely from JOB'S fountain of patience; and although she has eaten quite heartily from the Tree of Knowledge, we think a little of SOLOMON'S wisdom will do her no harm if taken as dessert.

Teaching is not, or should not be, child's play. We think most likely the little girl may be very successful in teaching a select school, and might commence immediately, if she can have a good assistant in the form of a thoughtful, intelligent, loving mother. But we would suggest that the lessons taught be in the branches of Self-government, Self-reliance, Domestic Economy, General Intelligence, Patience and Humility; and that the number of scholars be limited to *one*, and that one, herself. These sciences well studied and practiced for the next ten years, then thoroughly reviewed in company with the school books that she now imagines she is "through with," and our word for it she will make a better teacher and a nobler woman than if she goes into the school-room "mistress of ceremonies," with her childish smattering of wisdom, at the too early age of fourteen.

HOW LITTLE BOYS CAN HELP.

"OH, these boys;" says MARY. "Isn't it queer how well it rhymes with noise?—In fact as if it was made on purpose."

We looked up and there they were—three sturdy little fellows, strong, rosy-cheeked and full of fun, crowding each other as they stood over the stove and snuffed the air and teased sister MARY to find out what nice smell foretold a savory dinner. Then "mother" came in. "Ah, WILL," she said, "can you clean the knives? We are busy, and *that* dinner would hardly cut with a dirty knife. JAMIE, a few sticks of good wood from the shed will make that pudding *boil* grand (with emphasis). Now, STANTON, wash your hands and face, and help set the table; be sure to lift all the dishes with two hands; they cost so much when we have to go to the store for new."

In a few moments the restless boys were transformed into little housekeepers, busy with light work that saved the girls many steps, and in after years would be useful to them as a lesson well learned. The boys of a household after they grow old enough are often worked too heavily; but many a mother with a group from four years old to ten, does not know that they can be made useful in many ways, and doubly happy in being able to do mother's work. In the family where this took place a boy of seven takes turn with another of nine to do the churning in one of the light, patent Blanchard Churns. True, there is only the milk of two cows, but it is fun for them to do it and a miniature pad of butter is an ample reward; at the same time noise is utilized, and so are boys.

ANNIE L. J.

PROMISED LAND FOR WOMEN.

OLIVE HARPER writes of domestic life in Greece, that in one respect it is the promised land for women; for the husbands, in devotion to their wives, are themselves their only parallel. She says:—A Greek man is only content when he can lavish upon his wife all the luxuries in the way of dress the female heart can desire. He is only happy when, in company with his wife in the house, in the garden or on the promenade, she is the best dressed of all the fair. With the Greek husband there is no grumbling consent to bestow upon you enough to buy a pair of boots, while he spends ten times that amount with his friends in champagne suppers; no long-drawn visage as he doles out a stingy sum, while delivering a solemn lecture as to female extravagance. Not a bit of it. On the contrary, the Greek husband does not lead his wife through by-streets for fear of dry goods stores when she wishes to go out for a little walk. He leads her, on the contrary, past the most fashionable stores, and observes, with the eye of a critic, all the new styles, and is really and truly willing to spend his money for his own wife. Even for fear that she should not be considered so lovely as some one else, he goes to a perfumer's, he buys cold cream, rice powder, delicate pinks for cheeks a little blanched by the stern realities of motherhood; he buys a little black for eyelashes, to brighten eyes that have become somewhat dimmed by tears, perhaps, or vigils over sick babies, and he not only gives his full and free consent to their use, but he himself will artistically apply them, and afterward compliment his wife upon her beauty till her heart swells with love that he knows so well how to retain, fresh as when the first vows were plighted. Yes, of a verity, the Greeks are bad men, but good husbands and tender fathers.

THE whole story of human life is compressed into this dainty little poem by Jean Ingelow:

Sweet is childhood—childhood's over
Kiss and part,
Sweet is youth; but youth's a rover—
So's my heart.
Sweet is rest; but by all showing
'Toil is nigh.
We must go. Alas! the going.
Say "Good-by."

KEEPING BIRTHDAYS.—It is not generally known that the good custom of keeping birthdays is many thousand years old. It is recorded in the fortieth chapter of Genesis and twentieth verse; "And it came to pass the third day, which was Pharaoh's birthday, that he made a feast unto all his servants."

A HAT made of human hair was recently sent to a Chilian exhibition by a Guatemala woman, the material of which came from the heads of her two daughters. Hereafter young ladies are expected to present their lovers, not with a lock of hair, but with a hat of hair.

HE that thinks innocent pastime foolish has either to grow wiser, or is past the ability to do so; and we have always counted it an impudent fiction that playfulness is inconsistent with greatness. Many men and women have died of dignity.

Reading for the Young.

THE FIRST VALENTINE.

(SEE ILLUSTRATION ON PAGE 109.)

RAT-TAT at the door! Rat-tat at the door!
Here are Valentines one, two, three;
There is one for Harry, and one for Will,
And a big one for girlie! See,
Wildly she flies o'er the nursery floor,
Never was girlie so happy before,
As she shouts in her baby glee—
"Oh, I've got a Valentine, all come look,
As big as the sheet of a picture-book!
Now don't you wish you all, like me,
Had a great big heart painted red, you see?"

All day long—now in, now out—
Now up, now down—she wanders about,
Showing her treasure, 'tis fast getting torn,
But paper, we all know, is very soon worn.
"Who do you think can love me the most
To buy this, and send it along by the post?
Do look again, you must like to see,
'Tis a great big heart, and it 'longs to me,
And please to read me the written line
That says, 'God bless you, sweet Valentine!'"

WHAT THE ROSE TOLD THE BUTTERFLY.

TIRED of roaming about from flower to flower, and, strange as it may appear, a little sick of honey, the beautiful butterfly, with the rainbow-tinted wings, stopped, at the end of a long summer afternoon, to take a few moments' rest on the branch of a fragrant rose-tree.

As he did so, he spied just above him a big brown caterpillar, slowly eating its way through one of the largest of green leaves.

"Well," said the young butterfly, opening wide his wings, so that all the roses and buds might see their brilliant colors, "that is a queer looking thing. It don't appear to have any legs, and it's very ugly. I've half a mind to speak to it."

Then he had a whole mind, and spoke. "Hallo! my friend" (his friend, indeed!)—"you with a fur coat on—in such warm weather, too. How very odd, when one feels like wearing no coat at all. What are you?

"What you were once yourself," answered the caterpillar, gruffly, raising its head for an instant, and then quietly going on with its meal.

"I!" said the butterfly, standing on the tip of his toes in his great astonishment, "Well, that is a good joke. I ever anything like you! The idea is absurd, ridiculous! I fly; you crawl. I feed on honey; you on green leaves. I, to speak plainly, am beautiful; and you, to speak still more plainly, extremely not beautiful. Oh, no! my funny fellow. You've made a great mistake, or else told a great——"

"Stop, stop!" said a sweet voice, and a lovely crimson rose leaned toward the indignant speaker. "The caterpillar has spoken the truth."

"Why, how do you know, pretty one?" asked the butterfly.

"The grape-vine told me all about it," replied the rose.

"And I should feel obliged if you would tell me all about it," said the butterfly.

"With pleasure," said the rose, and began: "When I was a bud I used to peep through my green lattice-work at a tiny cradle or hammock, or something of that sort, that hung from a branch of the blackberry bush just opposite, and wondered what was in it. It never stirred only when the breeze came along and stopped to rock it for a few moments; when one day, as I was watching and wondering, it burst asunder, and you, most beautiful of butterflies, came out—"

"Yes, yes, I remember that," interrupted the butterfly, forgetting his politeness in his impatience. "But what has that to do with my ever being like a caterpillar?"

"Like a caterpillar," muttered the fur-coated one, with his mouth full. "Oh! yes, indeed! Very like!"

"Have patience," said the rose, "and you shall hear. At the moment you first unfolded your wings the grape-vine behind me flung out a pretty tendril and caught me around the stem."

"'Ah, I have you now, Queen of the Rosebuds,' said he (he's a merry fellow, always full of fun); 'and I shall hold you until you tell me what you are thinking about.'

"'I don't mind telling you at all,' said I. 'I was wondering what was that just opened and let out a lovely butterfly.'

"'That,' said the grape-vine (who is ever so old, years old, and knows everything that is to be known about a garden)), 'that, sweetest of sweet, wee blossoms, was a caterpillar's coffin.'

"'A caterpillar's coffin!' repeated I, in great surprise.

"'Yes. When a caterpillar gets tired of being a caterpillar it makes for itself a coffin, and into that coffin it goes a caterpillar and out of it comes a butterfly. Don't ask me to explain, pinkest of pink buds. I can't, though I've seen it done over and over again.'

"'How funny!' said I, and I slipped away from the tendril that was holding me.

"'You sly little thing,' said the grape-vine; 'I'll catch you again—see if I don't—the very next time you are thinking.'

"So, though it may seem absurd and ridiculous to you now, velvet-winged butterfly, you must have once been a caterpillar. But I suppose sleeping so long in that coffin, as the grape-vine called it (I'd rather call it a cradle), has made you forget all about the days you had no wings and looked as though you had no legs."

"Well," said the butterfly, unfolding his wings ready for flight, "I must say, if all the caterpillars in the world had told me I had ever belonged to their family I wouldn't have believed them. But, as you say, sweet crimson rose, the grape-vine is old and knows everything. I think there is such a thing as being too old and knowing too much. I suppose I must accept his story as the truth. Good evening," and away he flew, feeling much less pleased with himself than he did when he first spied the caterpillar.

"Thank you. You're as clever as you are lovely," said the caterpillar to the rose, as soon as he had gone.

"Glad you think I'm lovely. Sorry I can't say the same for you," replied the truthful flower. "You're not pretty—not at all; and really I don't like the way you eat my green leaves. Do stop and wind yourself up in your cradle and coffin, or whatever it is, and turn into a butterfly as soon as possible. Won't you?"

But the caterpillar kept on eating. He wasn't ready for his coffin just yet. So the rose turned her back on him and began to throw kisses to the slender white lily that grew in the next garden and was deeply in love with a humming-bird.—*Independent.*

The Puzzler.

ILLUSTRATED REBUS.—No. 5.

☞ Answer in two weeks. L. G.

LITERARY ENIGMA.—No. 1.

I AM composed of 42 letters:
My 3, 30, 17, 1, 12, 5, 14, 41, 35, 28, 26, 40 is a poem by Longfellow.
My 20, 14, 10, 8, 32, 40, 6, 2, 34, 39, 14, 42 is a novel by Dickens.
My 23, 14, 23, 14, 24, 26 one of Tennyson's idyls of the King.
My 13, 4, 21, 32, 33, 23, 17, 34, 15, 23, 14, 18, 14, 28, 26 is a poem by J. G. Saxe.
My 15, 25, 16, 41, 19, 14, 27, 7, 29, 14, 33, 26 is a sonnet by Mrs. Browning.
My 1, 22, 34, 32, 38, 31 the name of an artist.
My 23, 22, 41, 11, 36, 14 is a novel by Augusta Evans Wilson.
My 37, 22, 31, 24, 9 hero of "My Wife and I."
My whole is a quotation from Longfellow.
☞ Answer in two weeks. M. E. B.

BIOGRAPHICAL ENIGMA.—No. 1.

I AM composed of 51 letters:
My 17, 4, 17, 6, 22, 8 a great orator of old.
My 5, 11, 17, 1, 2, 22, 27, 21, 33, 25, 32, 38, 48, 40, 44, 26 a female editor.
My 50, 46, 35, 37, 29, 22, 42, 51, 38 a novelist.
My 3, 13, 7, 34, 41, 36, 9, 16, 38, 10, 18, 22, 12, 49, 15 a female lecturer.
My 31, 11, 15, 39, 46, 6, 24 a French writer.
My 43, 23, 47, 7, 16, 22 a Scotch antiquary.
My 28, 21, 14, 4 an artist of Socity.
My 20, 21, 36, 30 a canon of Rouen, France.
My 45, 19, 18 a divine of the court of Louis XIV.
My whole is a translation from Cicero.
☞ Answer in two weeks. LITTLE ONE.

CROSS-WORD ENIGMA.—No. 4.

My first is in found but not in lost,
My second is in purchase but not in cost;
My third is in come but not in go,
My fourth is in bread and also in dough;
My fifth is in stool but not in seat,
My sixth is in corn but not in wheat;
My seventh is in rain but not in snow,
My eighth is in fast but not in slow.
My whole is a village in the western part of New York.
☞ Answer in two weeks. JESSIE S. H.

BIBLICAL SQUARE-WORD.—No. 1.

1. A DESOLATE valley. 2. A king of the Amalekites. 3. A village of Galilee. 4. An Arabian name for Mount Sinai.
☞ Answer in two weeks. ISOLA.

DECAPITATION.—No. 2.

BEHEAD a stratum and obtain a body of water; an animal and leave an animal; a dividend and leave a small animal.
☞ Answer in two weeks. PAUL BOYTON.

PUBLISHER'S SPECIAL NOTICES.

The Rural is a very good present to send to a friend, and it pleasantly reminds the recipient of the donor fifty-two times a year—this year fifty-three times. Any *subscriber* can send it to a relative or friend, as a present, at our lowest club rate—only $2.15, including postage.

Holiday Presents will be plenty this year among our Agent-Friends and others who form clubs for RURAL. Our list comprises many articles appropriate for presents. Induce a few of your friends to take the RURAL, and thus secure a Premium.

Officers of Agricultural Societies and Clubs, Granges, &c., can, if they will, materially aid in augmenting the circulation of the RURAL. Scores of such are already forming clubs; how many others will kindly do likewise?

Renew early if you would secure the uninterrupted continuance of the RURAL to your address; and pray don't forget to ask friends to join you in sending for the Fifty-three Numbers which we shall publish during 1876.

Back Numbers of this Year (from Jan. 1) can be furnished to all new subscribers, but we shall not send them hereafter unless specially requested. Those who desire can begin with any number, however.

The Best Paper, and the Best Premiums to Agents, is our motto. We ignore Chromos and all other cheap colored pictures, preferring to put our money *in the paper*, and in Premiums to Agents.

Select Your Premiums.—All persons entitled to Premiums will please designate what they prefer and notify us how and where to forward—whether by Freight or Express—if articles are not mailable.

Act as Agent!—Reader, if there is no agent for the RURAL in your locality please become one by forming a club. *It will pay.*

At Our Risk.—You can remit by Draft, P. O. Money Order or Registered Letter *at our risk.*

News of the Week.

A SEVERE WINTER STORM.

WEDNESDAY, Feb. 2, was marked by a violent gale which prevailed over a large portion of the United States. Parts of the Atlantic coast were strewn with wrecks, though timely warning from the signal office prevented the sailing of many vessels. On land the damage consisted chiefly in unroofing houses, but in several localities buildings were entirely destroyed. In Cohoes, N. Y., the steeple of St. Bernard's Church, 223 feet high, was blown down and destroyed. In Little Falls a Catholic Church, built four years ago and costing $40,000, was entirely demolished, and at Amsterdam, N. Y., St. Mary's Catholic Church had its steeple blown over, crushing in the building. The tornado in the Mohawk Valley is reported to be the severest ever known. At the west the gale was accompanied by intense cold, the thermometer at Mackinaw, Mich., going to 25 degrees below zero—much the coldest weather of the season. There was a sudden and rapid fall in temperature everywhere. At Poughkeepsie, N. Y., the thermometer fell 20 deg. in two hours. Considerable injuries to buildings are reported from Albany, Whitehall, Middletown and Ft. Jervis in this State; Providence, R. I., Baltimore, Md., and Halifax, N. S. In Fredericktown, Md., the spire of an Episcopal Church was blown over, crushing in an adjoining building. The velocity of the wind in this (N. Y.) city was sixty-six miles an hour, the greatest ever known here. Although the storm was a remarkable one, and following an exceptionally mild January, it undoubtedly ushers in a few weeks of more wintry and seasonable weather.

HOME NEWS PARAGRAPHS.

JERSEY CITY school-girls chased a loafer who had insulted them, and beat him with their satchels until he called upon a policeman for protection.

Silas Wilder, a farmer of East Lindon, Vt., killed both his parents, and severely wounded his wife, Feb. 2, while in a fit of rage. He then hanged himself.

An indictment has been found against Winslow, the Boston forger, in order that he may be arrested if he enters a country with which the United States have an extradition treaty.

The Grand Jury of the United States Circuit Court, at Milwaukee, has returned indictments against George Q. Erskine, ex-Collector of Internal Revenue, Leopold Wirth, distiller, and A. C. Zinn, rectifier.

The Rhode Island House of Representatives has passed a bill providing that buildings owned, but not actually used by churches, schools, colleges and charitable institutions, shall no longer be free from taxation.

There are six colleges in the State of Tennessee; the State University at Knoxville; the Baptist University at Jackson; the Cumberland University (Presbyterian) at Lebanon; the Southwestern Presbyterian University, formerly Stewart College, at Clarksville; the Southern College at Sewanee, supported by the Episcopal Church of the South: and Vanderbilt College, just established by the Methodists, with ample endowments, at Nashville.

It is reported in the Courier-Journal that Col. William Cassius Goodloe of Kentucky is about to settle in Washington, and will take there with him four thoroughbred horses to draw his coach.

An audacious young man attended Mrs. Miller's materializing seance in Memphis and suddenly turned the light of a dark lantern on the form of a supposed apparation, disclosing the medium to the sight of the company.

Mr. John Muir says that there are sixty-five glaciers in the mountains of California. One of them he watched forty-seven days and in that time it moved 46 inches. Yosemite and similar valleys were dug out by glaciers.

There is excitement in Pickens county, Ga., about the killing of a citizen by a United States soldier. The soldiers were engaged in a raid on an illicit still, and one of them shot the citizen in the mouth, killing him instantly. Several prisoners were taken by the military, and one of the prisoners declared that the soldier was altogether at fault, and that the killing was murder. The Sheriff of Pickens county overtook the soldiers with a posse of armed men, and demanded and arrested the one who fired the fatal shot.

The House Committee on Appropriations completed the Fortification bill Feb. 3, appropriating for the protection, preservation, and repairs of fortifications and other works of defense, $100,000; for conversion of heavy ordnance, $100,000; for projectiles of heavy ordnance, $25,000; for carriages for heavy guns, $15,000; for proving ground and proving canon, $25,000; for torpedoes, $50,000. The estimates were $3,000,000, but the Committee cut down the appropriations to $315,000.

It is stated on the authority of Judge Gilbert and the clerk of the Supreme Court, that Judge Dykeman has granted a writ of *habeas corpus* for Edward S. Stokes.

The Atlantic & Pacific Telegraph messenger boys of Rochester, N. Y., have put on a gray uniform. The Western Union boys will soon be uniformed in blue; and thus will the blue and the gray be revived.

A number of persons are under arrest in Buffalo, N. Y., charged with defrauding the poor department. They procure orders for railroad passage, raise them, and sell them.

The ice companies are making arrangements to run ice trains on the New York, Kingston & Saratoga railroad, bringing ice from ponds, lakes and mountain streams along that picturesque route to tide-water at Rondout, where barges will be in waiting to carry it to New York.

About 7 o'clock on the morning of Feb. 3rd, flames shot forth from the building at 30 Beekman St., New York City, occupied chiefly by Norman L. Munro, publisher of the Family Story Paper, Dime Novels, &c. On the previous night a fire had been extinguished in the same building. The fire in the morning gained great headway before the engines could get fairly at work. The warehouse at 28 Beekman St. soon caught fire and the druggists' supplies in the basement added to the intensity of the conflagration. A second alarm was sent out and six more steamers soon arrived, but the fire was not extinguished until Mr. Munro's place had been utterly ruined and the adjoining warehouse badly damaged. The buildings at 28 and 30 Beekman St. were leased by Norman L. Munro. No. 28 is a five-story and basement brick building, owned by Mrs. Henry, and worth $30,000. The loss, from $10,000 to $20,000, is covered by insurance. No. 30 is owned by the John Clapp estate, and damaged about $15,000; fully covered by insurance. The other losers are Norman L. Munro, $40,000, insured for $16,000; Clement & Stockwell, paper dealers, $40,000, insured for $30,000; Theodore Rickseeker, druggist, stock worth $35,000, partially destroyed, insured for $23,000; James M. Owens, loss $5,000, insured for $11,000 on stock said to be worth $20,000; Frank Morris, compositor, loss $2,500, partly insured; Robert Jackson, compositor, loss $3,000, insured. The stock of Frederick H. Levy & Co., manufacturers of inks and varnishes, who occupied the front part of the first floor of No. 32, was slightly damaged by water. In the office of the Church Union, on the same floor, the desks and papers were badly damaged by water. Clayton & Pagan, printers, occupied the rear part of the second floor in the same building, and sustained a slight damage from water. The fourth and fifth floors were occupied as a pamphlet bindery by Randall & Tomlinson, and their stock was damaged about $500.

A bill will come before the Main Legislature at an early date to allow the Maine Central road to connect its depots at Lewiston; also a bill to allow the same company to discontinue its road from Leeds to Crawley's Junction.

The Albany Fire Department has appointed a committee to report a plan of organization for a Mutual Benefit Association. It is proposed to allow all employes, department telegraph operators, commissioners, and exempt firemen to join.

At Auburn, Jan. 31, John McCalpin, a Sing Sing transfer, fatally stabbed, without provocation, Frank H. Meredith. McCalpin was the chief conspirator in the fan- -s attempt to escape on a sloop from Sing Sing, at which time he was shot and recaptured. He is considered one of the worst and most dangerous felons in the country.

Three of the jury who convicted Samuel McKee of complicity in whisky frauds were subscribers to his paper. This is doubly rough on the journalist. It is bad enough to have subscribers go back on the publisher of their own paper, and then, what must be thought of a journal whose regular readers and patrons are not too intelligent for jury duty?

Mrs. Elizabeth Trimmer of Huron Co., Ohio, died on the 18th of January. She was born on the Fourth of July, 1776, and it was the intention of her friends to have her attend the Centennial Exhibition.

Mr. George William Curtis is supplying the pulpit of the Church of the Redeemer, Staten Island, as a lay reader, and he has of late read to the congregation on Sunday mornings from the sermons of Rev. Stopford Brooks of London.

The statue of Samuel Adams, which Massachusetts has ordered for the National Gallery, as a companion statue of Winthrop, is nearly finished, and will reach Boston in April.

A German boy, sixteen years old, named Henry Lange, hung himself in Cincinnati last week because of homesickness.

At the Centennial Tea Party on the evening of Feb. 3d, in the chapel of Dr. Scudder's Central Congregational Church, Brooklyn, the gauze used on the stage for better scenic effect took fire, the whole airy fabric at once being in a blaze. Several members of the Twenty-third regiment, taking part in the performance, at once pulled down the fragments and stamped out the fire. Others pacified the audience, enjoining nervous and frightened people to keep in their places and remain quiet. Fortunately all was soon over without serious results.

Hon. John W. Kingman, formerly United States Judge, of Wyoming, reports that since women have been admitted to the suffrage there has been a change from the former noisy, disorderly, and disreputable scenes to the "quiet of a religious meeting." He thinks that hardly a dozen men could be found in the Territory to favor depriving women of the suffrage.

As an illustration of the sudden rise of towns in some parts of California, an exchange cites the town of Winter, in Vacan valley. Last year a crop of grain was taken off the town's present site and a settlement there was not dreamed of. Now there are 1,200 inhabitants on the spot and town lots are selling for $600 each.

General Sherman writes: "I have never been, am not now, and never shall be a candidate for the high office of President before any convention of the people."

The extensive preparations for the Moody and Sankey revival meetings in this city were completed last week.

Moses H. Hale, for many years a special agent of the Treasury at Washington, has been appointed the successor of Colonel Frank E. Howe, as chief special agent of the United States Treasury.

A call is issued for a Greenback Convention to be held in New Haven, Feb. 22, the object of which is announced to be to take such steps as it may deem necessary to force both of the political organizations of the State to recognize the voice of the people in the coming campaign.

Encouraging accounts come from the Argegtine Republic. Commerce is reviving, immigration is increasing, and 304 miles of the railroad across the Andes have been built. It is satisfactory to learn that this progressive Republic will be well represented at the Centennial Exhibition, the Argentine Congress having voted a sum of money for that purpose.

FOREIGN NOTES.

GREAT preparations are making at Naples for the carnival, which will last from the 20th to the 28th of February—the first since the overthrow of the Bourbons.

John Bright urges on English Liberals a platform of three radical planks. The extension of manhood suffrage to boroughs where a high property qualification is required. This would enfranchise agricultural laborers, as the mechanics and artisans of the towns already are enfranchised. Secondly, he would have a redistribution of parliamentary seats based on population. This would unseat many members, some of them Liberals, who represent insignificant constituencies, and for this reason this reform will not be adopted. The third plank is a reform in the monoply land laws and the abolition of primogenitureo and entailed. This would be violently opposed by a majority of the House of Lords. Altogether, radical ideas have quite a fierce opposition and encounter as many difficulties in England as on this side of the water.

Advices from the Cape of Good Hope report that the Zambesi Mission have succeeded in placing a steamer on Lake Nyanza. Seven hundred natives were employed to carry the vessel past the Murchison Cataracts.

Sir John Glover has returned to England from Paris. His proposition to buy the French fishery rights in Newfoundland was declined. He stated that the French authorities show considerable resentment at the discussion of the subject by the English press.

The London Post's Berlin dispatch states that the Northern Powers have again jointly remonstrated with the Prince of Montenegro for countenancing the insurrection, and for allowing an indiscreet address threatening war with Turkey to appear in his official journal.

A London Telegram says that the Hon. F. R. Plunkett, now Secretary of the British Legation at Yedo, has been appointed to the same post at Washington. Mr. Plunkett has been in the diplomatic service 21 years, having been connected with some of the principal British Legations in Europe.

An official cable dispatch from Madrid was received at the Spanish Legation at Washington, Feb. 3, stating that as a result of the latest operations in the North the Alfonsist forces have almost entirely gained possession of the Provinces of Biscay and Alava. Gen. Martinez-Campos occupies the whole Valley of the Bistan, intercepting the communication of the Carlists with France. The army of King Alfonso is now in the hills of Santa Barbara, which command the Carlist stronghold, Estella.

It is said that Ali Pasha has offered to cede to the Prince of Montenegro the districts of Sutorina, Zubzi, and Bagagni, in Herzegovina, and the Albanian port of Spitza, if the Montenegrins withdraw aid from the insurgents and military operations are suspended.

Three "three-card monte" men were recently sentenced at Tours, France, to two years' imprisonment and fifty francs fine each, for "taking in" several passengers in first-class carriages of the Orleans Railway. A contractor named Doucet lost 21,200 francs, and M. Notte, a Bordeaux student was swindled out of 300 francs.

At a recent Consistory the Pope nominated 22 Bishops, including Carmenel, Bishop of Martinique; Payn, Bishop of Manilla; Moran, Bishop of St. Hyacinthe, Canada; and Tuigg, of Pittsburgh.

A revolution has broken out in Hayti.

An Italian paper states that Bismarck has asked through the foreign office the opinion of the Italian counsel of state with reference to the judicial question raised by the publication of official documents by Arnim.

Steamers arriving at Liverpool from America report very heavy weather from the 21st to the 29th of January. The steamer Gellert of the Hamburg-American Line, Alexandria of the Anchor Line, and City of New York of the Inman Line, felt it severely. The last two had their boats and skylights stove.

Advices of Feb. 3 state that the Alfonsists have occupied Echalar and Fesaca, and are advancing on both sides of the river Bidassoa toward Vera. The Carlists have destroyed all the bridges.

Later advices report that Count Caserta, with considerable reinforcements for the Carlists, having arrived at Vera, the Alfonsists have abandoned Lesaca and Echalar, and are falling back on Urdax, Maya and Elizondo.

Don Carlos has appointed Gen. Cavero in place of Gen. Dugate, and Gen. Lizarraga in place of Cavero.

There were 1,668 fires in London during 1775, a decrease of forty-four as compared with the previous year. In twenty-six instances lives were lost.

Silver-mounted rosaries, religious medals, and the like, to the value of $1,000,000, are sold annually in France.

The Archbishop of Paris has received from the Archbishop of Beyrout 12 large planks of cedar cut from a tree on Mount Lebanon that had recently blown down. A few trees yet remain, supposed to be as old as the time when Solomon built the Temple.

The French boys were all tipsy on Jan. 28th, in honor of Charlemagne, who died on that day 1,062 years ago, and who was greatly opposed to drunkenness in his time.

The Alfonsist successes are very marked. The Carlists have been outflanked, and the Alfonsists are marching into Navarre.

The marriage of His Royal Highness the Duke of Connaught, Prince Patrick, to the Princess Marie, niece of the German Emperor, is rumored.

The Prince of Montenegro received a Turkish envoy coldly, and refused to act against the insurgents.

The Baring Brothers of London will take up the interest bonds provided for at the meeting of the Eastern Railroad stockholders at Boston on the 15th of January, and pay full interest on the £600,000 bonds issued by them as usual on the 1st of March and the 1st of September, 1876.

The Hour (London) understands that only about one-twelfth of the Erie bond and shareholders assented to the scheme of Sir Edward Watkin; consequently Messrs. Miller and Fleming, representing the Dundee bondholders, have gone to New York to arrange the other scheme.

A Naples despatch, Feb. 2, says the indications of the eruption of Mount Vesuvius are steadily increasing. Prof. Palmieri announces that the instruments of the observatory for indicating and measuring the eruptions are disturbed, and the activity of the crater is becoming daily more apparent. A speedy eruption is generally expected. The number of strangers is increasing, though the city is not crowded. English and American patronage has been much less than usual this winter. Many of the hotels have not paid expenses.

A dispatch from London, Feb. 4, says that Captain Mildmay has not yet heard from Sir Henry Halford about the rumored change in the arrangements for the international contest. The Captain says he has received no orders to call the Council of the National Rifle Association, as the answer from New York to the resolution adopted on the 22d of January is still awaited. Captain Mildmay thinks, and he has heard Sir Henry Halford say, that if New York decides to admit separate teams from England, Scotland Ireland, the National Association will not send a team.

Prince Louis of Batternburg, Hesse Darmstadt, who is with the Prince of Wales in India, was on Feb. 3, severely though not seriously injured by a fall from his horse while hunting wild boars,

THE SEASON, CROPS, PRICES, ETC.

Salado, Bell Co., Texas, Jan. 18.—Weather fine for the season, and in looking over my garden I see Narcissus almost ready to bloom. *Spiraea Reevesi* is a wreath of snowy-white flowers. *Lanicera Japonica nivea* is covered with delicate fragrant flowers. Yet, while I look upon this scene, my thoughts travel up to my early home in the Empire State, where perhaps many a RURAL reader is gazing out upon bleak hills and snowbanks.—E. G. M.

Ridgewood, Bergen Co. N. J.—Everybody happy over the fine weather but the teemen, who begin to fear a short crop. Perhaps their customers will also feel the pinch next summer when the mercury stands 90 deg. in the shade, lumps of ice scarce and melted butter plenty. The warm weather has, however, brought down the price of coal and wood, which is a blessing to consumers. Winter grain looks well, as it has not been cold enough to injure it, although not protected by snow as usual at this season. Farmers have done some plowing and are preparing to do more if the weather continues mild. Live stock look well and happy, but the boys have hung up their skates and taken to playing ball.—A. S. F.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Feb. 5, 1876.

RECEIPTS.—The receipts of Produce for the week were as follows:

Flour, bbls	65,413	Pork, bbls	4,502
Whisky	2,478	Cut meats, pkgs	12,076
Corn meal, bbls	1,805	Lard, pkgs	10,789
Corn meal, bags	5,142	Tar, bbls	—
Wheat, bush	121,035	Tobacco, hhds	1,576
Corn, bush	253,089	do. cases	2,045
Oats, bush	83,314	Butter, pkgs	30,005
Rye, bush	960	Cheese, bxs	19,234
Malt, bush	45,026	Cotton, bales	18,555
Barley, bush	52,100	Rosin	1,987
Beans, bbls	2,123	Spts. turp., bbls	225
Grass seed, bags	6,989	Dried Fruits, pkgs	851
Ashes, pkgs	120	Eggs, bbls	10,672
Beef, pkgs	5,007	Peanuts, bags	3,151
Peas, bush	61,120	Dressed Hogs	3,512
Wool, bales	1,058	Oil Cake, pkgs	8,381
Hops, bales	3,015	Rice, bbls	1,153

BEANS AND PEAS.—There has been a fair export trade in marrows, and prices are 5c. better for prime parcels in good shipping condition. Medium beans sell so lightly in proportion to the stock and receipts that they continue weak, not bringing the extremes of last week for lots at the stations. Limas were never so plenty. They have been so long regarded as a luxury that buyers hardly know what the low prices for them mean. Red kidneys are somewhat more active, buyers have been out of market so long that they are forced to replenish. White kidneys are easier. Canadian peas are steady for bulk and a shade easier for bbls. Green and B. E. peas quiet.

We quote Beans, pea, new, prime, $1.50@1.60; other, 1.25@1.35; medium, new, $1.40@1.45; fair to good, $1.15@1.30; very poor, 50@2c.; marrow, new, prime, $1.70@1.75; other, $1.40@1.60; white kidney, prime, $1.85@1.95; fair to good, $1.60@1.70; red kidney, new, prime, $1.50@1.60; fair to good, $1.30@1.45; California Lima, choice, $3.50@3.60. Peas, Canadian, bbls., new duty paid, $1.25@1.27; bulk, in bond, $1.02@1.03; green new, ⅘ bush., $1.50@1.60; Southern B. E., ⅘ 2 bush. bag, $3.10@3.15.

Exports of beans since Jan. 1st, 4,067 bbls.; of peas, 92,695 bush.

BEESWAX.—Small sales are at 31@32c. for Western, and 32@33c. for Southern.

BROOM CORN.—There has been no further large movement.

We quote Brush, short green, 10@11c.; hurl, green, 8½@10c.; green, medium, 5@7c.; red and red-tipped, 3@4c.

BUTTER.—There are no quotable new features in the butter trade. Choice State continues firm, and as it does not arrive liberally, and the store reserve here has been greatly reduced, lots suitable for fancy trade are quoted a shade higher. This class of business, it must be remembered, does not represent the trade that clears up the stock. There are a good many dairies here and to come that will depend upon a late spring for hardness of quotations. Just now the medium trade is working as freely as it can in Western, paying 24c. for what may be called fine; but the chief inquiry is for sound 18@20c. stock. Western rolls have been unusually abundant this season, and very low prices still rule. They must be sweet, solid and cloth-wrapped to bring 20c.

State dairies entire, extra, 31@32c.; entire, good to prime, 24@30c.; fair to good, 25@27c.; firkins, selected fresh, 31@32c.; good to prime, 27@29c.; fair to good, 24@26c.; half-firkin tubs, selected, 35@37c.; good to prime, 31@34c.; fair to good, 27@30c.; poor to fair, 25@27c.; State, Welsh, tubs, full made, 30@31c.; dairies, 27@29c.; good to prime, 25@27c.; fair to good, 24@25c.; poor to fair, 22@23c.; Pennsylvania, store packed, 17@26c.; Western, dairy tubs, selected, 26@27c.; good to prime, 24@26c.; tubs selected fresh, 26@27c.; good to prime, fresh, 24@25c.; fair to good, fresh, 21@23c.; poor to fair, fresh, 20@21c.; Western, early packed, selected, 21@22c.; Western, early packed, other, 18@20c. Roll butter, good to prime, 18@21c.; fair to good, 14@17c.
